In handling the coal-producing industry the government had to face all of the great problems and all of the little details that were certain to exist in an industry loosely organized, many of whose units were unscientifically directed and were deficient in knowledge of fundamental business and commercial practices. It faced an aggregation of unrelated units, large and small intermingled, with little if any uniformity of action where true cost accounting was not generally in force. It confronted an untrained army of producers where price had run exorbitantly rampant. It found production highly stimulated by abnormally heavy demand from every center of consumption. On top of these conditions, entering them as a bomb might fall into a intensified war-industry factory, there came price fixing, widely advertised differences of opinion between Cabinet officers, advice to consumers not to pay the prevailing market figures but to hold off. And government legislation and ukase followed; prices were fixed only to be advanced when their inadequacy was proved. In short, the conditions which developed rapidly in the production end of the problem were complete demoralization. Producers did not know "where they were at."

THE ALL-IMPORTANT TRANSPORTATION PROBLEM

On the monumental issue of transportation the government had before it a condition made up of different factors but all pointing to the entire breakdown of facilities which was so sharp an outstanding feature of the internal situation in 1917. Railroads were years behind their normal construction programs in cars and locomotives, trackage and terminal capacity. The rates were inadequate. They were not even properly equipped to handle normal business, let alone normal business plus war requirements. They had neither the facilities nor the credit for buying the facilities. In brief, they were helpless to move coal and other traffic with the sure expedition which war demanded.

Both of these factors—production and transportation—together with the collateral one of distribution, the government now has entirely in its hands through the

THE largest and best-managed electric light and power stations that are burning coal are using it with the greatest economy known in engineering practice. Considering the fluctuating demand for energy, it is not to be expected that by any changes of apparatus they can make any further important saving of coal. The smaller sta-

tions and those that are not up to date in the equipment and methods of management can make a great saving of coal by acquainting themselves with what is being done in the best plants and copying them as far as possible.—*United States Fuel Administration in the ELECTRICAL WORLD*, Jan. 5, 1918.

Fuel Administrator and his representatives in all sections and the Director General of Railroads. All power is in the government, but the events of the times show clearly that power alone is not enough to bring cheery brightness out of the gloom of coal supply conditions. Optimism alone will not do it. Clear-sighted wisdom is necessary, not alone in the high seats at Washington, but also throughout the country wherever co-operation can be given. Orders can be issued at Washington, but much more than that is required in a democracy even in time of war. Large planning, foresight, broad vision, plain justice to worker and capital are required in order that the unaccustomed regulations may yield fruit.

MISGIVINGS OVER GOVERNMENT CONTROL OF MINES

Not without many misgivings has the electrical industry seen the sweep of government control over coal mines. There are differences of opinion in the electrical industry concerning the benefits or detriment of such control. In part, they are based on ideas of policy, in part they are based on intimate contact with coal-producing areas and on observation of conditions therein. Generally the electric central stations reached in the ELECTRICAL WORLD canvass merely accept the act of government control without comment and base their remarks on the condition thus imposed on them. In other cases there is sharp criticism of the effect of government control, as the following expressions show:

I have never heard of the government taking any co-operative steps that had any value to the consumer of our type. In fact, if the government would step down and would let the coal people take care of themselves, I am sure that they would be quite capable of handling it, but the government is not. In my judgment the same thing applies to transportation. From my limited experience with the government in this connection, I think it is 90 per cent responsible for this coal entanglement that we are all in, and I now it is directly responsible for reduction in output in some coal fields by many hundred thousands of tons.

In our judgment the government has taken a very unwise step. It has put in new men to handle the coal proposition, crowding out men who have spent their lives in coal operation. I do not think there is any difficulty in producing all the coal, and more coal, than can possibly be handled by the transportation agencies. Many of the railroads are up against it seriously owing to crippled condition of engines and bad condition of crews. Labor at this time is something never before known. Our laborers are not interested in their work; they only think of the mighty dollar and are afraid they are not getting their share. I believe if assistance could be had from Western roads in rolling stock, especially engines, the coal mines would be able to supply all the requirements made upon them. I also believe, as stated, that these matters should be put in the hands of men who have spent their lives in the industry and know quality and conditions of coal.

The series of articles which is now completed was prepared in the hope that it would result in constructive policies to better the coal-supply conditions. It has presented the point of view of many companies, enormous consumers of coal, and has covered generally all

phases of the subject. As bearing particularly on the vital mining and producing features the comment of one company is illuminating. Its constructive suggestions are the result of long-continued observation of coal conditions at short range and of experiences which have been particularly trying during the last winter. Like many other companies, this property has partially met the increased coal cost by a fuel differential added to power rates. This differential was intended to cover the increased cost of fuel and would do so if the fuel were of normal value and quality. It, however, applies at the best to only about one-half of the output, and therefore increased cost of coal has caused a very considerable decrease in the net earnings of the company. The general manager says:

To obtain relief I believe that government conscription of labor will be required. This is especially true of the coal mines. The wages now paid to the miners are the highest in the history of the country. The miner will work until he acquires about a certain weekly wage. In other words, the more you pay him the less time he will work. If he earns sufficient money for his food, his rent, what little clothing he requires and enough beer to last him through the idle time, he quits. As a consequence, the higher the wages the less the production. The coal producer is largely unable to improve conditions without material support and protection from interruptions, annoyances and losses due to labor disturbances.

The transportation agencies can help and could better themselves in various ways, as by the pooling of coal, so that instead of one mine furnishing one particular customer or more, etc., necessitating gathering a few cars from this mine and a few cars from that mine, taking them to classification yards, and there sorting them into trains in accordance with the destination, the coal can be taken directly from the mines to users without entering the classification yards. This would necessitate, of course, a sort of coal-clearing house and would mix qualities up for the time being, but it is also equally certain that classification yards now have standing in them many cars filled with coal awaiting classification and freight movement.

I believe that every classification yard and many sidings in their yards all through the great coal district and between that district and the lakes will, on investigation today, be found filled with coal cars awaiting movement.

Part of the trouble the railroads are to blame for; part the miners are to blame for; part the manufacturers and utilities are to blame for. To illustrate—suppose that a mine and a utility were located at point "A" or reasonably contiguous to point "A" and that a mine or utility were located at point "B" or reasonably contiguous to point "B," with a distance between point "A" and point "B" of one hundred or more miles; does not it look foolish for the coal from point "A" to be used by the manufacturer or utility at point "B" and vice versa? Yet that is practically just what is happening—not in one case but in hundreds.

Standing near the tracks in any one of the large coal-producing districts, you will see heavy freight loads of coal pass from time to time, some going in one direction—some in the other. Why is this cross movement necessary to such an extent? Of course, the answer is that part of the movement has come about by the preference of a certain manufacturer for certain coal; part has come about by judicious railway business handling to obtain traffic; part perhaps from various causes. It is a fact, however, that exists.

ANY one who has had the responsibility of having 140 to 150 carloads of coal for use at the generating stations every morning during the past three or four weeks realizes the coal situation. My conclusion is that in Illinois, at least, our railroads had been strong, if their terminals had been developed as they should have been for

the size of their communities, if they had had the cars and the motive power, we would not have been brought to these five fuelless days.—*J. F. Gilchrist, vice-president Commonwealth Edison Company, Chicago, in an address before the Indiana Engineering Society, Indianapolis, on Jan. 25, touched on railroad unpreparedness.*

Self-Inductance of Long Reactance Coils

Development of Practical Engineering Formula for Computing This Value, with Two Examples Which Are Worked Out in Order to Illustrate the Application of the Method

BY H. B. DWIGHT

FOR the calculation of the self-inductance of circular coils used in engineering work three formulas are needed to cover the range. These are, first, a formula for long coils, in which the length b (Fig. 1) is greater than the mean diameter d ; second, a formula for short coils, in which b is less than d but greater than the thickness c ; and, third, one for flat coils, in which b is less than c . In this article an engineering formula (4) for long, thick coils is described, and other formulas for long coils are presented which may be useful for special calculations but which are probably not required for engineering work. Engineering formulas for short and flat coils will be given in a future article.

As indicated below, all the dimensions of a coil should be measured to the pitch lines of the conductors. Thus the length of the coil should be taken as the number of conductors per layer multiplied by the pitch of

SECTION OF REACTANCE COIL

the conductors. The exact dimensions over the copper are slightly too small and should never be used.

In order to obtain an expression for the self-inductance of a thick cylindrical coil, it is first necessary to know the mutual inductance of two coaxial and concentric thin solenoids of equal length. For long solenoids this has been given in a useful form by T. H. Havelock.¹

By using the form in elliptic integrals given in equation (4) of Havelock's paper in the *Philosophical Magazine*, and by changing to the dimensions shown in Fig. 1, the expression for mutual inductance becomes:

$$M = \frac{\pi^2 d^2 N^2}{b^3} \left[b - \frac{2D}{3\pi d^2} \left\{ (D^2 + d^2) E - (D^2 - d^2) F \right\} - D \left\{ -\frac{1}{8} \frac{D}{b} + \frac{1}{128} \left(1 + \frac{d^2}{D^2} \right) \frac{D^3}{b^3} - \frac{1}{1024} \left(1 + 3 \frac{d^2}{D^2} + \frac{d^4}{D^4} \right) \frac{D^5}{b^5} + \frac{5}{2^8} \left(1 + 6 \frac{d^2}{D^2} + 6 \frac{d^4}{D^4} + \frac{d^6}{D^6} \right) \frac{D^7}{b^7} - \dots \right\} \right] \quad (1)$$

where d and D are the diameters of the two thin solenoids, where N is the number of turns on each solenoid,

and where F and E are complete elliptic integrals of the first and second kinds, to modulus d/D .

The two elliptic integrals can be expanded in terms of the complementary modulus, K' , as follows:²

$$E = 1 + \frac{1}{2} K'^2 \left(\log h \frac{4}{K'} - \frac{1}{1.2} \right) + \frac{1^2 3}{2^2 4} K'^4 \left(\log h \frac{4}{K'} - \frac{2}{1.2} - \frac{1}{3.4} \right) + \dots \quad (2)$$

$$F = \log h \frac{4}{K'} + \frac{1^2}{2^2} K'^2 \left(\log h \frac{4}{K'} - \frac{2}{1.2} \right) + \frac{1^2 3^2}{2^2 4^2} K'^4 \left(\log h \frac{4}{K'} - \frac{2}{1.2} - \frac{2}{3.4} \right) + \dots \quad (3)$$

$$\text{where } K' = \sqrt{1 - K^2} = \sqrt{1 - \frac{d^2}{D^2}}.$$

The expression for mutual inductance can now be integrated twice over the section of the thick coil indicated in Fig. 1, and the following engineering formula for the self-inductance of a long thick coil is obtained:

$$L, \text{ in henries,} = \frac{\pi^2 d^2 N^2}{0.3937 \times 10^6 b} \left[1 - \frac{2}{3} \frac{c}{d} + \frac{1}{3} \frac{c^2}{d^2} - \frac{4d}{3\pi b} \left\{ 1 - \frac{1}{4} \frac{c^2}{d^2} \log h \frac{4d}{c} + \frac{23}{48} \frac{c^2}{d^2} \right\} + \left(\frac{1}{8} + \frac{1}{12} \frac{c^2}{d^2} \right) \frac{d^2}{b^3} - \left(\frac{1}{64} + \frac{7}{192} \frac{c^2}{d^2} \right) \frac{d^4}{b^5} + \left(\frac{5}{1024} + \frac{17}{768} \frac{c^2}{d^2} \right) \frac{d^6}{b^7} - 0.00214 \frac{d^8}{b^9} + 0.00112 \frac{d^{10}}{b^{11}} - 0.00066 \frac{d^{12}}{b^{13}} + \dots + \frac{2b}{\pi q d N} \left(\log h \frac{p}{w} + 0.14 \right) \right] \quad (4)$$

In this formula N is the number of turns of effective conductor in the coil, q is the number of wires or cables in parallel, and the dimensions are in inches. If the dimensions are in centimeters, the factor 0.3937 should be omitted. (Note that $\log h m =$ the hyperbolic or natural logarithm of $m = 2.3026 \log_{10} m$.)

It is assumed that the coil is wound with round wire or cable. For square wire the constant 0.14 in the last term should be omitted. The general term of the series in d/b , omitting the terms in c , is

$$\frac{(-1)^n (2n)! (2n+2)!}{n! (n+1)! (n+1)! (n+2)! 2^{2n+2}} \left(\frac{d}{b} \right)^{2n+2}$$

By putting $c = 0$ and omitting the last bracket, formula (4) becomes the same as Havelock's expression for the self-inductance of a thin solenoid.

If the more usual expansions of the elliptic integral in powers of the modulus k are used, the following formula for the self-inductance of a long thick coil is obtained:

¹*Philosophical Magazine*, March, 1908, p. 340, equation 25; and *Bulletin of the Bureau of Standards*, Vol. 8, No. 1, 1911, p. 56, equation 38.

²*Bulletin of the Bureau of Standards*, Vol. 8, No. 1, by E. J. Rosa and F. W. Grover, p. 8, equation 3.

$$\begin{aligned}
 L, \text{ in henries} = & \frac{2\pi^2 N^2}{0.3937 \times 10^9 b^2} \left[\frac{1}{3} r^4 - \frac{4}{3} r s^2 + s^4 - \right. \\
 & \frac{1}{b} \left(0.2441272 r^5 - \frac{2}{3} r^2 s^3 + 0.4277559 S^5 + \frac{1}{10} s^4 \log \frac{r}{s} \right) + \\
 & \frac{s^4}{b} \left(0.004464 \frac{s^2}{r^2} + 0.000543 \frac{s^4}{r^4} + 0.000129 \frac{s^6}{r^6} + \dots \right) + \\
 & \frac{1}{9b^2} (r^2 - s^2)^2 - \frac{1}{30b^2} (r^2 - s^2) (r^2 - s^4) + \\
 & \frac{1}{84b^2} (r^2 - s^2) (r^4 - s^4) + \frac{3}{200b^2} (r^4 - s^4)^2 - \\
 & \frac{5}{864b^2} (r^4 - s^4) (r^2 - s^2) - \frac{3}{112b^2} (r^4 - s^4) (r^4 - s^4) + \dots + \\
 & \left. \frac{bc^2 d}{\pi q d N} \left(\log \frac{p}{w} + 0.14 \right) \right] \quad (5)
 \end{aligned}$$

The general term of the power series in s/r in the above formula is

$$\frac{(2n-1)!(2a+1)!}{n! n! (n+1)! (n+2)! (2n+5)2^{2n}} \frac{s^{2n}}{r^{2n}}$$

Formula (5) is especially applicable to very thick coils, even those with the internal diameter equal to zero; but as it is long and not easy to apply to thin coils, it does not seem as generally useful as formula (4), which is probably sufficient for the calculation of long coils in engineering work.

PRECISE CALCULATION FOR MODERATELY THICK COILS

The following extended form of formula (4) gives a precise method of calculation of the self-inductance of long, moderately thick coils:

$$L, \text{ in henries} = L_s + \Delta L,$$

where L_s is the self-inductance of an infinitely thin coil, or cylindrical current-sheet, of diameter d , and where ΔL is the correction due to the thickness of the coil and the spacing of the conductors. L_s may be calculated by formula (4), omitting the terms in c and the last bracket, or it may be accurately found from Table XXI, *Bulletin of the Bureau of Standards*, Vol. 8, No. 1.

$$\begin{aligned}
 \text{Then } \Delta L = & \frac{\pi^2 d^2 N^2}{0.3937 \times 10^9 b} \left[-\frac{2}{3} \frac{c}{d} + \frac{1}{3} \frac{c^2}{d^2} + \frac{4d}{3\pi b} \right. \\
 & \left\{ \left(\frac{1}{4} \frac{c^2}{d^2} - \frac{1}{80} \frac{c^4}{d^4} \right) \log \frac{4d}{c} - \frac{23}{48} \frac{c^2}{d^2} + \frac{1}{1600} \frac{c^4}{d^4} + \dots \right\} \\
 & + \frac{1}{8} \frac{d^2}{b^2} \left(\frac{2}{3} \frac{c^2}{d^2} + \frac{1}{9} \frac{c^4}{d^4} \right) - \frac{1}{32} \frac{d^4}{b^4} \left(\frac{7}{6} \frac{c^2}{d^2} + \frac{13}{30} \frac{c^4}{d^4} + \dots \right) \\
 & + \frac{1}{32} \frac{d^2}{b^2} \left(\frac{17}{24} \frac{c^2}{d^2} + \frac{169}{240} \frac{c^4}{d^4} + \dots \right) - \\
 & \frac{1}{32} \frac{d^4}{b^4} \left(\frac{775}{1536} \frac{c^2}{d^2} + \frac{2167}{2304} \frac{c^4}{d^4} + \dots \right) + \dots + \\
 & \left. \frac{2b}{\pi q d N} \left(\log \frac{p}{w} + 0.14 \right) \right] \quad (6)
 \end{aligned}$$

If the coil is so thick that the terms in c^4/d^4 in formula (6) are not extremely small, thus indicating that further terms of the series ought not be neglected, then formula (5) should be used instead of (6).

For precise work the constant 0.14 in the last term, which is an average value, should be changed in accordance with Dr. E. B. Rosa's results for various shapes of coils, given in the *Bulletin of the Bureau of Standards*, Vol. 3, 1907, page 37, and Vol. 8, No. 1, 1911, page 141.

The results of formulas (4) and (6) are the same,

except for one coefficient, as those of a method published by S. Butterworth,² giving three corrections to be added to the current-sheet formula, to obtain the self-inductance of a thick coil. The coefficient in that method which is not in agreement with formula (6) is $-1/9 \times 2167/80$ (equation 23), which, when changed to the notation of this article, becomes $-1/32 \times 2167/11,520$. The corresponding term of formula (6) is

$$-\frac{1}{32} \times \frac{2167}{2304} \times \frac{c^4}{d^4} \times \frac{d^2}{b^2}$$

In both methods of calculation this term is derived from the same quantity, namely,

$$-\frac{5}{864b^2} (r^2 - s^2) (r^4 - s^4) - \frac{3}{112b^2} (r^4 - s^4) (r^4 - s^4)$$

By putting $r = \frac{1}{2}(d+c)$ and $s = \frac{1}{2}(d-c)$ it is seen that the correct coefficient is $-1/32 \times 2167/2304$ as in formula (6).

Problem I.—To find the self-inductance of a coil with 1000 turns of round wire in ten layers of 100 turns each. The diameter of the insulated wire is $p = 0.1$ cm. and the diameter of the bare wire is $w = 0.08$ cm. The mean diameter of the coil is $d = 10$ cm., the length is $b = 10$ cm., and the thickness is $c = 1$ cm. (Example 1, *Bulletin of the Bureau of Standards*, Vol. 4, No. 3, page 374.)

Formula (4), omitting the terms in c and the last bracket, gives the value of L_s , the inductance of a thin coil of diameter $d = 10$ cm. Thus

$$\begin{aligned}
 L_s = & \frac{\pi^2 \times 10 \times N^2}{10^9} [1 - 0.4244 + 0.1250 - 0.0156 \\
 & + 0.0049 - 0.0021 + 0.0011 - 0.0007] = \frac{\pi^2 N^2}{10^9} \times 0.6882.
 \end{aligned}$$

The remaining terms of formula (4) are

$$\begin{aligned}
 \frac{\pi^2 N^2}{10^9} [-0.0666 + 0.0033 + 0.0039 - 0.0020 + 0.0008 \\
 - 0.0003 + 0.0002 + 0.0002] = -\frac{\pi^2 N^2}{10^9} \times 0.0605.
 \end{aligned}$$

$$\text{Thus } L = \frac{\pi^2}{100} \times 0.6277 = 0.06194 \text{ henry.}$$

This is less than one-fifth of 1 per cent different from the value given in the bulletin referred to above, which is 0.061865 henry. The self-inductance of the same coil, as calculated by formula (5), is $L = 0.06188$ henry. It is not necessary to separate the terms for L_s , as above, but it is often convenient.

Problem II.—To find the self-inductance of a coil of mean diameter $d = 50$ in. (127 cm.), wound with ten layers of cable, seventy-five turns per layer, two cables in parallel. The diameter of the cable is $w = 0.5$ in. (1.27 cm.), and the distance from center to center of cable is $p = 1$ in. (2.54 cm.). Therefore $b = 75$ in. (190.5 cm.), $c = 10$ in. (25.4 cm.), $q = 2$ and $N = 375$. As in Problem I,

$$\begin{aligned}
 L_s = & \frac{\pi^2 \times 50^2 \times 375^2}{0.3937 \times 10^9 \times 75} [1 - 0.2829 + 0.0555 - 0.0031 \\
 & + 0.0004 - 0.0001] = \frac{\pi^2 \times 50^2 \times 375^2}{0.3937 \times 10^9 \times 75} \times 0.7699.
 \end{aligned}$$

The other terms of formula (4) are

²Proceedings Physical Society of London, Vol. 27, 1915, p. 371.

$$\begin{aligned} \pi^2 \times 50^4 \times 375^2 &= 0.1333 + 0.0133 + 0.0085 \\ 0.3937 \times 10^4 \times 75 &= 0.0054 + 0.0015 + 0.0003 + 0.0001 + 0.0011 \\ \text{Therefore, } L &= \frac{\pi^2 \times 50^4 \times 375^2}{0.3937 \times 10^4 \times 75} [0.7699 - 0.1146] \\ &= 0.07700 \text{ henry.} \end{aligned}$$

The self-inductance of this coil, as calculated by formula (5) is $L = 0.07699$ henry.

INTERPOLE MILL MOTORS VERSUS NON-INTERPOLE

Severe Tests Show that Interpole Machines Will Stand Abuse Much Better than Motors of Older Type and Are Desirable with "Plugging"

BY W. R. RUNNER

Westinghouse Electric & Manufacturing Company

BY FAR the larger proportion of direct-current motors in steel mills require rapid braking, either by "plugging"—that is, reversing at full speed—or by dynamic braking. The former operation is the more severe of the two, as it will be seen that if a series or heavily compounded motor is reversed when running at high speed the armature emf. adds to the line emf. The effect of this is cumulative, the increasing current causing an increasing armature voltage, the maximum value of the latter depending on the speed and the saturation of the magnetic circuits of the motor. While the peaks are of very short duration, the armature emf. sometimes goes to nearly double normal value and the current to three or more times the full-load value. As these peaks tend to produce flashing at the brushes, tests have been made to determine the effectiveness of the interpole in eliminating the flashing. That the interpole motor is better adapted to this service than the older type of motor was very clearly shown by the results obtained.

The motors tested were all of the totally inclosed mill type, series-wound, and represent standard designs of interpole and non-interpole machines. That the motors of a given rating were very similar in speed, voltage and weight is shown in the following table. Likewise, their performance curves are very similar so that the comparison is made on an equitable basis:

	One-Hour Rating, Hp.	Speed, R.p.m.	Voltage	Weight, Lb.
Interpole	80	480	230	4,550
Non-interpole	75	500	220	4,360
Interpole	40	525	230	2,900
Non-interpole	37½	535	220	3,070

The two motors of a size were coupled together, and the one not being tested was used as a generator for load. This had the additional advantage of operating both motors with the same inertia load, an important point in tests of this type. The scheme of connections is shown in Fig. 1, except that the arrangements by which either motor could be used for test are not shown. The usual type of magnetic control was used, so that the interval the current was off between "run" and "reverse" was essentially the same as in actual practice.

The method of test was as follows: The motor *M* was started by means of the usual starting resistance (not shown) and run at normal voltage. The generator *G* was loaded with resistance *R*, its field being

separately excited. When the correct speed had been obtained by varying the load on *G*, the motor *M* was reversed by opening switches 1-3 and closing 2-4, the magnitude of the peak being determined by resistance *R*. By reducing *R*, the plugging peak was increased until a slight spit was produced at the brushes. This point of maximum allowable peak was determined at

FIG. 1—SIMPLIFIED DIAGRAM OF CONNECTIONS

a number of speeds on all motors, and the results were plotted as shown in Fig. 2.

The curves in Fig. 2 were plotted from the ammeter "kick" readings taken as described in the preceding paragraph. The ammeter used was the usual permanent magnet and moving-coil type, heavily damped. It was known that this meter would not record the actual maximum peak, so to determine the error an oscillograph was used to check the meter at several points on the curve. It was found that at the higher speeds the ammeter and oscillograph readings were rea-

FIG. 2—RELATIVE EFFECTS OF INTERPOLE AND NON-INTERPOLE MOTORS

sonably close, but at the lower speeds the ammeter readings were approximately half of the values obtained by the oscillograph. The discrepancy at the lower speeds was probably due to the extremely short time interval required to bring the motor to rest, owing to the large current used and the low speed. At the high speeds the current on "plug" was lower

and the rotative energy high, varying as the square of the speed. This meant a comparatively long time required to reverse, giving the ammeter time to swing to nearly full value. This fact made the test somewhat in favor of the non-interpole machines, as owing to lower plugging currents a longer time to stop was required. As a result the ammeter readings were nearer the actual value of the current commutated than were the readings on the interpole motor.

Referring to Fig. 2, it will be seen that the interpole motor commutated a peak load of 320 per cent normal load at 80 per cent of the full-load speed, and that increasing the speed to 200 per cent of normal decreased the maximum peak only to 270 per cent full-load current. On the other hand, while the non-interpole motor commutated 270 per cent full-load current at 80 per cent speed, it commutated only full-load current at 200 per cent speed.

In addition to the foregoing tests a cycle test was run to determine the effect of plugging on the two types of motors. The same general scheme of connections was used as shown in Fig. 1, except that all operations were controlled by a motor-operated master drum. The cycle of operation was start, run under load, and plug, this being carried out on each motor alternately. This cycle was repeated approximately

sults being very much the same in each case, showing that the interpole is extremely desirable in motors which are to withstand severe plugging service.

IMPROVING MOTOR DRIVE IN MAINE SHOE FACTORY

Individual and Group Drives Favored in Different Cases—Arrangements Employed in Repair Shop to Insure Economical Operation

ONE of the best equipped shoe factories in New England from the point of view of the motive-power engineer is the plant of Lunn & Sweet at Auburn, Me. Within two years various features of the motor service have been much improved. Energy is furnished by the Androscoggin Electric Company of Lewiston and Auburn, and the plant is operated by about 175 motors ranging in size from 0.1 hp. to 25 hp. Most of the motors are rated at 3 hp. to 10 hp., the majority being 5-hp. units or under.

An improved motor application in the stitching room is illustrated in Fig. 1. In this section eight "Peerless" fold cementers were formerly belted to a 3-hp. motor which also ran twelve sewing machines. At present four cementers are mounted on a single bench, consti-

FIGS. 1 AND 2—CEMENTER DRIVEN BY INDIVIDUAL MOTOR; CHAIN DRIVE, SNAP SWITCH AND FUSE BOX FOR ONE GROUP OF SEWING MACHINES

7500 times on each test, each cycle requiring about thirty seconds. At the end of this time it was found that the commutator of the interpole motor had acquired a good polish and showed no bad effects from being plugged at 150 per cent speed with a peak of approximately 275 per cent full load. The non-commutating-pole motor, however, did not show up so well as indicated by the curve in Fig. 2, as the commutator began to show signs of pitting, due to plugging peaks of slightly more than full load, the speed and number of cycles being the same as for the other motor. This test was conducted on several different sizes, the re-

sulting a productive unit, each machine being directly belted to a 0.1-hp., 110-volt General Electric (Fort Wayne) induction-type motor. The eight cementers require but 0.8 hp. when all are in service, and these motors are more efficiently loaded than under the previous arrangement. A separate snap switch at each operator's position controls the motor, thereby affording maximum ease of control and saving energy.

The bench units mentioned are illuminated by four 25-watt lamps per bench, as indicated in the illustration. Each lamp is mounted in a Holophane metal reflector, the latter being hung by a lamp cable which passes

through the end of a forked wooden arm hinged at the lower end to the counter. Screw eyes in the rod provide a snug attachment for the lead wire and afford sufficient flexibility to enable the arm to be turned through a considerable angle for the convenience of the machine operator. The arms are 30 in. (76.2 cm.) long and were made up at the factory at nominal cost. The

FIG. 3—OLD ARRANGEMENT OF GROUP MACHINE DRIVE

four lamp units on each bench are controlled by a single snap switch from which the units are fed by leads carried in molding, the feed from the floor to the switch being in $\frac{3}{4}$ -in. (19-mm.) iron conduit.

In the stitching room a number of sewing machines were formerly driven in large groups by motors ranging in size from 1.5 hp. to 5 hp. This service has now been subdivided so that in a typical case five sewing machines are grouped on a 1-hp., two-phase, three-wire, 440-volt induction motor. In the older arrangement, which included more machines and larger driving units, control was effected by a four-pole fused switch mounted on a slate base in a 20-in. by 24-in. by 5-in. (50-cm. by 60-cm. by 12.5-cm.) steel box which is carried on walls or posts.

Subdivision has enabled a more compact switch to be utilized, as shown in Fig. 2. The fuses are carried in the fireproof box under the table, but the motor switch is a three-pole snap-type unit of General Electric make, used largely in the latest individual textile-drive installations. Entire satisfaction has resulted from the use of these snap switches on 440-volt power circuits at this factory. The former motor arrangement was less convenient, the motors being mounted in perforated metal boxes on top of the benches, as shown in Fig. 3. Here three 2-hp., 440-volt, two-phase motors operated twenty-six Singer sewing machines, the starting switches and fuses being placed on the back of the bench in each case.

Probably a 5-hp.-motor is the most convenient size used in an ordinary shoe factory, on account of the convenience with which this size may be utilized either singly or in combination drives. Thus, a pair of such motors are belted to a line shaft from which are operated nine rotary shoe pounders. Special care in determining the proper pulley sizes enables this service to

be handled between two units, each taking half the load. The two motors in this case are two-phase, four-wire machines and are protected by one fuse in one wire of each phase, or two fuses per motor. A home-made mechanical belt guard arranged with rungs protects the operators in the plant in case a broken belt falls toward the floor, the rungs keeping the belt off the heads of the employees.

REPAIR SHOP FEATURES

In connection with the maintenance of motors at this plant, a compact repair shop is in service adjoining the stitching-room floor. The cabinet is about 10 ft. high, 7 ft. wide and 1 ft. deep (3 m. by 2.1 m. by 0.3 m.). One of the most interesting features is a fuse rack built of three pairs of slotted upright wooden bars of 1.5-in. by $\frac{3}{8}$ -in. (3.8-cm. by 0.96-cm.) stock. Each pair corresponds to a certain numbered section of the factory and carries the fuse sizes normally used on the motor circuits of that section. In case of a report of interruption the maintainer, who is informed of the factory section involved, seizes the fuses corresponding to that section without any loss of time, and upon arriving at the scene of trouble effects a replacement in minimum time. Even fifteen seconds saved in the restoration of service in a factory where intensive production is the practice counts in these days. Rapid cooling of a burned-out motor, with consequent increased speed of replacement, is accomplished by the use of a Pyrene fire extinguisher, one of which is always kept at the front of the cabinet.

To facilitate layout and maintenance work, a series of roller plans has been prepared showing the location of every machine, shaft line, column, hanger and motor in the plant. Fig. 4 shows one of these plans, drawn to a scale of $\frac{1}{8}$ in. to 1 ft. (10.4 mm.-1 m.) and kept in the office of the superintendent of buildings and maintenance, who has charge of all electrical service. Experience shows that a scale of $\frac{1}{4}$ in. per ft. (20.8 mm. 1 m.) is preferable for future work of this kind. The

FIG. 4—SCALE DRAWING OF MOTOR LAYOUT

plan shown is about 5 ft. (1.5 m.) long and saves many measurements in the field. The larger scale, however, is more convenient for all-around service.

Ernest Bragdon is the superintendent of building and maintenance in the plant described, and under his direction the motor applications have for the most part been made.

Synchronizing Stations to Reduce Interruptions

Flexibility of Operation of a 33,000-Volt System Greatly Increased by Installation of Two Synchronizing Stations That Are Some Distance Apart—Use of Electrostatic Synchroscope Reduced Investment Considerably

ENDEAVORING to reduce service interruptions to a minimum and to permit paralleling its stations and shifting loads in the shortest time possible, the Central Illinois Public Service Company of Mattoon, Ill., has installed two three-phase, 33,000-volt outlying synchronizing stations, one at Pana and another at Roodhouse. The design and construction of these installations is of particular interest because they are built primarily in the interest of better and more efficient electric service and because the use of the glow type of synchroscope permitted the engineers to effect a substantial reduction in the necessary investment. The two stations are alike in design and purpose, except that the station at Pana is a two-circuit layout, while the other at Roodhouse is a three-circuit design.

The function of the Pana station is to connect and disconnect the lines between the power house at Mattoon, 42.4 miles (68.2 km.) distant, and Kincaid, 36 miles (57.93 km.) distant. The function of the three-circuit station at Roodhouse is to permit operators to connect together in any combination the lines from the power house at Kincaid, those from the substation at Hull and those to Jerseyville. The system toward Kincaid consists of 250 miles (402.33 km.) of 33,000-volt network fed normally by two power houses. Hull is 50.6 miles (81.5 km.) from Roodhouse, but the system in that direction comprises 252 miles (405.5 km.) of 33,000-volt network, receiving energy from the Keokuk hydroelectric plant normally and from two other generating plants under abnormal conditions. The Kincaid generating plant is about 60.4 miles (90.1 km.) distant. There are four substations but no generating plants on the shorter line to Jerseyville. The relative localities of these points are shown in Fig. 1.

and then synchronize its machines with the completed line at the power house. On account of the fact that the operators and the load dispatcher had to use the long-distance telephone of the Bell system for communication in such cases, it usually required upward of twenty minutes to put the two plants in parallel. Similar difficulty was encountered if one station wanted to shift a part or all of its load to the other. Even if the company had owned its own telephone dispatching lines

FIG. 2—ONE-LINE DIAGRAM OF CIRCUITS AT THE PANA STATION

synchronizing would still have required an interruption. With these new synchronizing stations in operation, however, loads can be shifted and the plants paralleled with great flexibility.

Both of the stations are of the indoor type, not because the equipment itself demands housing, but because of other conditions that entered. At Pana it was necessary to house some mercury-arc rectifiers, so the synchronizing station was placed in the same build-

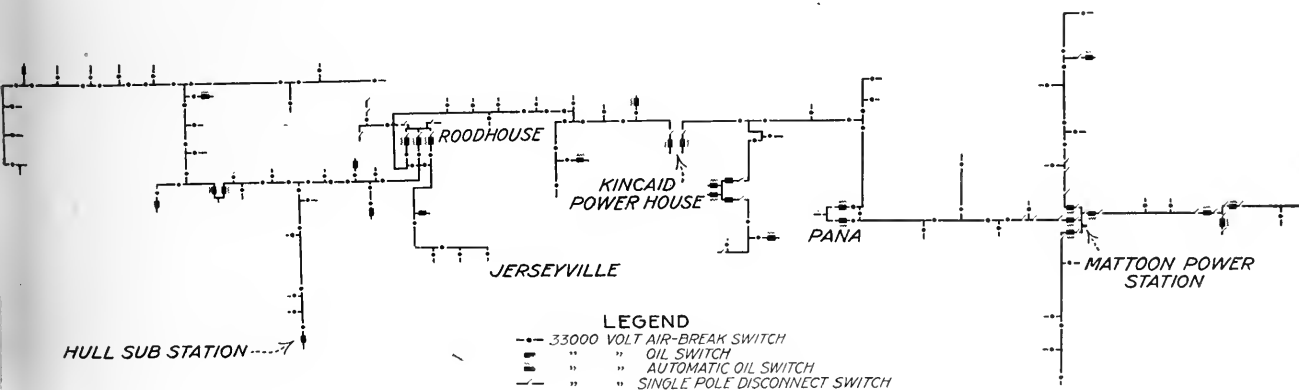

FIG. 1—TRANSMISSION SYSTEM, WITH THE LOCATIONS AT WHICH SYNCHRONIZING STATIONS ARE INSTALLED

Before these synchronizing stations were placed in service it was not customary for the Mattoon and Kincaid plants to operate in parallel. The line was usually open at Pana; consequently when the operators desired to synchronize the two lines it was necessary for one station to drop the part of its load between the two towns, permit the other station to pick up the load,

ing. At Roodhouse the equipment was placed indoors because it could occupy a building which had to be put up for an attendant.

The general layout of the Roodhouse station is shown in Fig. 3. All three lines enter through air-break tie switches. Two similar air-break tie switches were also added ahead of these switches for added

flexibility of operation. The lightning arresters are of the latest sphere-gap electrolytic 33,000-volt type. The breakers are equipped with low-voltage trips to localize trouble and to permit a generating plant to come back on the line quickly after a disturbance. Four sets of

scope as it would appear properly connected for synchronizing two circuits is shown in detail in Fig. 4. The synchronizing indicator is known as the glow type. It consists of three electrostatic glowers with special receptacles mounted in a case resembling those

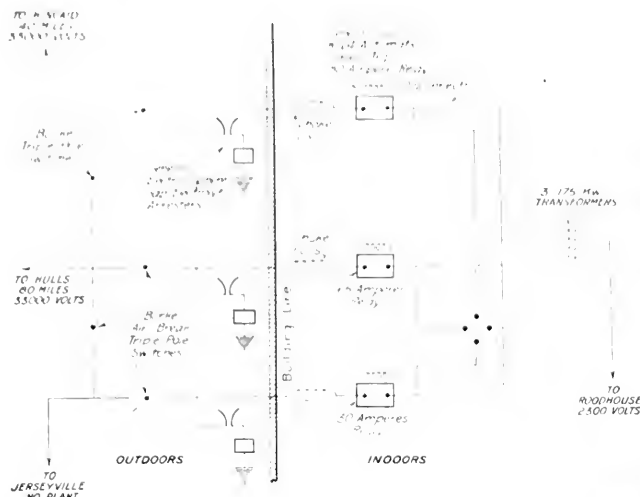

FIG. 3—ONE-LINE DIAGRAM OF CIRCUITS AT THE ROODHOUSE STATION

three single-pole disconnecting switches are installed between the oil switches and the high-tension bus for Roodhouse to permit de-energizing any part of the equipment for repairs. In fact, with the layout as it is, many combinations can be worked out to give continuous service to the three 175-kw. transformers serving Roodhouse and to all other parts of the system and yet leave a section of the station free for repairs or inspection.

It should be observed that three 175-kw., 19,100/2300-volt transformers connected Y-delta, with the neutral of the Y grounded, have been installed. The primary object of this arrangement is to better the service, but it also eliminates to some degree excessive surges and localizes trouble out on the lines more quickly. These transformers are much larger than are required to carry the 200-kw. load at Roodhouse, but the additional rating was thought advisable to take care of breakdowns out on the line which would throw a short circuit through the transformers in one leg of the Y. Therefore, in addition to carrying the load, these units will act as grounding transformers. Since the station will not be heated in the winter, the oil switches are filled with General Electric No. 19 oil. Except for the air-break switches supplied by the Railway Industrial & Engineering Company, all equipment at Roodhouse was supplied by the General Electric Company.

The leads to the electrostatic synchroscope are taken from the 33,000-volt line between the oil switches and the "disconnects." The wiring diagram for the synchro-

FIG. 4—CONNECTIONS FOR ELECTROSTATIC SYNCHRONISM INDICATOR

FIG. 5—GENERAL VIEW OF EXTERIOR OF PANA SUBSTATION

used for round-pattern switchboard instruments, two special triple-pole disconnecting switches mounted on a specially treated marble panel with 90-in. (228.6-cm.) pipe supports and braces, a standard disconnecting hook and insulators for breaking the circuit between the incoming lines and the terminals of the glowers. The device is designed for use on lines having either suspension or strain-type insulators. On lines equipped with petticoat insulators suspension-type insulators would have to be substituted at the point of connection for the synchronism indicator. In all cases one extra insulator would have to be provided for each line wire as shown in the connection on the wiring diagram. The

FIG. 6—INTERIOR OF PANA SYNCHRONIZING STATION AND SUBSTATION WITH SYNCHRONISM INDICATOR ON SMALL PANEL BETWEEN OIL-SWITCH PANELS

terminals of one of the glowers are connected to the leads of the same phase of running and incoming lines. These glowers are each connected across dissimilar phases of the remaining leads of the running and incoming lines. When the lines are not in synchronism

glowers indicate the relative frequency of the lines in the same manner as the usual synchronizing lamps. When the lines are in synchronism the rotating effect disappears, the glower connected to the corresponding line becomes dark, and the other two show about half brilliancy.

By the use of the electrostatic synchronizing device at this station and the one at Pana it was possible to eliminate investment in instrument transformers and their attendant accessories. These instrument transformers themselves cost about \$250 each. Conservatively estimated, therefore, the reduction in investment through the use of the synchroscope was more than \$500 for each station. Owing to the fact that certain materials necessary to the manufacture of these synchroscopes are not obtainable, they are at this writing temporarily withdrawn from the market.

The station at Pana is similar in its general design to that at Roodhouse, with the exception, as before mentioned, that it is a two-circuit layout instead of three-circuit. Furthermore, at Pana the use of grounding transformers is not required. The oil switches and lightning arresters in the Pana station were supplied by the Westinghouse Electric & Manufacturing Company.

PLANNING INDUSTRIAL CENTER TO TURN OUT WAR MATERIAL

Electrical Equipment to Be on a Huge Scale—Account of Housing Plans—Fifty-Million-Dollar Appropriation

Housing preparations on a gigantic scale are now being made by the United States government, which not long ago acquired a tract of land near Charleston, Va., where industrial works are to be erected covering every possible branch of manufacturing activity for the production of war material. An available appropriation of about \$50,000,000 has been made by Congress for this purpose, one of several projects of its kind, and a force of draftsmen, architects, engineers, etc., numbering at least 250 is now engaged designing mills, factories, foundries, machine shops, administrative buildings, power plants, dwellings and such other structures as may be useful in the construction, equipment and installation of a city with a population of 100,000.

The property is on the Great Kanawha River, with a water frontage of three miles (4.8 km.) and running back from about three-quarters of a mile to a mile (1.2 to 1.6 km.). in depth. The preliminary work of planning and designing the buildings, which will be of all sizes and shapes, is in charge of Graham, Anderson, Probst & White, architects and engineers, 14 Madison Avenue, New York City, who have been commissioned by Secretary McAdoo to put into execution the aims of the Shipping Board. When the ELECTRICAL WORLD called upon the firm for information respecting the electrical equipment and installation of the enterprise, it was found that stage of the work had not yet been entirely finished, although a corps of specialists had been steadily employed for a month past in making plans and estimates. Besides, numerous consultations were held with persons and firms, either professionally or for the supply of material, which may contribute to the speeding up and early com-

pletion of the vast war-time industrial undertaking.

For the central station, which will be situated about the middle of the reservation, 2300 three-phase, 60-cycle motors have been decided upon for the distribution of power. The actual motor voltage will be 440. Special electrical equipment will be manufactured for the powder mill, but the size or design has not been as yet determined; and this plan will be followed with other buildings erected for specialized products. Nevertheless, standard types of apparatus and supplies will have the preference when suitable. Construction work is under way, and the specifications for the electrical installation will be taken up and disposed of within a month, probably sooner. A great quantity of motors, with the question of horsepower still in abeyance, will be required. The lighting-plant requirements will call for thousands of tons of cables and wire, great quantities of line material, wiring devices, thousands of insulators and incandescent lamps, projecting floodlamps, conduit, fuses, switchboards, sockets, globes, bowls, shades, not to mention transformers, converters and other apparatus.

So far as could be gathered from the informant of the ELECTRICAL WORLD it is not the intention to advertise for bids but to go into the open market and place contracts for electrical material of all kinds to the best advantage and with firms that can make the best and quickest deliveries. Evidently there will be a minimum of official convention in making purchases whenever the buying starts, and all parts of the country will be called upon to supply the machinery, apparatus and accessories. Doubtless the greater portion of the large equipment will be bought direct from the best known manufacturers, with plants that can handle orders expeditiously; but in the minor supplies manufacturers, jobbers and general distributors having stocks of sufficient size to draw upon will get their share. Being given priority orders in every instance, the requisitions will receive immediate attention and prompt shipment will be given to them.

The McKenney & Waterbury Company, Boston, has been awarded a fixture contract for 100 houses at Braintree, Mass., for the War Department, and has recently received similar contracts for thirteen other public or semi-public buildings, most of which are in Massachusetts.

Electric Plants from the French Insurance Companies' Viewpoint

The insurance premiums against fire in electric plants are generally less than those imposed on other plants because of the preventive measures against fire ordinarily taken in building the former. The French insurance companies, now thinking these premiums insufficient, are endeavoring not only to raise the rates but also to limit the risks covered by the policies. A writer in the *Revue Générale de l'Electricité* holds that such limitation would multiply the contests, already too frequent, caused by provisions of this nature, inasmuch as the companies would have an interest in maintaining that fires were caused by electrical accidents not covered by the terms of the contract. He insists that the new tariff shall cover all risks without discrimination, thus simplifying the question of extra premiums and preventing litigation.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

STURDY TYPE OF BAYONET CONSTRUCTION FOR CORNERS

Method Adopted in Iowa to Eliminate Trouble Occurring from Tendency of Sky Wire to Pull Out of Line at Turns

On its 33,000-volt transmission lines the Iowa Railway & Light Company of Cedar Rapids, Iowa, has adopted the type of bayonet construction shown herewith for use at all corners. With the single-bayonet construction formerly used occasional trouble developed, and this sturdier construction was designed to remedy that condition.

GROUND WIRE IS RUN THROUGH U-BOLT CLAMPS SHOWN AT LEFT END

The outfit consists of two standard 48-in. (121.92-cm.) bayonets, three space bolts, two of which are $\frac{5}{8}$ -in. (1.58-cm.) bolts and one of which is a $\frac{1}{2}$ -in. (1.27-cm.) bolt, and two Belcher clamps. The two larger bolts are used to attach the bayonets securely to opposite sides of the pole, while the space bolt above is used to connect the two angle irons together for greater rigidity. The sky wire is run through the U's of the clamps and need not be cut to make the turn. These devices, according to John M. Drabelle, electrical engineer for the company, have proved satisfactory in service.

THE LOCATION OF SWITCHES ON DISTRIBUTION LINES

Accessibility Most Important Point to Consider in Installing Switches and Cut-Outs on High-Voltage Lines

Many companies operating high-voltage distribution lines (6600 volts to 33,000 volts) in agricultural territory make it a practice to install switches at points where branches leave the main line in order to avoid main-line shutdowns in case repairs are required on a branch. These switches may be either fused or non-fused. In addition, fuses are installed at all transformer stations. Where branches run to single transformer stations an economy will result in placing the transformer cut-outs at the point where the branch leaves the main line, thus omitting a duplication of cut-outs at the transformer.

Not only is a saving effected in the installation cost, but maintenance is made easier, since main lines ordinarily run along rural roads while transformer stations are located in adjacent fields. Fuses at branch points

are therefore more readily accessible than at transformer stations.

The accessibility of switches is one of the most important points to consider in their installation. A switch not readily available in all weathers is highly undesirable since it may prove inoperative when most needed. On a Western 11,000-volt distribution network a tie line *T* was run to connect to a main line *M* which was in itself a tie between two substations.

FIG. 1—DIFFICULTY OF SECTIONALIZING LINE AT LEFT AVOIDED BY CHANGING TO ARRANGEMENT AT RIGHT

(Fig. 1). Naturally three air-break line switches were installed to give maximum flexibility.

Investigation of the point of intersection of the two lines demonstrated the fact that a marsh under water in winter intervened between the switch location and the nearest road, one-half mile (8 km.) away. It was therefore decided to loop the main line in the manner shown, placing two of the switches on the adjacent pole on one side of the road and the third on the nearest pole on the other. It is believed that this

FIG. 2—SPECIAL SWITCH POLES PLACED ON EACH SIDE OF ROAD SHOWN IN FIG. 1

extra half mile of line to make the switches available at all times is a well-justified investment.

In another case location of the three switches at an intersection point at the first pole beyond the intersection in each direction would have placed two of the switches in orchards beyond fences. A special switch pole was installed, and all three switches were mounted on this pole with the operating handles accessible.

Operating handles which may be reached from the ground are great time savers in emergencies and are to be recommended, provided that the handle may be padlocked in either the open or closed position. One Western company which has on its lines several hundred of this type of switch both at transformer stations and branch-line points reports no case in which unauthorized individuals attempted to tamper with a switch. Switch handles should be uniformly installed to be closed when in the up position. A variation in this arrangement which is possible in some types of switches so that the handle is in the up position with the switch open might lead to accidents when switches are operated at night.

Accessibility of switches on distribution lines which are ordinarily not paralleled by company telephone circuits also implies proper location with reference to telephones, particularly those which may be reached at all hours. Often a careful choice of switch locations will save many valuable minutes in the average time taken by a patrolman to reach a switch, open it and report back to headquarters.

PREVENTING EXPLOSIONS IN BOILER FURNACES

Necessity of Special Consideration When Using Low-Grade Fuel—Apparent Causes and Methods of Prevention

BY GILBERT RUTHERFORD

On page 100 in the Jan. 12 issue of the *ELECTRICAL WORLD* the causes and prevention of explosions in boiler furnaces were discussed, attention being directed to the necessity of increased caution because of the present-day use of low-grade fuels. Additional information is given here on this subject:

The banked fire may constitute a danger in several ways, a danger that can be largely removed by remembering that it is possible and taking the simple precautions which follow. The cause is evidently that virtually all air supply to a banked fire is shut off so that the distilled gases do not have an opportunity to burn. As a result, if the proper quantity of air is accidentally admitted a violent explosion is liable to occur. To prevent the dangers of an explosion from this cause it is important to shut the furnace and ash-pit dampers sufficiently to prevent air passing through the fuel bed any faster than is required to keep the fire alive; close the flue damper as much as possible without impeding the escape of the gases distilled by the banked fire and allow air to enter the furnace above the fuel bed. By maintaining air circulation above the fuel bed and through the flue damper stagnant explosive mixtures if formed are able to escape. To prevent explosions occurring when opening the bank preparatory to bringing the fire back to active operation the flue damper should be opened some time before closing the air inlet over the fire. Then, after the combustible gases have had accelerated circulation, it is safe to open the fire dampers, and later the firedoor, to start up the fire again.

The crux of the matter of furnace explosions is the control of the air. The air required for complete combustion, which means highest combustion efficiencies, is different from that required for explosion. Maintenance of approximately equal pressures outside and in-

side of the furnace, which is accomplished easily where the balanced-draft system of automatic control is employed, tends to accomplish this automatically. However, care should always be exercised to safeguard the furnace and the firemen, and the need for this is greater where coal dust and coals of small particles are used.

INEXPENSIVE REMOTE-CONTROL SWITCH FOR STREET LIGHTING

Details of Construction, Operation and Installation
Given—Switch Is Used on Multiple Electrolier
Lighting and Signs

An inexpensive remote-control switch, series-operated by a pilot circuit, which will be found useful, particularly in controlling multiple electrolier lighting and signs in small communities, may be constructed of a wall-type pull switch in conjunction with a series coil from an old inclosed carbon arc. At present such coils may be purchased for a nominal sum, as many arcs are being superseded by higher efficiency units. The coils and switch are mounted on a wooden base, $4\frac{1}{2}$ in. by 8 in. (11.4 cm. by 20.3 cm.), with the coils uppermost. Leads are brought out to suitable binding posts. The solenoid is attached to the operating cord of the switch by means of a piece of tape which also serves as a buffer between switch case and solenoid.

SWITCH FOR LIGHT-
ING CIRCUITS

It will be found that a momentary direct current of 7 amp. to 10 amp. will be sufficient to operate the switch with a quick, positive motion.

The exact direct-current voltage required to be impressed on the circuit to produce this operating impulse will, of course, depend on the number of solenoids in series, their resistances and the characteristics of the connecting series circuit. Ordinarily, a dozen or more switches can be operated from a 125-volt direct-current exciter circuit, and if a 500-volt railway circuit is available a large group can be operated. A field discharge switch is to be preferred for throwing in the circuit.

By the use of two-circuit and three-circuit electrolier switches various combinations of midnight and all-night lights may be switched from the same circuit. In case such switches are used a pilot switch with lamps should be mounted at the operating switch to indicate the position of the switches in the field.

Since the operating current is only momentary, losses in the series circuit may be neglected and a choice of conductor may be made entirely on a basis of mechanical strength, except that the resistance of the series circuit will, of course, limit the total number of switches which may be operated from the available direct-current source.

POWER REQUIREMENTS OF MACHINES IN LARGE SHOPS

Besides Giving Power Requirements, Table Gives Information on the Grouping of Machines and Horsepower of Motors Used

In the accompanying table are given the power requirements and best grouping of machines in a large machine shop that was recently laid out. The shop is

divided into fifteen groups, the table giving a description of the driven machines as well as the horsepower of the motor required to drive the apparatus. This table should prove of value to engineers grouping machines for motor drive. The machines have been so arranged that for most jobs raw materials will enter the rear of the shop and pass from group to group, leaving the last group as a finished product.

METHOD OF WEIGHING

BOILER-FEED WATER

Water Is Weighed in Barrels so Arranged as Automatically to Fill, Ring a Bell When Full and Then Empty

BY T. W. REYNOLDS

Such refinements as duplex-piston meters or Venturi meters, which are generally used in large power plants, are not absolutely necessary for accurately measuring boiler feed. An accurate method is to weigh the water in barrels by the method given here. The apparatus shown is devoid of complications, automatically indicating the filling of each barrel by means of an electrical alarm. A float in a barrel with a piston rising closes a circuit and rings the bell. The piston rises

EQUIPMENT ARRANGED FOR TESTING WATER FOR LARGE BOILERS

through a 2-in. (5.08-cm.) pipe, the latter serving as a vent to relieve excess pressure tending to burst the barrels.

The weight of water for a filled barrel is predetermined, and the number of fillings are noted as indicated by the bell. When the barrel is filled the intake valve is closed and the outlet valve opened. When empty the process is repeated as often as may be necessary. Two sets of barrels are necessary for testing large boilers. For small boilers only barrel B is required, the tees being plugged at C and D. With both barrels in use, the incoming water is divided equally to each through Y fittings, and entrance must be made on the side opposite the outlet so as not to disturb the float.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

COME OF 50 PER CENT

ON LINE EXTENSION

**Pacific Coast Company's Reasons for Requiring a
Revenue of This Size Before Starting Con-
struction Operations**

The Pacific Power & Light Company, Portland, Ore., in building a line extension, requires an estimated annual revenue from the installation of 50 per cent of the cost of the line. The company arrived at this figure by referring to a report of the Public Service Commission of Washington on the valuation, earnings, etc., of a company made in 1914 and 1915.

The report referred to shows that of every dollar the company has invested 48.7 per cent is in power plants, 8 in transmission lines, 5.8 in substations and 28.2 in distribution lines. Besides, the report shows that for every dollar invested gross earnings amounted to 14 cents and net earnings to 6.5 cents. In other words, the net earnings were 6.5 per cent on the investment. With these figures then in mind, the company reasons as follows: Assuming 6.5 per cent as a reasonable rate of return, gross earnings of 14 cents must be had on every dollar of total investment, of which 28.2 cents are in transmission lines. Conversely, then, with every 28.2 cents in transmission lines, gross earnings amount to 14 cents. Therefore, for every dollar in transmission lines gross earnings must amount to 49.6 cents. Therefore, an income of 50 cents on every dollar invested in distribution lines must be demanded. It has been further pointed out by the company that these figures make allowance for depreciation.

THE SALES DEPARTMENT'S

RELATIONS WITH CUSTOMER

**How the Activities of Commercial Men Connected
with Central Stations May Be Made More
Helpful in War Time**

Speaking before the American Institute of Electrical Engineers, Chicago Section, Jan. 14, F. A. Coffin, superintendent of power sales for the Milwaukee Electric Railway & Light Company, delivered some particularly pertinent remarks concerning those aspects of economy conservation which affect the sales departments of central stations. Mr. Coffin said:

An important condition facing all of us is the growing difficulty in financing extensions to meet new customers. We are rapidly approaching a condition where only such capital expenditures are justified as are directly necessary to the prosecution of the war. It is probable that, in addition to the deterring influence of the high cost of obtaining new money, we shall have regulatory action by federal authorities. All of this vitally affects expenditures for line service extensions which have hitherto been an inseparable part of the progress of attacking new business. There has been the same radical revision of the rule with respect to extensions, and it is the case that during these times customers will be required to finance at least the dif-

ference between normal cost and present abnormal costs in supplying them service.

The second aspect of importance is economy in the conduct of the sales department. I do not share in the pessimistic viewpoint that the war leads to a curtailment of the use of electric service. Early this year our company dispensed with all but the nucleus of its sales organization, and it is of interest to note that the increased business which we hope to receive by the end of the year through the usual sales methods has all come to us unsolicited. The high cost of fuel has no doubt made many industrial enterprises more ready to inquire for electric power supply, and a part of the business gained has been secured through the momentum of the past sales efforts; but, even discounting the effect of the fuel shortage, there is still a normal increase in the demand for service.

The third aspect to which I desire to direct attention is the question of character of service. The user of electric energy in America receives more in auxiliary service rendered by the engineering department, the trouble department, the lamp-renewal department, etc., for the rates he pays than the customer in any other country. We have naturally taken great pride in the completeness of the service we furnish, but there is no gainsaying that it imposes a very substantial expense, which is probably not justified in these times. The food administrators are now recommending an extra charge for delivery of parcels from other mercantile institutions, and there is no reason why similar modifications should not be made in our rules with respect to delivery of lamps, appliances, etc., or why the amount of gratuitous assistance given by engineering departments should not be gaged by the necessities of the situation, rather than by a mere endeavor to accommodate the customer.

Finally, and by no means the least important, the duty of the sales department lies in co-operation with the fuel conservation program of the government. Lightless nights perform an admirable function in impressing upon all customers the necessity of conservation, and no doubt the sum total of little economies effected will help the nation save coal; but we should be deceiving ourselves as well as the public if we lost sight of the fact that the actual amount of fuel in the power house saved by this method is indeed very small, being a mere fraction of 1 per cent of the total coal consumed by the central station and an infinitesimal part of the coal used by the entire community. There is much to be done besides enforcing and thoroughly co-operating with the rule with respect to lightless nights. Perhaps the most important economy which can be achieved would be the organization by the Fuel Administrator of a voluntary inspection service for industrial plants charged with making definite practical recommendations on the proper installation of steam-pipe coverings, satisfactory maintenance of boiler settings to avoid air leaks, scale elimination in boilers, care in banking and firing boilers, avoidance of general illumination of unoccupied factory space, possible savings effected by shutting down machinery when not required, etc., and the general elimination wherever possible of the non-condensing plant. In such a work the commercial engineering department would do effective work. It is not necessary for me to point out that such a system by the central station is a labor in the interest of patriotism.

We are naturally not interested in laboring to make the isolated plant more efficient. Our interest in normal times is to shut it down and to sell it service, but the necessities for fuel conservation are so great and pressing and the possibilities in this field are so substantial that no effort should be spared to co-operate to the greatest extent possible.

EXAMPLE OF CO-OPERATIVE READJUSTMENT OF LOADS

Power Customers Come to Central Station's Assistance, Thereby Reducing System Peak and Insuring Full Energy Supply to All

An instance of patriotic co-operation between a central station and its power customers recently came to light in connection with a service investigation bearing upon the coal shortage. The central station in this case purchased the bulk of its energy from a hydroelectric power company, and was asked by the management of the latter to cut out 20,000 kw.-hr. a week of its input from the water-power system. Further to conserve the energy supply it was requested that each Tuesday a "powerless day" be observed, during which no energy would be taken from the water-power company's lines. The central-station manager in this case was exceedingly loath to shut off energy from any of its customers. His system, though a small one, extended through a dozen municipalities, and it was seen that to cut off the supply would be a great hardship locally. Conferences were held with various power users, and one of these agreed to start up a 250-kw. steam plant and run it twenty-four hours a day, feeding energy into the central-station system as required, in addition to the demand of the machine owner. Eight other power customers voluntarily agreed to cut off their service at 4 p. m. Tuesdays, resuming work at 7 p. m. the same day and running as far into the evening as necessary to make up the deficiency in output. By this arrangement the hydroelectric company was relieved of the 20,000 kw.-hr. above mentioned each week and the peak load on the system was reduced, to the great advantage of the general water-supply situation in the territory, all customers continuing to receive full total weekly service.

LIMITATIONS PLACED UPON FREE SERVICES

Gratuitous Repairs and Deliveries Now Being Curtailed as a War-Time Practice by Commonwealth Edison Company

In speaking of the war-time practice of the Commonwealth Edison Company in regard to gratuitous service before a recent meeting of the A. I. E. E., D. W. Roper, superintendent of the street department of the company, said:

In the most prosperous times if there was any trouble with a customer's lamps or motors the company would, on request, send its troubleman to the customer's premises. If the interruption to the lamps was caused by some minor defect in the wiring or in the appliances, or the sockets of plugs or switches, the repair man would, if he could do it in half an hour or so, make the repairs sometimes temporarily, but he would make the repairs so as to enable the customer to get service. He would then advise the customer what to do in the way of making permanent repairs. Nowadays the company makes a minimum charge of 35 cents for sending a repair man to the customer's premises. If the trouble is found on the customer's premises and does not have to do with the company's part of the system, the charge is considered valid. In addition, a further charge is made for any time over the first fifteen minutes which the man spends on the customer's premises. This practice applies also to heating-device calls in apartment buildings.

There formerly was a sort of a perpetual guarantee on cords for electric flatirons. The practice now is to charge

the customer for the cost of the repair. The charge, 75 cents for replacing an electric-iron cord. This applies also to other heating devices.

Incandescent lamps for a number of years have been delivered free. The company's rates, of course, require that the lamps shall be furnished free, but they do not require that they shall be delivered. It is probable that within the next few weeks the company will make a charge for the delivery of lamps similar to the charge now made in answering a trouble call. It will, of course, be possible, even under the new arrangement, for the customer to get the lamps free by applying for them at one of the numerous delivery stations in the various parts of the city.

A BONUS AND PENALTY SYSTEM FOR SALESMEN

Profits from Fixture Campaign Contribute Material to Support of Sales Department, Besides Stimulating Lighting Business

On March 1, 1917, the new-business departments of the subsidiaries of the Cities Service Company inaugurated a campaign for additional commercial and factory lighting, as stated in the ELECTRICAL WORLD of Feb. 2. The number of fixtures sold as a result of the campaign in the communities served by nine subsidiaries was 5600, with a merchandising value of \$89,600.

This business has been taken entirely from existing customers, so that no new services were required and the installation expense was held to the minimum.

The salesmen worked on a commission basis with a system of penalties and bonuses under which they received a profit on the sale of fixtures and on the increased consumption from the customer and were penalized for any business taken without increasing wattage. These commissions were figured as follows: 10 cents per fixture for 75-watt fixtures, 40 cents per fixture for 100-watt fixtures, 50 cents per fixture for 200-watt and 300-watt fixtures, 65 cents per fixture for 500-watt fixtures or larger. In addition to this a bonus was paid of 50 cents per 100-watt increase in load added without any installation. In any case, however, where the salesman sold new units without increasing consumption he was penalized by not receiving any commission whatever on the sale of the fixture.

The profits secured from this campaign have contributed materially to the support of the sales departments in these properties.

FLATIRONS LOANED TO CONSERVE COAL SUPPLY

Pittsfield (Mass.) Central-Station Company Makes Non-Obligatory Proposition to Customers to Extend Over Six-Month Period

The Pittsfield (Mass.) Electric Company, in an effort to help conserve the coal supply, has made a proposition to its customers to loan them until July 15, without charge, electric flatirons which they may use as they see fit, without any obligation. The flatiron offered is one of the latest General Electric models, retailing at \$5. The offer states that if at the expiration of the time of the loan the customer wishes to keep the iron the company will sell it to him for \$4, payable either in cash or on monthly payments of 50 cents each month until it is paid for. To each customer a return postcard has been sent with the announcement.

HAT IS LEFT FOR THE CENTRAL-STATION SALESMAN? **portunity Which Present Conditions Offer for Actively Developing Appliance Load Can Be Made of Great Importance**

BY H. V. COFFY

H. M. Byllesby & Company, Chicago, Ill.

The central-station industry, among others, is finding existence difficult and somewhat uncertain. Of course, earnings show up well, but the operating costs are little net profit. An increase in rates is one thing the industry must have if it is to continue good service to its customers and meet legitimate obligations to employed capital.

Some companies have been successful in securing the right to make a war surcharge, and many more will secure some similar form of rate relief for the period of the war. Rates are only one of the central station's problems. The difficulty of securing capital on reasonable terms is another.

There has been some talk of the government giving electricity-producing concerns certain priority rights in demand for new capital. Unless something of this sort is done the central station is going to be overwhelmed with proffered new power business and absolutely powerless to serve it. Even if the government does provide a means for these vital industries to secure the necessary capital to build extensions and furnish equipment for the growing demands of war necessities, the cost of material, supplies and labor and the difficulty of obtaining them make it problematical whether the condition can be successfully encountered before the end of the war.

While there are many other problems, the two mentioned are enough for the central-station salesman. It means he can no longer seek new light and power business as he has been accustomed to—it means he must wait after business from an entirely new angle or get into some other department of the business.

He may not be permitted to seek new power business actively which is to be served from an extension, because the extension requires capital, and capital is not to be had. Or, if he is fortunate enough to be employed by a company which is still able to make reasonable extensions, he may have to use the utmost care and discrimination in selecting his "prospects," with the certain knowledge that it is only a matter of time until he must abandon even these efforts. Many companies do not permit the salesman to take on new power business from present customers if it comes on or near peak, because the capacity of the station is overloaded.

While the central-station salesman faces a serious problem, he also faces a big opportunity—domestic electrical appliances.

For years there has been talk of the domestic appliance load filling up the valleys. It has been thought at some time in the future the electric appliance load might represent one of the central station's greatest assets. Manufacturers have preached it and advertised it. Central-station companies and central-station salesmen have believed it, but they have conducted their advertising and their campaigns for the most part in a hasty and spasmodic way and have fallen far short of the real possibilities.

Undoubtedly the past year has seen the greatest progress in the development of the uses of electrical appliances of all the years in the history of the industry. This year will see even greater progress, particularly if the central stations get busy and do just a reasonable amount of promotion and sales work.

It is believed that every city in the United States has felt this growth during 1917. There is one city, for example, with a population of 75,000, the electrical dealers of which sold more than 3700 electrical appliances during the first ten months of the year—nearly 100 a week. No special efforts have been made to build up the electrical appliance business in this territory; it is simply natural growth as the result of the housewives recognizing their needs and satisfying them. What would have been the total if really serious efforts had been made to build up this class of business? This particular community has always been a good appliance territory, but it is safe to say that never before in a like period have anywhere near so many appliances been sold. It is doubtful even now if there are more than half a dozen houses in the city which have anything like a full equipment of electric household time and labor savers, and there are probably thousands of homes in this community which do not possess more than one electrical appliance.

Every house on the lines of a central station is a prospect for this kind of business. If the family have an electric flatiron, the company should try to sell them a vacuum cleaner. If they have both of these, sell them a washing machine. If they have this, get out the sewing-machine motor. If in each instance the real time and labor savers are sold, the other electrical conveniences will come naturally, without much sales effort. Every electrical appliance sold at a home makes it just that much easier to sell another one—assuming, of course, that the purchaser gets real service after the purchase is made.

Many central stations in the past have offered time payments on all electrical appliances. All of them ought to do this. Now particularly, when anything which costs more than \$5 can be purchased on time, special easy terms on electrical appliances are imperative and should be given to the public continuously.

ECONOMIES IN METER READING AND DELIVERY OF ACCOUNTS

Middle Western Company Materially Reduces Regular Force by Means of Employment of High School Students

The employment of high-school students in addition to the necessary regular force to read meters and distribute bills to customers has been practiced for several months past by the Sandusky (Ohio) Gas & Electric Company. This system, the company states, is not only materially reducing the expense of reading meters and distributing bills, but in addition makes it possible to reduce the regular operating force to a minimum, as it has been found that where all meters are read between the twentieth of one month and the first of the next it is not always possible to keep the entire force busy during the period from the first to the twentieth of the month, when no outside construction work is under way during the winter months.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Insurance of Electrical Machinery.—C. STUART BUYERS.—Attention is called to the dependence of industrial output on the reliable operation of the motors used. It is suggested that more plants, not having the services of expert electricians or engineers, insure their motors and take advantage of insurance-company inspectors' advice to determine when motors need attention.—*London Electrical Review*, Dec. 28, 1917.

Alternating-Current Automatic Starters for Squirrel-Cage Induction Motors.—W. H. PATTERSON.—An explanation of the operation of an automatic alternating-current starter for squirrel-cage-type induction motors. Some of its applications and limitations are pointed out.—*Power*, Feb. 5, 1918.

Lamps and Lighting

Portable Magneto Lamps in the Teutonic Armies.—A description of several types of such lamps found in ground recovered from the enemy. They are operated by springs actuated by the hand and have obvious advantages over the non-enduring storage-battery pocket lamp. The drawback of weight, however, makes it little likely that they will supersede the other type. The most powerful of the magneto lamps, which has a reserve of energy affording ten minutes' lighting with no movement of the hand, weighs about 1580 grammes, or 3.3 lb.—*L'Industrie Electrique*, Nov. 25, 1917.

Arc Lamps with Two Pairs of Carbons for Networks with Polyphase Currents of Low Frequency.—ANDRÉ BLONDEL.—Description of a very simple arrangement for suppressing the difficulties that result from the employment of many polyphase arcs.—*Revue Générale de l'Electricité*, Dec. 22, 1917.

Electric Lamps in Non-Gaseous Mines.—GEORGE H. DEIKE.—According to the author, fussing with oil and carbide lamps consumes thirty to fifty-five minutes per shift and reduces the loader's output 35 per cent. Insurance earnings on electric lamps will pay about 18 per cent on the money invested in them. Electric lamps cost roughly a half less to maintain than oil or carbide lamps.—*Coal Age*, Feb. 2, 1918.

Generation, Transmission and Distribution

Some Developments in the Electrical Industry During 1917.—JOHN LISTON.—A review of the activities of the electrical industry during the past year. There are, however, many important developments associated with war work that cannot be mentioned for obvious reasons.—*General Electric Review*, January, 1918.

Mechanical Features of Transmission Lines.—A. GRONDA.—The author discusses latticed posts critically, showing they are not always the most economical, and that tubular construction is sometimes preferable; he considers the reactions between conductors and posts, and gives a chart for the calculation of the ten-

sion of aerial lines, showing how to employ it to determine the strain put upon the posts when they are unsymmetrically loaded.—*L'Elettrotecnica*, Dec. 15, 1917.

A South American Power House.—Description of the new central station at Tocopilla, Chile, built for the Chile Exploration Company, one of the largest copper mining concerns in the world. This power house is 3000 m. (approximately 2 miles) above sea level and serves a 110,000-volt transmission line, the highest tension in operation in South America. Its capacity is 60,000 hp., with room for future growth, four Zoel steam turbines rated at 15,000 hp. each having been installed. Each turbine is directly coupled to a Siemens-Schuckert 10,000-kva., 5000-volt, 50-cycle, 150 r.p.m. turbo-alternator.—*Boletín de la Asociación Electro-Técnicos* (Buenos Aires), October and November, 1917.

Central Stations and Fuel Economy.—E. LEHOUX.—The author maintains that, without affecting their output, many central stations can reduce their consumption of coal by from 10 to 15 per cent by the application of scientific principles to the construction and operation of mechanical and electrical equipment. These principles are based on the transformation of calorific energy into electrical energy at the lowest cost, whether the transformation is wrought by means of gas engines or by steam engines or turbines. Gas engines are economical only in central stations having a high and constant load factor or where surplus production can be utilized for storage batteries. Steam-operated power houses fall into two classes, those supplementing hydroelectric installations and those operating alone or in connection with other steam stations. The first class, operating intermittently and with a variable load, consumes coal at a much greater proportionate rate than the second class, and it is in them that the best opportunities for economy occur. In plants built from 1900 to 1908, with modern equipment and generating units rated at from 1000 kw. to 1500 kw., a kilowatt-hour was produced for every 15,000 calories, or for 2 kg. (4.4 lb.) of coal having a calorific power of 7500 calories per kilogram. Since then in very high-powered plants, with turbine units rated at from 10,000 kw. to 20,000 kw., the record has been reduced to 8000 calories for a kilowatt-hour; that is to 1.07 kg. (2.35 lb.). The author inquires how much nearer the theoretical value 1 kw.-hr. = 3 calories, or 0.115 kg. (0.253 lb.) of coal, it is possible to come. His estimate of 10 or 15 per cent improvement is based on a detailed study of the entire cycle of transformation. To bring it about he would install a complete outfit of meters and registers for every step in the process of creating heat and converting it into electric energy, electrifying these instruments and bringing those for each boiler together upon a board in a convenient position where they would be under the constant supervision of an experienced operator. In addition, equalization of central-station load and

improvement of the load factor of the network of distribution are of great importance. Finally, constructors should bend their energies to the perfection of the gasogen, as a means of ameliorating furnace output, and to the study of the still experimental gas turbine. —*Revue Générale de l'Electricité*, Dec. 15, 1917.

Peat and the Electric Industry.—PIERRE GUIEU.—Continuation of an article dealing with the various ways in which peat may be employed as a main or auxiliary fuel in central stations.—*Revue Générale de l'Electricité*, Dec. 22, 1917.

Installations, Systems and Appliances

Conveyors and Elevators.—W. H. ATHERTON.—Sufficient coal storage is a vital matter for the power station, and introduces problems that are conveniently solved by conveyors. The various types of conveyors and elevators for coal handling and ash handling are considered in some detail, and reference is also made to the suction method of removing ashes.—*London Electrician*, Dec. 21, 1917.

First Electric Steel-Melting Furnace in South Africa.—The shortage of many materials is affecting the mining companies in various ways and in some instances leading to new applications of electric power. For example, a recent issue of the *Journal of Transactions* of the South African Institute of Electrical Engineers contains a paper by W. Buchanan and G. H. Stanley describing what is stated to be the first electric steel-melting furnace in South Africa. This furnace was rendered necessary by the great demands of the mining industry for stamp battery shoes and dies, which can be met with difficulty owing to import restrictions. A regular supply of material amounting to about 7500 tons per annum is required, and arrangements are now being made to utilize by means of a new electric furnace existing accumulations of scrap shoes and dies. The furnace was started on Sept. 3, 1917, the output estimated at being about 60 tons of cast shoes and dies per month.—*London Electrician*, Jan. 11, 1918.

Largest High-Head Francis Turbine.—ARNOLD FAU.—This article describes the hydroelectric equipment installed in the White River plant of the Puget Sound Traction, Light & Power Company, near Sumner, Wash. This plant contains two 18,000-hp. Francis turbines operating under a net head of 440 ft. (134.1 m.) which have developed over 44,000 hp. without any detriment to their efficiency. On account of the hydraulic conditions special engineering problems were involved, which have been solved by special features in design. A new 25,000-hp. unit is being installed, this being the largest hydraulic turbine of its type in the world.—*Power*, Feb. 5, 1918.

Electrophysics and Magnetism

Portable Roentgen-Ray Generating Outfit.—W. D. POLIDGE AND C. N. MOORE.—This article is descriptive of the development of a complete portable Roentgen-ray generating outfit for military service in the field. The essential features of the unit are its simplicity, compactness, portability and unusually high efficiency. Twenty per cent of the generated energy is utilized in the generation of Roentgen rays. The tube has been specially developed for use in this outfit and is fully explained.—*General Electric Review*, January, 1918.

Fluorometric Apparatus for Regulating X-Rays.—H. GUILLEMINOT.—Apparatus for measuring the intensity of the incidental radiation is described.—*Revue Générale de l'Electricité*, Dec. 22, 1917 (abstracted from *Comptes Rendus des Séances de l'Académie des Sciences*, Nov. 19, 1917).

Electrolytic Precipitation of Gold, Silver and Copper.—Because of the uncertain supply of metals, particularly zinc, which is now used exclusively for precipitation in the cyanide process, it is interesting to examine electrolytic precipitation, which affords the most convenient substitute. Results obtained by this method in the laboratory have been satisfactory, but industrially success has not been great in the past. This article deals with experiments made at South African and Mexican mines with improved apparatus. In a treatment with limestone extending over two months, where 4 tons of solution was used for each ton of limestone, the cyanide apparently regenerated was 0.45 kg. (0.99 lb.) per ton of limestone, while 80 per cent of gold and 89.6 per cent of silver were precipitated. The regeneration of cyanide was greater by this method because of the large quantity of copper contained in the limestone.—*L'Industrie Electrique*, Dec. 10, 1917.

Units, Measurements and Instruments

Relations Between the Electrical Units and the Laws Underlying the Units.—This digest develops in a consecutive manner the relations between the units of an "ampere, ohm, ampere-turn, weber" system of units from which all decimal conversion factors and irrational 4π factors have been eliminated. The electrostatically defined unit charge—the coulomb—is taken as the starting point. It is advocated that beginning students be taught to carry on their calculations in a single system of units and not in a mixture of three systems, and that the system taught be the pure practical system, or ampere-ohm-volt system. Furthermore, it is contended that students should not be burdened with the relations between the electrostatic, electromagnetic, the Heaviside and the hybrid practical systems until after they have learned to think in terms of a simple factor-free system. The advantages of such a course and the manner in which the relations between the units may be rationalized and freed of the troublesome conversion factors are set forth in the preface and in the following sections of the bulletin.—*Bulletin No. 880 of the University of Wisconsin*.

Measurement of Air and Gases by the Pitot Tube.—A. H. ANDERSON.—In this article is given an explanation of the use of the Pitot tube and tables to simplify calculations.—*Power Plant Engineering*, Feb. 1, 1918.

Miscellaneous

Mica.—JAMES SCOTT.—An article descriptive of its microscopical structure and behavior.—*London Electrical Times*, Dec. 27, 1917.

Deterioration of Muntz Metal (60:40 Brass) by Selective Corrosion.—The paper reports the study of selective corrosion of Muntz metal, a material having a variety of industrial uses. The selective corrosion is illustrated by four types, including tubings, sheets and forgings. The metal becomes red in color, very weak and brittle by this type of corrosion. The condition favorable to such corrosion is the accelerating effect of

the closely adhering deposits of chloride resulting from the attack of the metal. Other conditions accelerate the corrosion, as contact with the more electronegative constituents, increase of temperature and service stresses.—*Bureau of Standards, Technologic Paper No. 103.*

Condensers with 70-Ft. Water-Level Variation.—F. R. BROSIUS.—A description of the substructure adopted to assure a satisfactory supply of condensing water under unfavorable conditions and to support the great weight of the power plant and equipment on unstable ground at the West End power station of the Union Gas & Electric Company of Cincinnati, Ohio. The condenser wells are five in number. The intake well is 86 ft. (26.2 m.) deep and 60 ft. (18.3 m.) in diameter. Two condenser wells will contain all recondensing equipment; each is 84 ft. (25.6 m.) deep and 86 ft. (26.2 m.) in diameter. The two discharge wells are 17 ft. (5.2 m.) in diameter. These wells are necessarily deep owing to the fluctuating water in the Ohio River, which is about 70 ft. (21.3 m.) between the extreme low-water and extreme high-water levels. The method used for sinking the larger wells is given in detail.—*Power*, Jan. 29, 1918.

Electroculture.—A description of the electrical apparatus employed to stimulate agricultural production. Experiments have shown an increased growth under this treatment as follows: Young strawberry plants, 80 per cent; old strawberry plants, 25 to 36 per cent; potatoes, 20 to 50 per cent (in the size, not the number of the potatoes); carrots, beets and tomatoes, 20 to 50 per cent. Not the least advantage noticed is the destruction of worms and insects that prey upon the plants.—*L'Industrie Electrique*, Dec. 25, 1917.

A Talk to Firemen on Saving Coal.—CHARLES H. BROMLEY.—This is a simple, straight-from-the-shoulder talk to firemen, giving the most important things to do to get the most out of coal, with the hope that firemen and their employers will become interested enough to study fuel economy further as the problem confronts them. The author deals in the main with the following sub-topics: "Employers Need Education," "Hints on the Care of Fires," "Cleaning the Fires," "A Few Hints on the Stokers" and "Some General Hints."—*Power*, Jan. 29, 1918.

Coal and Its Selection.—WALTER N. POLAKOV.—This article includes a description of coal formation and qualities, proper selection and economical use.—*Power Plant Engineering*, Feb. 1, 1918.

Determination of Atomic Weights by Means of X-Rays.—C. W. KANOLT.—From the spectra obtained by exposing crystals of two different substances to X-rays of the same wave-length, the ratio of the distances between adjacent layers of atoms in the two substances can be easily determined, as is well known. If the relative distances are determined in the direction of each crystal axis, these results, together with the inclination of the axes to each other in each crystal, enable one to calculate the ratio of the volumes of the elementary parallelopipeds of each crystal. From this ratio and the ratio of the densities the ratio of the molecular weights can be easily calculated. From the ratios of molecular weights atomic weights can be calculated in the usual manner. After suitable apparatus has once been set up this method should permit the determina-

tion of the atomic weights of a considerable number of elements with less consumption of time and in most cases with greater accuracy than the chemical methods that have been used hitherto.—*Science*, Feb. 1, 1918.

Book Reviews

EVERYMAN'S CHEMISTRY. By Ellwood Hendrick. New York: Harper & Brothers. 374 pages.

Intensified interest in the chemical field caused by the war makes this book timely and useful. It is a real "chemistry book," giving in popular language a view of modern progress in that field, and is designed for those who know nothing about chemistry. The book tells how chemists think and how their work enters into life and industry on every hand. Valuable technical information has been presented in an interesting, readable form, which was the author's aim. This is the second book of a modern science series planned by Harper & Brothers, intended to present the latest and most authoritative pictures of modern science in scientific and sociological fields.

PRACTICAL ELECTRIC ILLUMINATION. By Terrell Croft. New York: McGraw-Hill Book Company, Inc. 226 pages, 166 illustrations. Price, \$2.

This is a condensed compilation of some of the best information on illuminating engineering practice and available apparatus. The author is well known to have the art of presenting his facts in a clear and usable form, and this book comes up to that standard. Special care has been given to the diagrams and illustrations in order to present them in a clear manner, and certain mechanical analogies have been worked out by the author to explain the phenomena of light which assist in easy conception of the principles involved. Like many compilations from various authorities intelligently made, this book is probably of greater practical value than some more pretentious works in which there is not such correlation of the different parts. Extensive use has been made of publications in current practical literature and manufacturers' engineering data. The book first takes up fundamental ideas of light and radiation and then follows with principles and units, reflectors, incandescent lamps, arc lamps, mercury vapor and tube lamps, principles of illumination design, interior illumination and exterior illumination. The index is very full and complete. The book is evidently intended to be used hand in hand with the "American Electrician's Handbook" by the same author, as frequent references are made to tables found in that book. In many cases these tables are of equal importance in illumination work with those to which room is given in this book. The matter on glare and permissible brightness contrasts is not quite up to date. A strange error which has crept into paragraph 89 is the statement that it is desirable to express intrinsic brightness in candle-power per square inch because the numbers would be awkwardly large if they were expressed in lamberts. The lambert, which is the present recommended standard of technical societies, is equal to about 0.5 candle per square inch. As a whole, however, the book is probably one of the best of its size and kind now on the market.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

45,000-KW. TURBINE ADDED TO NEW ENGLAND RESOURCES

Narragansett Electric Lighting Company Places
Large New Generating Unit in Operation at
Providence—Power Needed

Within the last few days a 45,000-kw. turbine-generator set has been placed in operation at the South Street steam plant of the Narragansett Electric Lighting Company, Providence, R. I., increasing the generating capacity of the station to about 80,000 kw. and making the most notable single-unit addition in New England central-station history.

The new machine, believed to be the largest size to be placed in operation in the world to date, more than doubles the station rating and institutes a most welcome source of energy under present conditions in the New England power field.

HELP TO HYDROELECTRIC SYSTEM

The Narragansett company is the largest central station from which the New England Power Company purchases energy. The former is at present selling the latter company over 2,000,000 kw.-hr. per week, and installation of the new unit, with its guaranteed high efficiency in operation, will benefit the New England company's hydroelectric system to a notable extent in view of the present coal shortage, besides being of great value in handling the load at Providence and elsewhere on the Narragansett company lines.

The new unit was built by the Westinghouse company and has been installed under the direction of Francis Hodgkinson, chief engineer of the manufacturing organization, and Webster Talmadge of the Westinghouse New England staff. It is of the cross-compound type, consisting of a high-pressure turbine exhausting into a low-pressure turbine, the former running at 1800 r.p.m. and the latter at 1200 r.p.m. Each drives a direct-connected generator of 22,500 kw. rating, delivering 11,000-volt, three-phase, 60-cycle energy and designed to divide the load equally between the two. The unit is supported on a structural steel foundation, weighing about 515,000 lb. (233,600 kg.), the foundation being carried on a pile and concrete foundation formerly supporting a brick chimney. Steam is supplied at 200 lb. pressure (14.1 kg. per sq. cm.) and 100 deg. superheat, and the guaranteed water rates at various loads are as follows:

Power Factor 95 per Cent— Per Cent Load		Lb. Steam per Kw.-Hr.— 28.5-In. Vacuum 29-In. Vacuum	
	Kw.		
100	45,000	11.85	11.55
89	40,000	11.75	11.35
78	35,000	11.55	11.20
67	30,000	11.45	11.05
56	25,000	11.60	11.15
45	20,000	11.85	11.35
34	15,000	12.30	11.50

On account of the characteristics of the feed water and also because of space limitations, the condensing

equipment is of the jet type. There are two No. 24 Westinghouse LeBlanc low-level condensers capable of handling 18,000,000 lb. (8,572,897 kg.) of injection water and of condensing 500,000 lb. (226,796 kg.) of steam per hour to 28-in. vacuum, with cooling water at 70 deg. Each condenser is turbine-driven through gears and can be operated separately if desired. The condensers are mounted below the turbine, and salt water from the Providence River is used for injection purposes. Two free-exhaust pipes, 42 in. (106.68 cm.) in diameter, lead from the high-pressure side of the unit to outboard discharges, and two 42-in. back-pressure valves weighing 7000 lb. (3175 kg.) each are installed. The steam supply for the turbine is taken by a 24-in. (60.96-cm.) steel pipe from a horizontal

GIANT TURBINE-GENERATOR SET WILL HELP TO OVERCOME
EFFECT OF COAL SHORTAGE

boiler-room main, the turbine line being carried about 50 ft. (15.2 m.) away from the main to a U-head and thence back to the turbine-room wall and to the throttle, more than 100 ft. (30.4 m.) of pipe being installed to provide for expansion. This piping can be swayed slightly by hand, so that the turbine casing is freed from danger of injury due to pipe expansion. There are now twenty Babcock & Wilcox boilers in the plant, sixteen being rated at 600 hp. and four at 440 hp. All the boilers are equipped with seven-retort Taylor stokers. There are six steel stacks, each 217 ft. (66.14 m.) high above mean high water and 11 ft. (3.35 m.) in inside diameter.

The new unit occupies a space but 50 ft. (15.2 m.) long, 37 ft. (11.27 m.) wide and 18 ft. (5.48 m.) high. About 4,500,000 cu. ft. (127,000 cu. m.) of air per hour are required for generator ventilation, and it is estimated that if the entire output of the unit were utilized in the weaving of cotton cloth it would keep 125,960 looms busy and manufacture into fabric 574,692,000 lb. (260,000,000 kg.) of cotton per year.

The total weight of this great turbine unit is 1,380,000 lb. (625,957 kg.).

MEETING OF GOVERNORS OF ASSOCIATED MANUFACTURERS

John R. Rathom, Skillful Exposer of German Plots,
Is to Address Members of the Association at
Annual Banquet on March 21

A regular meeting of the board of governors of the Associated Manufacturers of Electrical Supplies will be held at 2:30 p. m. on Feb. 15 at the headquarters, New York. Final arrangements in connection with the annual meeting, as well as other important matters, will be discussed.

John R. Rathom, editor of the *Providence Journal*, which has exposed numerous German plots in the last three years, has consented to address the members of the association at the banquet following the annual meeting in New York on March 21.

MANUFACTURERS WORK TO CONSERVE INDUSTRY RESOURCES

"Manufacturer Can Manifest No Greater Patriotism
than by Consulting with Group Committee
Before Making Plant Extensions"

The General War Service Committee of the Electrical Manufacturing Industry has issued the following bulletin, entitled "Conservation of Industrial Resources," to every electrical manufacturer:

Your committee understands that it is the purpose of the federal government to conserve the industrial resources of the country to war needs and that when measures to that end are undertaken they will be in harmony with the following:

1. The full power of all industry, in all departments—labor, equipment and capital—must be utilized primarily for the successful prosecution of the war, to the end that all essential war products may be obtained in the quantities and at the time required.

2. Existing equipment, organizations and agencies will be utilized as far as possible with the least industrial disturbance and avoidance of too great concentration of war work in large industrial centers. It may be necessary to change the character of the work done, but every effort should be made to maintain a normal flow of trade through existing channels and conserve all industry for peace.

3. Plant extensions should not be made, or new plants created, when there is available unutilized national capacity that can be adapted to the needs of the hour.

4. Readjustment of so-called less essential business will be required only to the extent that such business interferes with the essential war program. When such readjustment is necessary the first appeal will be for voluntary action by the industrial group affected.

A function of the industrial representative of the War Industries Board will be to co-ordinate the industrial resources of the country, so as to utilize them with the least industrial disturbance. In sympathy with above course your committee urges electrical manufacturers, by means of their committee organization, to co-operate actively with the government.

During the period of the war a manufacturer can manifest no greater patriotism than by consulting with the appropriate group committee before undertaking any plant extensions.

It is not intended to deter any manufacturer from exercising individual initiative, or to check the normal growth of any business. On the contrary, it is most desirable that every manufacturer maintain his present organization at highest efficiency, making only such readjustments as will harmonize with government requirements.

It is in the interest of the electrical manufacturing industry that excess demand in the proper prosecution of the war shall be met:

1. By unutilized capacity within the group of manufacturers affected.

2. Within the electrical industry as a whole.

3. By unutilized capacity in another industry, presumably by the advice of the industrial representative of the War Industries Board.

To promote such a program, each group committee is requested to keep informed as to excess demand and surplus capacity in its respective lines, and whenever necessary to confer with the general committee.

The committee has also issued a bulletin showing its organization and stating its functions.

COMPTROLLER OF CURRENCY SEES NEEDS OF UTILITIES

Warning that They Must Be Kept Efficient and Solvent as War Measure—Protect Owners
Against Unjust Loss

In his annual report, just sent to Congress, Comptroller of the Currency Williams says that national and state banks and many thousands of small and large investors have suffered seriously from the decline of the earning capacity of public utility corporations and the consequent shrinkage in the value of their securities, representing investments of many hundred millions of dollars. These losses, he adds, naturally diminish the power and disposition of the public to respond to the calls of the government for money for war.

While Mr. Williams recognizes the shortcomings of some of these corporations, he says that generally they were able to serve the needs of their communities with reasonable efficiency and to earn fair returns on the money invested in them. He continues:

Now they are threatened with ruin. If they are allowed to sink into inefficiency, much of the important war work of the government will be crippled or paralyzed.

The continued and increasing efficiency of these corporations is important for the successful conduct of the war. This efficiency is not possible with present conditions. Corporations proved by their own figures to be approaching bankruptcy cannot obtain money for improvements or maintenance. On the other hand, banks and citizens suffering severe losses from investments in the securities of these entirely legitimate and once promising enterprises will be discouraged from lending money to the government or deprived of the means to lend.

The first and most direct relief to the public utilities corporations can be given by the state public utilities commissions and municipal and local authorities, with the broad-minded co-operation of the people generally, notwithstanding the necessities of war and realizing that the more promptly its burdens are accepted the sooner they will be lifted. It is essential that forbearance and consideration be exercised by the state commissions and municipal authorities, and that the corporations also be permitted to make such additions to their charges for services as will keep in them the breath of solvency, protect their owners against unjust loss, and give them a basis of credit on which they may obtain the funds with which to meet the strain put on them by the government's needs. The breaking down of these corporations would be a national calamity.

I am impressed with the importance of early consideration by the Congress of some measure to provide, directly or indirectly, for advance of funds on some conservative basis to such of these corporations as need help most urgently so that they may give adequate service to the government. The remedy would be unusual, but the times are unusual.

Comptroller Williams also urges that banks should not take advantage of war conditions to exact heavy interest. He gives statistics of increased material cost supplied by utility associations.

INCREASE IN RATES

AT SHEBOYGAN, WIS.

Authority Granted Eastern Wisconsin Electric Company by Railroad Commission to Increase Power and Lighting Other Than Residential Rates

The Wisconsin Railroad Commission on Jan. 29 rendered a decision in connection with the application of the Eastern Wisconsin Electric Company to increase power and lighting rates, with the exception of residence lighting rates, at Sheboygan.

The company requested permission to increase the rates mentioned 0.75 cent per kilowatt-hour and to discontinue the sale of tickets at six for 25 cents.

The commission granted authority to increase power rates and all lighting rates other than residence lighting rates 0.25 cent per kilowatt-hour beginning on Feb. 1 and continuing to Aug. 1 of this year, when the former rates become effective, unless upon application the commission approves of a continuance of the rates granted under this emergency order. The minimum lighting rate was reduced from \$1 to 75 cents, and permission was granted to discontinue the sale of six tickets on the electric railway for 25 cents for the period mentioned.

The company has also made application to the commission for authority to increase lighting and power rates at Fond du Lac 1½ cents per kilowatt-hour and to eliminate the sale of the six tickets for 25 cents at that point, and an application has been filed and hearings held in connection with the elimination of eight tickets for 25 cents on the Oshkosh property of the company. No decisions have been rendered on the last two applications.

FUEL ADMINISTRATION

TAKES CONTROL OF OIL

Public Utilities, with Domestic Consumers, Rank Fifth in the Classes of Users Designated for Priority

By proclamation of the President, manufacturers and distributors of fuel oil, including gas oil, with an output of more than 100,000 barrels a year, are placed under the licensing system of the Fuel Administration, effective on Feb. 11.

Under the proclamation the licensee engaged in the distribution of fuel oil in that part of the United States east of the Rocky Mountains shall not without the consent of the United States Fuel Administrator make any deliveries of fuel oil to any customer of any one of the classes mentioned below until he shall have delivered to customers of every class designated by a power number with whom he may have a contract all fuel oil for which deliveries shall be then due upon such contract. Differentials as between members of the same class may be made only with the consent and under the direction of the United States Fuel Administrator:

1. Railroads and bunker fuel.
2. Export deliveries or shipments for the United States Army or Navy.
3. Export shipments for the navies and other war purposes of the allies.
4. Hospitals where oil is now being used as fuel.
5. Public utilities and domestic consumers now using fuel (including gas oil).
6. Shipyards engaged in government work.
7. Navy yards.
8. Arsenals.
9. Plants engaged in manufacture, production and storage of food prod-

ucts. 10. Army and navy cantonments where oil is now being used as fuel. 11. Industrial consumers engaged in the manufacture of munitions and other articles under government orders. 12. All other classes.

SAVING OF COAL MADE

BY THE PUBLIC UTILITIES

Electric and Gas Companies in Twenty-nine Large Cities Report Saving of 21.2 Per Cent During Five-Day Period

Dr. Garfield announced on Feb. 6 that, if possible, the Monday closing order would be rescinded after Feb. 11, but that will be determined by weather and general conditions. Railroad embargoes will be continued indefinitely. Dr. Garfield stated in referring to the conference of Fuel and Railroad Administration officials on Feb. 5 that without exception the Fuel Administrators present bore witness to the uniform and patriotic observance of the closing order on the part of all classes of the community.

The official statement says in part:

The effect of the closing order is not easily measured statistically, the more so because of extraordinary weather conditions, but the State Fuel Administrators report that substantial savings have been effected. The most exact estimates were submitted by the secretary of the National Committee on Gas and Electric Service. These figures were furnished by electric light, power and gas companies of twenty-nine of the largest cities of the country. The weighted average of the saving in five days from Jan. 17 to 22, inclusive, was 21.2 per cent, while the saving for Monday, Jan. 28, was 25.5 per cent of the amounts usually consumed.

Mr. Garfield is informed that the public utilities concerned did not consume on other days appreciably more than the normal amount of coal as a result of the shutdown.

It is estimated that the public utilities reporting furnish a fair index of the general saving in the communities involved.

CANADA NOW GETS A

WORKLESS DAY ORDER

D. H. McDougall Telegraphs "Electrical World" that as Principal Central Stations Have Hydroelectric Power Business Effect Is Slight

An order in council passed by the Dominion of Canada Cabinet on Feb. 4 on recommendation of Fuel Comptroller Magrath suspends operation of all manufacturing plants, including munitions, on Feb. 9, 10 and 11. It does not apply to Western Canada or the Maritime Provinces.

Exemptions similar to those in the United States regulation are granted. Heatless Mondays are ordered from Feb. 18 to March 25 for theaters and other amusement places. Golf, yacht, canoe, hunt and country clubs must close during March except on Wednesdays and Saturdays.

Mr. Magrath is in Washington co-operating with authorities there.

In answer to an inquiry, D. H. McDougall, president Canadian Electrical Association, Toronto, telegraphs the ELECTRICAL WORLD:

Inasmuch as all principal Canadian central stations are supplied from hydraulic power plants Fuel Commissioner's order will have little effect on the business, large part of load, used by furnaces and other munition plants, requiring no fuel. Principal loss will be from store and office revenue.

SIDELIGHTS ON THE EVENTS AT WASHINGTON

The \$10,000,000,000 Which Must Be Raised, Needs of Industry, the War Finance Corporation and a Little Politics

(By Our Washington Correspondent)

A few days ago the United States Treasury disbursed \$86,000,000 in one day. And now it is getting to be pretty well understood that it is necessary to raise before the end of the fiscal year for war needs of the United States and the Allies \$10,000,000,000.

There must be money raised, too, with which to run business, so that business may produce in taxes the money with which to run the war. In this situation, now being driven home with force in Washington, it is proposed that Congress shall create a "War Finance Corporation," with a cash capital of \$500,000,000 and authority to issue and sell \$4,000,000,000 in short-term notes, for financing private war industrial operations. These phrases are other terms for the creation again of priorities—this time, priorities in money and for private industry, not for the government. It is a trifle early to say what Congress will do. The best judgment obtainable in Washington, where so many leaders in the industrial world are now living for the period of the war, is that some form of "War Finance Corporation" to keep private industry going has become a vital necessity.

Many other very interesting things are coming to the surface. A good portion of the money that was tied up in Russian contracts is, of course, diverted; and recently the French government, pointing out that nothing is gained by paying for machinery and materials in this country unless ships can be furnished to carry the machinery and materials to France, had its representatives here discuss with American contractors a basis for the liquidation of contracts, and millions of dollars of machinery contracts were so liquidated. As to Russia, in particular, business men now in Washington insist that there is no cause for alarm concerning the future.

There is much gossip in regard to the growing power and responsibilities of Secretary McAdoo of the Treasury Department. If there is one thing in the way of the easy passage by Congress of the "War Finance Corporation" bill, it is the fact that Secretary McAdoo has had thrust upon his shoulders almost too much work, almost too much responsibility. None the less Secretary McAdoo seems to bear up under the strain, and his friends are sincerely rejoicing that if politics does grow out of his enormous powers and responsibilities he stands a very good chance of being the logical nominee to succeed his distinguished father-in-law in the Presidential chair.

Why, the question is asked, has Edward R. Stettinius, formerly of J. P. Morgan & Company, who for more than three years had absolute control of purchases of the Allies in the United States, been brought to Washington as a "surveyor general" for army purchases, only to report to the highest authorities through

a series of steps beginning with an army colonel? The idea of Mr. Stettinius "reporting" through boards and councils and subordinates, in view of the fact that he is one of the best qualified men to direct all war purchasing, is really laughable. If the war council of the Secretary of War decides that it is policy to purchase a large quantity of this or that, General Goethals, the new acting quartermaster-general, is informed; and then General Goethals asks Colonel Palmer M. Pierce, the new director of purchases, to go ahead, and the Colonel Pierce refers the request to Mr. Stettinius. The latter's recommendation then goes to Colonel Pierce and from him to General Goethals, and the latter is to let the contract. In case of disagreement, Secretary Baker is referee. It seems a roundabout method, and there is talk of reassigning Mr. Stettinius. Perhaps it is not roundabout in practice. The best thing to do in Washington is to have confidence.

LABOR ADVISORY COUNCIL IS OF LARGE IMPORTANCE

National Body Will Formulate Program and Recommend Administrative Machinery on Every Phase of Employment Problem

The first official recognition of the need for a broad consideration of the labor problem was the appointment of an advisory council to the Secretary of Labor.

The council will consider the establishment in the Department of Labor of agencies to perform the following functions:

1. A means of furnishing an adequate and stable supply of labor to war industries. This would embrace:
 - (a) A satisfactory system of labor exchanges.
 - (b) A satisfactory method and administration of training of workers.
 - (c) An agency for determining priorities of labor demand.
 - (d) Agencies for dilution of skilled labor as and where needed.
2. Machinery for immediate and equitable adjustment of disputes in accordance with principles to be agreed upon between labor and capital and without stoppage of work, dealing with demands concerning wages, hours, shop conditions, etc.
3. Machinery for safeguarding conditions of labor in production of war essentials, including industrial hygiene, safety, women and child labor, etc.
4. Machinery for safeguarding conditions of living, including housing, transportation, etc.
5. A body to assemble and present data collected through existing governmental agencies or by independent research to furnish information necessary for effective executive action.
6. A publicity and educational division, developing sound public sentiment, securing exchange of information between departments of labor administration, and promoting in industrial plants the local machinery helpful in carrying out a national labor program.

The council is headed by John Lind, former Governor of Minnesota and envoy to Mexico, representing the public. Waddill Catchings, president Sloss-Sheffield Steel & Iron Company and Platt Iron Works, and A. Landon, general manager American Radiator Company, represent employers. Labor members are John Lennon, treasurer American Federation of Labor, and John J. Casey, former member of Congress. Dr. L. Marshall, University of Chicago, is the economist member, and Agnes Nestor, Chicago, represents women.

MEMPHIS MEETING OF THE ELECTRICAL INSPECTORS

Annual Meeting of Western Association Discusses
Conservation of Foodstuffs, Munitions and
Property by Means of Inspection

Conservation of foodstuffs, munitions of war and property by means of inspection was the keynote sounded throughout the thirteenth annual meeting of the Western Association of Electrical Inspectors at Memphis on Jan. 29, 30 and 31.

Important topics discussed were: "Distinguishing Electrical Signal Systems," "Hazards in Elevator Wiring," "Methods of Grounding Secondaries," "The Demand Factor of Lighting, Elevator and Power Circuits," "Electricity on the Farm" and "War Service of the Underwriters' Laboratories." Some of the points brought out and conclusions arrived at by the convention follow:

SUMMARY OF POINTS DISCUSSED

The electrical inspector must not only make electrical recommendations, but he should compel the property owners to employ sufficient capable and instructed watchmen and install adequate signal protective devices. In making recommendations the inspector should not merely say, "Overhaul the job," but should give specific recommendations that can be complied with immediately by the non-electrical man who is the property owner.

Electric signal systems approved by the Underwriters' Laboratories should be allowed, notwithstanding the fact that they do not comply with the National Electrical Safety Code requirements on high-voltage bell wiring.

The opinion prevailed that wires in elevator shafts should be inclosed in rigid conduit instead of armored cable as allowed by the National Electrical Safety Code, because the latter, if shaken loose from holdings by vibration or other means, would have a tendency to swing against the moving elevator and produce a fire and life hazard.

General discussion showed that many methods are used in grounding the secondaries, but it was agreed that the matter must be considered under local existing conditions in the municipalities. The Memphis Gas & Electric Company assumes the ground-wire responsibility and does not allow contractors to make grounds on the street side of the water mains as recommended in the code. Central stations can be shown that they should co-operate in this problem, but should not be forced by an ordinance to shoulder the entire responsibility.

By testing, the demand factor of power, elevator and lighting circuits can be determined, and if used in calculating the size of wire instead of the hard and fast rule of 100 per cent a conservation of from 25 to 30 per cent of copper can be made.

Farm-lighting systems help in obtaining efficient methods for needful farm production and make farmers contented to stay on the farm, where they can enjoy all the conveniences of city life.

The Underwriters' Laboratories have standardized specifications in fire hose and fabricated roofing materials for war purposes, thus making it possible for the government to obtain materials with several times the

speed that could have been secured under ordinary conditions. Efficient inspectors were valuable because of the fact that the government would have been compelled to secure and train men with a great loss of time.

The nominating committee named the following for officers: President, Frank L. Lucas; first vice-president, C. K. Cregier; second vice-president, K. W. Adkins; secretary and treasurer, W. S. Boyd; executive committee, Oscar W. Tryham, chairman; R. E. Moran, H. M. Beal, H. J. Clark, C. R. George, C. M. Tart and the officers.

PROGRESS IN THE NEW PLANT AT KANSAS CITY

Co-operation from Federal Authorities in Granting
Necessary Priority Orders Is Helping Con-
struction of the Large Station

Construction of the new power plant of the Kansas City Light & Power Company at Kansas City, Mo., is progressing at a satisfactory rate. Gratifying co-operation has been received at every step from the federal

PRIORITY ORDERS HELP THIS NECESSARY CONSTRUCTION

agencies. An original blanket priority order for all materials and equipment had been granted; while this was canceled later, priority orders are being granted in detail on various items as their need arises.

The experience of power users and domestic consumers in Kansas City this winter has demonstrated the real need for the new station. The peak load on the central stations in Kansas City this winter for street railway, light and power has been 57,000 kw., and 13,000 kw. of business has been cut off or denied. The light company has not solicited any new business for two years. It is estimated that Kansas City will use at least 90,000 kw. next winter if the energy is available.

The building plants provide for 300,000 kw. in the unit as laid out, of which 40,000 kw., in two 20,000-kw. machines, is in the first installation, expected to be in service by Nov. 1, 1918.

The plant is being erected on twenty-five acres (10.11 hectares) of river-bottom land, adjoining the Missouri River.

PROGRAM FOR A. I. E. E. MIDWINTER CONVENTION

At New York Convention on Feb. 15 and 16 Circuit-Breaker Ratings and Meters and Measurements Will Be Discussed

The sixth annual midwinter convention of the American Institute of Electrical Engineers will be held Feb. 15 and 16 in the Engineering Societies Building, New York.

On account of war conditions the meetings and papers committee, with approval of the directors, has decided to make the convention purely a business meeting. Therefore no entertainment features or excursions have been included.

The convention will include four technical sessions on the morning, afternoon and evening of Friday and on Saturday morning. A strictly informal dinner will be held between the afternoon and evening sessions on Friday.

The regular monthly meeting of the board of directors will be held on the preceding Thursday at 8 p. m. at Institute headquarters.

The program follows:

FRIDAY, FEB. 15

10:30 a. m.—Opening remarks by President E. W. Rice, Jr.; session on circuit-breaker rating: "Rating and Selection of Oil Circuit Breakers," E. M. Hewlett, J. M. Mahoney and G. A. Burnham.

2:30 p. m.—Session on meters and measurements: "A New Standard for Current and Potential," C. T. Allcutt; "The Thermoelectric Standard Cell," C. A. Hoxie; "The Character of the Thermal Storage Demand Meter," P. M. Lincoln; "Measurement of Power Losses in Dielectrics of Three-Conductor High-Tension Cables," F. M. Farmer.

6:30 p. m.—Informal dinner at Café Boulevard, Forty-first Street and Broadway; subscription, \$2 per cover. President Rice will speak on a timely topic at the dinner.

8:30 p. m.—Lecture, "Some Applications of Electromagnetic Theory to Matter," Dr. A. C. Crehore; to be followed by discussion.

SATURDAY, FEB. 16

10:30 a. m.—Session on alternating-current commutator motors: "Commutation in Alternating-Current Machinery," Marius A. C. Latour; "The Secom—A Kinematic Device Which Imitates the Performance of a Series-Wound Commutating Motor," V. Karapetoff; "The Polyphase Shunt Motor," W. C. K. Altes.

CANDIDATES PROPOSED FOR NOMINATION IN A. I. E. E.

Comfort A. Adams and J. Franklin Stevens Named for President, but Latter Requests Withdrawal of His Name

The following candidates have been proposed for nomination by petition in the American Institute of Electrical Engineers:

For president—Comfort A. Adams, Cambridge, Mass.; J. Franklin Stevens,* Philadelphia.

For vice-presidents—Allen H. Babcock, San Francisco; William B. Jackson, Chicago; F. B. Jewett, New York; Raymond S. Kelsch, Montreal; Harold Pender, Philadelphia; John B. Taylor, Schenectady.

For managers—Charles I. Burkholder, Charlotte, N. C.; G. E. Faccioli, Pittsfield, Mass.; Morton G. Lloyd, Washington; Frank D. Newbury, Pittsburgh; Walter I. Slichter, New York.

*This candidate has requested that his name be withdrawn.

ELECTRIFY ROADS AND SAVE WATER POWER, SAYS MR. RICE

Addressing Lynn Section, the A. I. E. E. President Draws Needed Lessons from the Penalty of Our Wasteful National Policies

Before 600 members and guests of the Lynn (Mass.) Section of the American Institute of Electrical Engineers on February 2 E. W. Rice, Jr., president of the national body and of the General Electric Company, urged general electrification of railroads and comprehensive development of water powers in the United States as a means of conserving fuel and increasing transportation efficiency under the war conditions that now exist.

The annual dinner of the Lynn Section was held in the new Thomson Research Laboratory at the River Works of the General Electric Company, and the speakers also included W. C. Fish, general manager of the Lynn works, toastmaster; Lieutenant Governor Coolidge of Massachusetts, Mayor Creamer of Lynn, Capt. F. P. Dawe of the Second Canadian Artillery, and Prof. Elihu Thomson, consulting engineer of the company. The Lynn Section, with 1650 members, is the largest in the country. Chairman J. M. Davis presided. The meeting dedicated the new laboratory to the service of the company, and in responding to the call of the toastmaster Professor Thomson contrasted the early facilities at his disposal with the present plant and gave many interesting reminiscences of electrical development. Concluding, he summarized the vital importance of research under war conditions as well as in peace.

MR. RICE ON WAR PROBLEMS

In prefacing his address, Mr. Rice paid high tribute to the achievements of the country in war preparations since the declaration of hostilities. He shared widespread regret that these preparations were not begun two years earlier, but pointed out that it is a waste of time to dwell upon this aspect of the war problem. The single object to-day is the winning of the war, and the utmost efforts and highest co-operation are needed to accomplish this.

The country is indeed fortunate, the speaker said, that its President is the true spokesman of its ideals, and because of his genius he has become the spokesman for all on the Allied side. It is fortunate for the world's future that the utterances of President Wilson exhibit no ground for looking toward an inconclusive peace. The vital necessity is to throw our full strength into our military, naval and industrial power. It is a happiness to think that no President has ever received such support as the country has given Mr. Wilson since war was declared. All interests want to give advice to the administration, but apparently the Democrats want no advice from the Republicans.

"Recent events have mystified, but I hope have not discouraged, the average citizen," said Mr. Rice.

The speaker pointed out how the entire country had been stunned by the recent closing order and has become nervous and critical as a result. He emphasized the point that the country has not made a failure of its war preparations, but that all is moving as well as could be expected under the circumstances of unpreparedness under which the United States took up its huge task.

"Notwithstanding a distinguished authority," said

Mr. Rice, "a million men cannot spring to arms overnight, nor can all the great mechanism of war be produced in a year. A certain minimum time is necessary to get ready, and all we can do is to see that that minimum is not unduly prolonged.

"This is a people's war—a war for democracy. It should not be handled as a war to be conducted merely by the party in power; all the people must be represented. The questioning attitude of the country arises from the fear that the ability and experience and wisdom of the whole country is not being called upon. Governmental methods suited to peace times do not fit war conditions."

Mr. Rice said that something like the coalition government formed in England appears desirable here. There is no lack of confidence in the good intentions of our leaders, but we need the wisdom and experience of all the country and not of one-half of it; we need men who take to team play as a duck takes to water. Now that the government has taken over the railroads, ability in the representatives of the people is more needed than ever. In future there will be a more general interest in public affairs, and the speaker urged all engineers to take such an interest, maintaining that all classes of professional and business men should be represented in the government.

LESSONS OF THE COAL FAMINE

Discussing the economic value of water-power development and railroad electrification, Mr. Rice said in part:

We are now in the midst of an extraordinary coal famine due to causes which it is unnecessary and perhaps undesirable for us to attempt to outline. However, I would like to point out in the first place how much worse the situation might have been were it not for the contributions of the electrical engineer and manufacturer, and second, how much better our condition might have been if our contributions had been more extensively utilized.

Suppose we assume that the present serious situation is due to a lack of production of coal. It is comforting to consider to what extent conditions surrounding such production have been improved and how the amount of coal mined has been already increased by the use of electrical devices in connection with coal mining—such for example as the electric light, electric coal cutters, electric drills and electric mining and hauling locomotives. I have no figures before me, but I think it is a fairly safe assumption that the amount of coal mined has been increased at least 25 per cent on the average by the employment of such electrical devices. If this estimate were cut down to 10 per cent, it would still leave an increase in the tonnage of coal produced of something like 50,000,000 tons during the past year.

If, on the other hand, the difficulty is not due to a shortage in the production of coal, but rather to the failure of the distributive agencies of the country, it is interesting to see how this difficulty would have been largely removed if the railroads of the country were operated by electricity instead of steam.

Where electricity has been substituted for steam in the operation of railroads, 10 to 50 per cent increase in actual capacity of existing tracks and other facilities has been demonstrated. This increased capacity has been due to a variety of causes, but largely to the increased reliability and capacity, under all conditions of service, of electrical locomotives. This has enabled a speeding up of the train schedules by some 25 per cent, under average conditions. Of course, under the conditions which prevail in extreme cold weather, when the steam locomotives practically go out of business, the electric locomotives make an even better showing.

It is therefore not too much to say that if the roads of the country were now electrified no breakdown of our coal supply, due at least to failure of distribution, would exist.

But this is not all. It is estimated that something like 125,000,000 tons of coal were consumed by the railroads in the year 1915. Now, we know from the results already obtained from such electrical operation as we have had in this country that it would be possible to save at least two-thirds of this coal if electrified locomotives were substituted for the present steam locomotives. On this basis there would be a saving of over 80,000,000 tons of coal. Even if only half of this saving were realized in practice, I think we can justly claim that there would have been no coal shortage at present if the roads had been electrified.

It is estimated that there is not less than 25,000,000 hp. of water power available in the United States, and if this were developed and could be used in driving our railroads, each horsepower so used would save at least 6 lb. (2.7 kg.) of coal per horsepower-hour now burned under the boilers of our steam locomotives. Unfortunately this water power is not uniformly distributed in the districts where the railroad requirements are greatest, but the possibilities indicated by the figures are so impressive as to justify careful examination as to the extent to which water power could be so employed and the amount of coal saving which could be realized.

The terrors of these "heatless days" will not have been without benefit if they direct the attention of the people and of our lawmakers to the frightful waste of two of our country's most valuable assets—our potential water power and our coal reserves. The first, potential water power, is lost because it is allowed to run to waste, undeveloped, unused. The second asset, coal, is wasted for exactly the opposite reason. It is being used, but in a frightfully ineffective and inefficient manner.

The waterfalls constitute potential wealth which can only be truly conserved by development and use—millions of horsepower are running to waste every day, which once harnessed for the benefit of mankind become a perpetual source of wealth and prosperity.

It is really terrifying to realize that 25 per cent of the enormous amount of coal which we are digging from the earth each year is burned to operate our railroads under such inefficient conditions that the average of 6 lb. of coal is required per horsepower-hour. The same amount of coal burned in a modern central power station would produce equivalent to three times that amount of power in the motors of an electric locomotive, even including all the losses of generation and transmission from the source of power to the locomotive.

Where water power may be utilized, as in our mountainous districts in the West, all of the coal used for steam locomotives can be saved. In the middle Atlantic States, however, water powers are not sufficient, and it will be necessary in a scheme of electrification that the locomotives be operated from steam-turbine stations.

We should not be justified in being so confident of the benefits of electrification of railroads if every element in the problem had not been solved in a thoroughly practical manner. The electric generating power stations, operated either by water or by steam turbine, have reached the highest degree of perfection, efficiency and reliability, while the transmission of electricity over long distances with reliability has become a commonplace.

It may be said that the present is not a propitious time in which to deflect any of the country's capital into railroad electrification. I think that in spite of the enormous advantages of which I have spoken, we should be inclined to agree with such a point of view if it were not for the recent unpleasant demonstration of the apparent failure of our railroad transportation systems to meet the demands which have been placed upon them by the industries, aggravated it is true by the war conditions and also by the unkindness of the weather.

What assurance have we that the present conditions are temporary, and even if they improve as they surely shall with the coming of warm weather, what are we going to do next winter? Of course, even if we should start electrification at once, we could not have all our railroads electrified by next winter, but we could have a good start, and as was said about the resumption of specie payments, "The way to resume is to resume," so "The way to electrify is to electrify."

LESSONS OF THE WAR FOR ELECTRIC UTILITIES

The Problems of Capital, Rates, Extensions, Operating Cost, Fuel Supply, Transportation and Public Policy

BY JOHN F. GILCHRIST

[The following paragraphs are extracts from a timely address made by Mr. Gilchrist, vice-president Commonwealth Edison Company of Chicago, before the Indiana Engineering Society, Indianapolis, on Jan. 25.]

It seems to me that these coal holidays have demonstrated most conclusively one thing, that if there was anything in which this country was not prepared it was its lack of preparation in its transportation facilities, in its transportation system. I believe that, owing to shortsighted policies of the management of transportation systems which in turn developed a hostility among our people until the transportation systems were not accorded the support they should have had, the factor which they were in the prosperity of the country was misunderstood, or not understood, to such an extent that it has resulted in the most deplorable unpreparedness of transportation facilities.

NECESSITY OF RESOURCEFULNESS

The utilities, and the railroads too, have without doubt brought much of the attitude, if not all of the attitude, of the people upon themselves, and the best thing that has happened to the utilities of the country, in my judgment, is the general establishment of commissions in the various states for the regulation of the utilities. I venture the assertion that if those commissions (a very large percentage of which are working honestly and intelligently to grasp the utility business and to work out the problems with which they are confronted) had had another five years before the breaking out of this war, our utilities would have been found to have been in very much better position to resist the demands which are being made upon them than they are to-day.

I believe it is only by the education of the people, by a period of overcoming the prejudice and the rightful aversion which many of our people feel toward the public utilities, and by educating them to the fact that the prosperity of the utility and the prosperity of the community are so closely linked up together that one cannot be prosperous without the other, that matters will be improved.

The growing difficulty in placing their capital stock impressed itself very forcibly upon the utilities. This was very largely a question of lack of capital in the country, because when the government began to go into the market for money, selling its securities, not only did it clean the money up so that the investor in other shares and bonds could not be found, but the government was in the market sixty days of last year, and indications are that it may be in the market anywhere from ninety days to six months this year, and during the time when the government is in the market it is not patriotic, ethical or practical for any one else to try to sell securities. It cannot be done.

INCREASED COSTS AND STATIONARY RATES

In many companies the increased costs, while the rates remained the same, left the margin of net nar-

rower and narrower, and it was impossible to show earnings which were an inducement to the investor.

The great increase in expense was increase of cost for fuel. Some of the companies had provided themselves with mines and were in a position where the increase in the cost of fuel did not affect them so much as it affected the average concern that purchased its fuel under contract or on the market, because if the utilities had favorable contracts with coal companies they were rarely made—hardly ever made, you might say—for more than two years, and frequently for only one year, and that time was soon gone.

So we come to a situation where there are only one or two things to do for the utilities. Utilities must either stop spending money or they must find some way of raising money, and in order to raise money they must be able to make a very good showing, because in these times the industries are making such wonderful returns on the capital invested in their business that they naturally attract what capital there is and the attention of investors, so that the tendency is to get away from the securities of the public utilities.

GROWTH AND STRENGTH MUST BE MAINTAINED

The utilities must be kept growing and kept strong, and the utilities must go to the commissions in their various states and must ask for relief and for prompt relief, and ask it as a war emergency. I do not think it is fair to ask the commissions to pass quickly on the situation for anything other than as a war emergency; because if it were done on any other basis it might be quite possible that utilities would get by, as the saying is, without a proper investigation as to their invested capital and what they were fairly entitled to in the matter of rates and in the matter of return on that capital. On the other hand, it is not fair to the country and it is not fair to the utilities which have this responsibility thrust upon them to attempt to get at an adjustment of rates by the appraisal method, because there are not engineers enough in the country, especially in view of the demand the war is making upon them, to appraise these properties and get at the results in that way, in order to be of any service in the war.

Another thing which the utilities must do, and which they, of course, must have the approval of the regulating bodies to do, is to shut down absolutely on the spending of money for extensions for anything which is not essential to the winning of the war. I know a case within the Middle West territory where, in a mining situation, \$250,000 was asked and put up promptly to build the necessary lines to and in the necessary plant in order to equip those mines, so that they could turn out promptly the product which is so badly wanted by our nation, and it is perfectly fitting that that should be done.

I can cite a case in Ohio where a manufacturing institution was taking at the outbreak of the war a very large amount of power from the electric utility and as a result of war orders it more than doubled its demand. In the meantime the costs had gone up so that the price under a five-year contract was so low that the utility was losing on that one customer \$50,000 a month, and it stood the gaff for ten months or thereabouts, until it finally got its courage up and went to the Ohio commission and got, very cheerfully, relief on a showing of the situation.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Los Angeles Synchronous Club.—At the Jan. 17 meeting of the Synchronous Club, lecture No. 7 of the synchronous electrical course on "Motor Applications" was given by R. H. Cates, power engineer Southern California Edison Company.

Springfield Engineers' Club.—H. B. Lewis, plant superintendent of the Central Union Telephone Company, has been elected president and J. R. Hughes, assistant engineer State Public Utilities Commission, has been elected secretary of the Springfield Engineers' Club of Springfield, Ill.

Schenectady Section, A. I. E. E.—Bassett Jones, consulting electrical engineer, associated with Henry C. Meyer, Jr., of New York City, presented a paper on "Standardized Flexible Distributing Systems in Industrial Plants" at a meeting of the Schenectady Section of the A. I. E. E. held Feb. 1.

Annual Meeting of the Barstow Club.—The Barstow Club, an organization of the employees of the Sandusky Gas & Electric Company of Sandusky, Ohio, held its annual meeting at the office of the company recently and elected Albert Bitzer of the electric department president and Frank Kelly of the gas department secretary.

Jovian Electric League of Kansas City.—The January meeting of the Jovian Electric League of Kansas City, held Jan. 25 at the Muehlebach Hotel, was distinguished by the presence of many out-of-town visitors, including some Jovians now in army service. H. P. Wright, president of the H. P. Wright Investment Company, delivered an address on "The Outlook—Business Present and Future."

Northwest Electric Light and Power Association Committees Appointed.—President Talbot of the Northwest Electric Light and Power Association recently appointed the following committees for the association year 1917-1918: Public policy committee—F. T. Griffith, chairman; H. L. Bleeker, Elmer Dover, F. A. Harmon, J. A. Laing and A. W. Leonard. Hydroelectric and technical committee—George E. Quinn, chairman; R. M. Boykin, J. B. Fiske, L. T. Merwin, F. D. Nims and H. H. Schoolfield. Labor study committee—S. R. Inch, chairman; C. S. MacCalla and W. H. McGrath. Electric-range committee—W. R. Putnam, chairman; M. C. Osburn and A. C. McMicken. Program committee—Lewis A. McArthur, chairman; R. W. Clark, C. P. Osborne and G. C. Sawyer. Entertainment committee—C. R. Young, chairman; G. G. Bowen, W. H. Lines, A. S. Moody and Carl L. Wernicke.

Jovian Electric League, Los Angeles.—At the regular Wednesday luncheon of the league, Jan. 30, Senator L. H. Roseberry spoke on "Some Modern Phases of Socialism." L. D. Wishard of Pasadena, who has done special Y. M. C. A. work in Europe, gave a talk on this work. James M. Colkitt, manager Los Angeles branch John A. Roebling's Sons Company of California, was chairman of the day.

San Francisco Electrical Development and Jovian League.—The Jan. 23 meeting of the association was designated "Architects' Day," local members of the American Institute of Architects being invited. The subject discussed was "The Architect's Relation to the Electrical Industry." Spokesmen for the architects were Louis C. Mullgardt, B. R. Maybeck and Sylvain Schnaittacher, and for the electrical interests H. C. Reid and H. P. Pitts.

Pacific Coast Electrical Supply Jobbers' Association.—The annual meeting of the Pacific Coast Electrical Supply Jobbers' Association was held at Del Monte, Cal., Jan. 24-26. At the open meeting a paper on the conservation of labor was read by E. J. Wallis, Pacific Coast manager Western Electric Company. The annual election of officers resulted as follows: President, W. S. Berry; secretary, Albert H. Elliot; new member executive committee, Tracy E. Bibbins.

Association of Iron and Steel Electrical Engineers.—For the ensuing year the following members will act as chairmen of the respective committees of this association: W. T. Snyder, chairman standardization committee, National Tube Company, McKeesport, Pa.; W. O. Oschman, chairman power committee, Oliver Iron & Steel Company, Pittsburgh, Pa.; A. H. Swartz, chairman publicity and promotion committee, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.; K. H. Cederland, chairman electric furnace committee, Duquesne Steel Works, Carnegie Steel Company, Duquesne, Pa.; J. F. Kelly, chairman membership committee, National Tube Company, McKeesport, Pa.; Walter Greenwood, chairman safety committee, Carnegie Steel Company, Youngstown, Ohio; B. W. Gilson, chairman educational committee, Carnegie Steel Company, Youngstown, Ohio; E. Friedlander, chairman editing committee, Carnegie Steel Company, Edgar Thomson Works, Braddock, Pa.; A. H. Swartz, chairman convention committee, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.; W. C. Kennedy, chairman electrical development committee, Standard Seamless Tube Company, Ambridge, Pa.; F. D. Egan, chairman finance committee, Pittsburgh Iron & Steel Foundries Company, Midland, Pa. The next annual convention will be held either in New York or Baltimore Sept. 9-13, 1918. A paper on "Alternating-Current and Direct-Current Skip Hoists" will be presented by Mr. Lindquist of the Otis Elevator Company at the Pittsburgh Section meeting at the Hotel Chatham, Feb. 16.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Increase in Rates in Illinois.—The Southern Illinois Light & Power Company has filed a petition with the Illinois Public Utilities Commission seeking to increase rates in Litchfield and Hillsboro.

Depreciation Order Upheld.—The Appellate Division of the New York Supreme Court, First Department, has handed down a decision dismissing a writ of certiorari obtained by the New York Railways Company and affirming an order made by the New York Public Service Commission, First District, requiring the railway company to set aside 20 per cent of gross operating revenues, month by month, to provide for maintenance and depreciation of its properties. The commission order was made as a result of reorganization proceedings relative to the old Metropolitan street railway system. The New York Railways Company has been setting aside the 20 per cent required, although contesting the power of the commission to determine what amount should be so set aside for the purpose and for what it should be expended. The company contended that its directors rather than the commission should determine the amount of the company's depreciation reserve.

Municipal Plant Abandons Plan to Decrease Rates.—The Indiana Public Service Commission has dismissed a petition filed by the city of Crawfordsville for authority to decrease electric rates. On Nov. 30, 1917, the city of Crawfordsville filed with the commission its petition praying for authority to decrease electric light and power rates. F. H. Miller, superintendent of the municipal electric light and power plant, in asking that this petition be dismissed, filed with the commission a resolution by the Mayor and Common Council directing that this action be taken. In its decision the Public Service Commission says: "It appearing that the municipality of Crawfordsville, as now organized, desires this petition dismissed; it being known to this commission that the rates charged for electric energy by petitioner are, compared with rates generally charged in Indiana cities of like size, generally low and not extortionate or unreasonable; it being further known to this commission that the costs of future operation during the war period are uncertain but with an upward tendency, and also there being no protest received against the action of said Common Council and Mayor, the prayer to dismiss will be granted, with the modification that said dismissal will be without prejudice to the interest of any party."

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Hartford (Conn.) Electric Light Company Dividend Reduced.—An official statement says: "The directors have voted to decrease the dividend payable Feb. 1, 1918, from the 10 per cent to the 8 per cent basis, because it has been found that the increase in the price of energy made last July is insufficient to compensate both for the increase in the cost and for the reduction in revenue arising from the curtailment in the use of electric energy by the public."

American Light & Traction Results.—The increase in total gross business of the companies controlled by the American Light & Traction Company for the year ended Dec. 31, 1917, was \$2,307,138. The normal increase in net which would be expected to follow this large increase in gross has been offset by large increases in operating costs as follows: Increased cost, coal and oil, \$984,700; increased cost, operating labor, \$320,300; increased cost, labor and materials, \$1,305,000; increased taxes—federal, \$618,000; increased taxes—other taxes, \$87,000; total, \$2,010,000.

Insure the Men at the Front.—To safeguard American soldiers and sailors and their families, it is imperative that the fighting forces avail themselves of the full privileges conferred by the military and naval insurance act. For his own benefit and for his family every enlisted man and officer in the army and navy should take the full \$10,000 insurance. Insurance of almost \$4,000,000,000 has already been applied for, but this great total is only a beginning. The army and navy should be 100 per cent insured. Persons in service before Oct. 15, 1917, must apply on or before Feb. 12, 1918. Those who joined after Oct. 15, 1917, have 120 days from the date of enlistment in which to apply.

Louisville Company Releases Coal for the Public.—About 5000 homes were warm during the week of Jan. 28 because the Louisville Gas & Electric Company, through Donald McDonald, vice-president and general manager, threw on the open market at cost a reserve supply of 3500 tons of high-grade West Virginia bituminous coal. This coal, bought last summer, had been held until it was assured that the company's own new mines in western Kentucky could meet all possible requirements. At the earliest moment the coal was sold to the public at cost to relieve a very serious shortage. Householders sent their own conveyances while dealers also got in line. The cost at the company storage shed was \$5.25, below the market price.

Illinois Properties Seek Rate Increase.—A general increase in electric and gas rates, as well as street-railway fares, is asked in a petition filed by thirteen subsidiary companies of the Illinois Traction System before the Illinois Public Utilities Commission on Jan. 31. The increase asked in electric rates is from 6 to 20 per cent. The petition recites that, owing to the abnormal conditions caused by war and causing great increase in cost of producing electric and gas service, the companies are in need of immediate relief. Coal increases alone are said to be \$350,000. The commission has set Feb. 19 for a hearing.

Damage to Tacoma Power Plant.—Llewellyn Evans, superintendent Electric Works, Tacoma, Wash., states in regard to the damage done to the power plant by a recent flood: "The Tacoma municipal power plant was injured by flood during the last two weeks of December and was compelled to cut off two waste-power customers and to purchase some power. The repairs necessary to put the plant in normal shape again include the clearing of the intake and pondage behind the dam and the replacing of liner rings in the turbines. This plant has 20,000 kw. capacity in four units and is situated on the Nisqually River, which is a glacial stream. The operating head is 425 ft. The high water was 30 per cent higher than at any other time in the history of the plant. It was caused by hot winds melting the mountain snow, and by an incessant rainfall. Water came up 7 ft. in the basement of the power house, the surface of the water reaching within 2 in. of the exciter bus. The operating force prepared a temporary cable bus while the water was rising. Continuance of the flood brought down sand and logs and uprooted trees in such quantities that the intake was piled full, and even with a donkey engine and the liberal use of dynamite it was difficult to keep enough water running through the grate bars to run the plant. The two 8-ft. by 10-ft. wash-out gates were wide open but became choked so as to be of no use. The plant is provided with a 1000-ft. settling channel which was washed out daily, removing a layer of sand and silt 7 ft. deep. The regulating reservoir at the plant also accumulated 8 ft. of sand in the bottom, but still the water was dirty enough to cut the wearing parts of the waterwheels, resulting in the most serious damage. To make repairs to these, liner rings around the runners will have to be renewed, the sand-filled water having put the finishing touches to five years of wear. The damage at the intake can be brought back to normal readily with a derrick and orange-peel bucket now being installed. The waste-power customers were the American Nitrogen Products Company, which uses about 3000 kw., making sodium nitrate by the arc process, and the Bilrowe Alloys Company, which uses 1500 kw. in smelting ferro-manganese. The city purchased about \$600 worth of power from the Puget Sound Traction, Light & Power Company, with which it has a 12,000-kw. tie line."

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Admission of Evidence.—The admission of the evidence of an experienced telephone lineman that electrical wires will break in a certain manner was not a prejudicial error, the Supreme Court of Kansas held in *Lewis vs. Harvey* (168 P. 856).

Care Required of Electric Wires in Mines.—The employer must exercise the utmost care and skill not only in management and maintenance of electric wires in a mine but in their construction, proper construction of such wires being as necessary to the employee's safety as maintenance thereof after construction, the Court of Appeals of Kentucky held (198 S. W. 724).

Rates Requiring Summer Consumer to Pay Full Annual Rate.—Water rates at a summer resort are held in the Maine case of *Briggs versus Peaks Island Corporation* (P. U. R. 1917 E. 750) not unjustly discriminatory because they require the summer taker to pay the full yearly rate where the plant was built for and is measured by the summer demand and the year-round takers are the incidental consumers.

Foreman Not a Contractor.—An award of the Industrial Accident Commission must be sustained if there is any evidence to support its finding that the injured person was an employee of the party from whom compensation is sought, the District Court of Appeals of California held in *Yolo Water & Power Company versus Industrial Accident Commission of California* (168 P. 1146). An employer's foreman had full authority to hire whatever help he needed, and did hire men admitted to be employees of his employer, and also hired men and teams for a lump sum, and on at least one occasion hired a team separately. He also furnished his own team on some occasions, and the injured person at the time of his injury was driving the foreman's team. The foreman directed the drivers to exactly the same extent as other employees, and intended to engage the injured person as an employee of his employer, and the injured person, who had worked for the employer on numerous occasions, intended to work as usual as its employee. The foreman made no profit on the injured person's services as driver, the injured person being paid the usual wages for driving and the foreman retaining the amount usually paid for a team. It was held that the injured person was an employee of the general employer, and not an employee of the foreman, the contention that when the foreman obtained a team and a man together he stood in the position of a contractor being without merit.

A. L. Strickland has been appointed district manager of the Pacific Power & Light Company at Seaside, Ore., succeeding Harlow Moore, resigned.

Frank Carder has been appointed manager of the Oklahoma Gas & Electric Company, Norman (Okla.) division, succeeding W. P. Jones, resigned.

J. P. Pulliam, formerly with the Eastern Wisconsin Railway & Light Company, has been appointed general manager of the Wisconsin properties of the Wisconsin Securities Company.

W. D. Hodson, formerly superintendent of the Northern Ohio Traction & Light Company, has resigned to take an interest in the Imperial Electric Company of Akron, motor manufacturer.

C. C. Curtis, lighting superintendent of the El Paso (Tex.) Electric Company, has been appointed manager of the Cape Breton Electric Company, Ltd., succeeding E. L. Milliken, who was transferred.

G. A. De Haseth, formerly with the Tacoma Railway & Power Company, has been appointed manager of the Ponce (P. R.) Electric Company, succeeding P. M. Hatch, now in the Ordnance Department of the army.

C. R. Dillman, formerly with the Grand Rapids-Muskegon Power Company at Muskegon, Mich., has been placed in charge of the Akron (Ohio) Appliances salesroom of the Northern Ohio Traction & Light Company.

T. R. Steingoetager has been named business manager of the St. Clair County Gas & Electric Company, with headquarters at Belleville, Ill. He has been with the company since a boy and has served in late years as a traveling auditor and more recently as general auditor of the company at East St. Louis, Ill.

B. J. Caldwell, vice-president of the Caldwell Electric Corporation, Champaign, Ill., has been commissioned by the navy board to do electrical engineering work for the navy. Mr. Caldwell is a graduate of the college of engineering of the University of Illinois in the class of 1911 and has been electrical engineer for the Caldwell Electric Corporation since.

A. G. De Clercq has been appointed construction superintendent of the Commonwealth Edison Company to succeed J. H. Goehst, who before his death was the oldest employe in point of service with the Edison company. Mr. De Clercq's first work with the Commonwealth Edison Company began on May 6, 1899, soon after his return from Cuba with the Illinois Volunteers. It consisted of handling lamp renewals and doing work between times in the testing laboratory. In 1902 he took a leave of absence to enter the Michigan Agricultural College at Lansing. In 1903 he again entered the employ of the Commonwealth Edison Company and since that time has held many positions, including those of job foreman, division foreman, supervisor of station installation, division and assistant construction superintendent. He is at present the president of the Commonwealth Edison Section, N. E. L. A.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

C. R. Phenecie, vice-president of the Wisconsin Service Company, has been appointed general manager of the Wisconsin Security Company and will take up his headquarters at Green Bay as soon as he has completed work on an auxiliary plant at Manitowoc.

H. W. Courville has been promoted from superintendent of power distribution of the Consumers' Power Company, Jackson, Mich., to general superintendent of distribution in the Flint District. Mr. Courville was appointed local manager of the Commonwealth Power Company at Jackson in 1912, having before that been connected with the Denver Gas & Electric Company and more recently with the Butte Electric & Power Company.

L. A. PETTIT, JR.

L. A. Pettit, Jr., who has been associated with the Albert Emanuel Company for the last nine years as general manager of this property and also as treasurer and secretary of its several companies, has severed active connection with the company to engage in the business of controlling and managing public utility properties. Mr. Pettit will remain a director in the following companies operated by the Albert Emanuel Company: Consolidated Utilities Company, Kansas Electric Utilities Company, Emporia, Kan.; Morris County Light & Power Company, Council Grove, Kan.; Southwestern Utilities Company, Alva, Okla.; Williamson (West Va.) Light & Power Company; Union City (Ind.) Electric Company; Sidney (Ohio) Electric Company; Coal District Power Company, Fort Smith, Ark., and Utilities Lighting Company, Albion, Pa. Mr. Pettit also intends to engage in consulting engineering work on utility rates, developments, reports, etc.

H. O. Clarke, Jr., commercial manager of the Houston Lighting & Power Company, has received an appointment from the government to assist the local aviation construction and field officers in an advisory capacity in problems concerning their electrical installations at the local army cantonment.

George H. Losey, assistant general superintendent and electrical engineer for the Indiana Railway & Light Company, Kokomo, Ind., has resigned to become connected with the Great American Refining Company at Tulsa, Okla. Mr. Losey has been with the Kokomo company for the last ten years in various engineering capacities, starting in in the meter department and advancing through a line of promotions. He is a graduate of the electrical engineering course of Purdue University.

C. E. Bennett will be assistant to Charles G. Adsit, consulting engineer of the Georgia Railway & Power Company, Atlanta, Ga., after Feb. 15. Mr. Bennett, who a number of years ago was connected with the Georgia company, has been associated with Curtis A. Mees, consulting engineer of Charlotte, N. C., since last summer. In the summer of 1915 Mr. Bennett resigned the position of electrical engineer with the Northern Contracting Company and the Georgia Railway & Power Company to become associated with Hugh L. Thompson, consulting engineer of Waterbury, Conn. Prior to that time he was electrical engineer with L. B. Stillwell, New York City, and later with Charles O. Lenz of New York City, having been his principal assistant on the Tallulah Falls development of Georgia. He was also connected with the J. G. White Company of New York City. In the summer of 1917 he resigned as mechanical and electrical engineer for Mr. Thompson to become associated with Mr. Mees, as stated above.

Obituary

William Temple Emmet, a member of the Public Service Commission for the Second District of New York since March, 1914, died on Feb. 4 at the age of forty-nine years.

Judge R. S. Taylor of Fort Wayne, Ind., who some years ago was one of the leading patent attorneys of the country, particularly in the electrical field, died at his home on Jan. 28 at the age of seventy-nine. One of his earlier achievements in the patent field was in connection with a suit brought by the old Bush company of Cleveland for infringements on arc-lamp patents. Judge Taylor's victory in this case established the right of all companies to continue the manufacture of arc lamps. Later, as chief counsel for the independent telephone interests established after the old Bell patents had expired in 1893 against the Bell system, he succeeded in obtaining a decision granting the right to the independent companies to continue the use of the transmitter.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

OCTOBER EXPORTS OF ELECTRICAL PRODUCTS

Total Foreign Trade of That Month Officially Valued
at \$4,151,635. as Against a Total Value of
\$4,048,080 in October, 1916

Exports of electrical goods, apparatus, etc., for the month of October, 1917, were about on a level with those of the same month in 1916, namely, \$4,151,635 as against \$4,048,080. Battery exports in October last were nearly double those for October, 1916; dynamos and generators, however, indicate a marked falling off, as do insulated wire and cables, while, on the other hand, exports of metal-filament lamps were more than double.

For the ten months ended October, 1917, there was an increase in value of more than \$11,000,000 over the corresponding period a year previous. Every item in the list, which was compiled by the Bureau of Foreign and Domestic Commerce of the Department of Commerce, represents a larger volume than the same period in the previous year. Insulated wire and cables showed an increase of \$2,000,000; interior wiring supplies, including fixtures, nearly \$900,000; metal-filament lamps more than \$1,000,000, motors \$2,000,000, and transformers \$300,000. The official figures follow:

Articles	October		Ten Months Ended October	
	1916	1917	1916	1917
Batteries	\$173,734	\$275,721	\$1,504,788	\$2,843,768
Carbons		127,271		*463,451
Dynamos or generators	249,281	196,146	1,379,153	1,914,151
Fans	13,949	29,276	269,180	516,606
Heating and cooking apparatus		63,840		*149,236
Insulated wire and cables	575,024	306,713	3,587,342	5,797,767
Interior wiring supplies including fixtures	\$9,214	100,345	735,838	1,030,109
Arc lamps	644	737	13,590	14,152
Carbon-filament lamps	22,417	18,023	93,987	156,340
Metal-filament lamps	103,655	240,686	1,170,292	2,254,661
Magnetos, spark plugs, etc.		283,272		*995,617
Meters and measuring instruments ..	80,895	80,689	705,137	888,870
Motors	528,666	546,255	3,995,668	5,132,542
Rheostats and controllers		23,343		*61,188
Switches and accessories		82,782		*549,679
Telegraph apparatus, including wireless.	18,366	16,609	139,127	486,960
Telephones	105,146	210,276	1,322,939	1,705,521
Transformers	90,367	224,975	892,302	1,263,625
All other	1,996,722	1,324,676	15,266,360	18,153,343
Total	\$4,048,080	\$4,151,635	\$31,075,703	\$44,377,586

*Figures cover period beginning July 1.

SPECIFICATIONS FOR PACKING FOR EXPORT

Suggested Guides for Machinery Supplies and Equipment on Orders Issued by the General Engineer Depot

Recognizing the necessity for informing American manufacturers of the best practice for export packing, the General Engineer Depot, Washington, D. C., suggests the following specifications as guides for packing machinery, supplies and equipment for export or orders issued by its department:

"1. All merchandise must be protected by substantial

boxing and must be securely packed therein. Export shipping conditions involve much rougher handling than is usually understood.

"2. All packing should be as light in weight as possible and cubic contents kept to a minimum in order to economize shipping space, but the paramount consideration must always be safe handling. Brittle pine crates of ½-in. board are worthless.

"3. Packages over 1000 lb. or less than 200 lb. are to be avoided when practicable.

"4. Each case or crate should be firmly bound with strap or band iron. Straps should be not less than 1 in. wide and No. 18 gage. Ends should overlap at least 6 in.

"5. All lumber used in boxing and packing to be strictly sound and of such dimensions as to insure full protection under rough handling. Under no circumstances should outside boxing be less than 13/16 in. thick.

"6. Packages over 300 lb. should be packed in not less than 2-in. stock, additional straps and binding to be used at every 2½ in. for boxes exceeding 3 ft. in length.

"7. Boxes 600 lb. in weight, or over, shall have 4-in. by 4-in. skids, top and bottom of box, securely bolted together with ½-in. diameter bolts, and these bolts, wherever possible, should extend entirely through box. To prevent shifting, ends of box must be securely braced inside.

"8. Use yellow pine, gum, white pine, spruce and hemlock lumber surfaced on one or more sides. This gives a desirable uniformity of thickness and makes easy stenciling on more than one face of the package.

"9. Use cement-coated or barbed-wire nails—eight-penny and ten-penny. This is important to make the nails hold. Not less than two in end of any board and not over 4 in. apart in wide boards (6-in. boards, three nails).

"10. Use corner posts in all packages.

"11. Machinery itself should be covered with waterproofing paper or oilcloth to prevent damage from moisture. Machinery should be thoroughly slushed with suitable protective compound. All loose or detached parts should be firmly and securely fixed to prevent dislodgment during transit. All finished surfaces to be amply protected against injury from salt air and water.

"12. Packages containing machinery or parts should be securely blocked in the case or crate to prevent movement.

"13. Electrical and mechanical apparatus to be solidly packed, in excelsior, straw, salt hay or other filler, in a solid box with paneled ends, securely nailed, and then reinforced with ¾-in. by 3-in. battens around the sides at the ends, with 1-in. by No. 18-in. gage strap iron all the way around the battens, ends lapping at least 6 in.

"14. Hardware, nails, bolts, etc., because of their weight, should be packed in small cases or kegs.

"15. Materials such as glassware, tools, lamps, instruments, powder and acids shall be shipped in boxes, the thickness of stock to be determined by the weight or cubical capacity.

"16. Tools, instruments or any articles subject to damage by moisture shall be well wrapped in waterproof paper and boxes thoroughly lined with waterproof paper before being packed.

"17. Cylindrical articles, such as tanks, boilers, etc., shall be shipped in cradles made of heavy timbers, the articles to be securely bolted to cradles or skids.

"18. Oils, paints and liquids shall be shipped in 50-gal. barrels or steel drums of not less than No. 16 gage or in heavy tin containers which should be hermetically sealed and securely packed in boxes.

"19. On heavy boxes sling marks are to be plainly indicated on outside at the proper place, reinforcement being provided to insure against damage to case.

"20. All wide side pieces of flat packages should be prevented from splitting by cross-pieces nailed thereto—one in the middle for 6 ft. and two for sides over 6 ft.; band iron or corner clips to top and bottom should connect at these cross-pieces.

"21. If new packing is tried, test boxes and crates by forcibly pushing each over the end twice. The package is then dropped from a platform 3 ft. or 4 ft. high. The package must not be broken to any extent by this test.

"22. Projecting portions of heavy castings having narrow necks must be taken off, as they will break off by jarring.

"23. Gray-iron extended parts must be kept $\frac{1}{2}$ in. to 1 in. away from covering, as the spring of boards will cause breakage.

"24. Two heavy cast pieces must not rest together, but must be cushioned or separated by wood brace or block.

"25. In packing machines which are knocked down it is desirable to indicate, "Open on this side."

"26. Heavy items must be firmly bolted to skids or flooring; nothing shall be hung from sides of box. Unoccupied space in packing boxes must be thoroughly braced.

"27. Packages must sometimes be proportioned to facilities for handling at port.

"28. In marking packages use black waterproof marking or stencil paint.

"29. Put the following marks, in rectangle, on each separate box, crate, bundle or piece, unless otherwise instructed.

D. Req.....	F. Req.....
Order No.....	Pkg. No.....

"In addition to all marks hereinbefore specified, there is to appear on each package a synopsis of the contents of same, cubic contents, gross weight and by whom shipped.

"30. Packing lists must be made out correctly and in detail with all information called for. Merchandise must be described in specific terms. Such designations as 'Provisions,' 'Groceries,' 'Canned Goods,' 'Hardware,' 'Machinery,' or any other general terms, must not be used."

METAL MARKET SITUATION

Speculation Rife on the Future of Copper—Prices Reported Cut on Less than Car Lots

Discussion goes on whether the government price of 23.50 cents is equitable to both producers and industrial consumers of copper. Speculation runs along lines as to whether there is sufficient of the metal produced to satisfy governmental and commercial purposes. It is evident that the mining interests are disappointed in not obtaining a better price from the War Industries Board and are therefore still "bearing" the market when possible. On the other hand, there seems to be plenty of copper available. Possibly the official price is being observed in transactions covering car-load lots, but an authority states that there is a constant cutting of the government figure of 24.67½ cents for less than car lots.

The other metals are featureless, the same prices prevailing as last week, with tin scarce and none worth mentioning arriving either from China or the Straits.

NEW YORK METAL MARKET PRICES

THE WEEK IN TRADE

WITH government priority orders practically dominating every industry, the electrical goods line also feels their far-reaching effects. Manufacturers, distributors and jobbers are reported as having their customary methods of doing business greatly disturbed, in production and distribution, by the transportation tie-ups, embargoes, fuelless Mondays and other restrictions of a minor nature. Yet, in the face of these drawbacks, a steady demand for electrical goods of every description is in evidence. Trading, both wholesale and retail, is quite satisfactory, and in some sections heavier than ever. As yet no special difficulty is being encountered in obtaining goods beyond being subject to the embarrassing delivery delays.

A wider and more active market is commented upon for motors, circuit breakers, standard wiring devices, insulating and pole-line material, conduit, heating and general household appliances, vacuum cleaners, etc. Sellers, however, are rather reluctant to engage themselves very far ahead, even at the prevailing high prices. Advances on a few lines were lately made, and a higher level seems almost assured for electrical glassware of every description. Curtailment of iron and steel production in the last few weeks may also cause a more or less acute situation with the manufacturers of finished electrical merchandise wholly or in part of these metals.

Collections are variously stated as excellent, less prompt and fair, due to differing conditions. Credits, however, are held along firm lines.

NEW YORK

With large government contracts in the market for electrical goods, jobbers of the heaviest caliber are not inclined to jeopardize stock by bidding. It is figured that on some articles specified the quantities are so enormous that only manufacturers can safely handle them. Under these circumstances the plants would be completely tied up for months ahead. The first quantity of what is spoken of as the largest requirement on record, the details of which appeared on page 173 of the ELECTRICAL WORLD of Jan. 19, was urgently needed on or before Feb. 1.

Complaints regarding scarcity of labor for sufficient factory forces are heard, as well as of the restrictions placed on deliveries by the inadequate transportation facilities. Prices are generally mentioned as being at peak, but there are rumors afloat of still further advances in some lines.

Collections are from fair to good, and extensions of credits are being closely visé.

PORCELAIN.—The supply of porcelain goods is reported by jobbers only fair. The market has been strained, it is said, by government requisitions for 3,200,000 unglazed cleats, 24,000 knobs, 480,000 rosettes and 769,600 tubes.

FUSES.—Manufacturers are distributing literature descriptive of their goods and also furnishing the details of their sales policy for the year. No price changes have as yet been announced. One manufacturer, who expected to be in the market with a refillable fuse by now, states that on account of the difficulty and delay in making up tools for its production it will be fully six months before the line will be announced. Sales are said to be in good volume, one concern reporting that fuses are selling heavier than ever before. Some dealers complain that discounts on renewable fuses are too low.

SMALL MOTORS.—Deliveries are improving and can be made in four or five weeks if transportation is available.

FANS.—A representative fan manufacturer remarked this week that the distributors on his list had about all signed up for their 1918 requirements. The contracts so

far filed represented about 75 per cent of last year's commitments, he said, but as 1917 was an exceptional fan year, 1918's orders were, therefore, about normal. Another producer of equal prominence declared fans were selling in greater quantities for 1918 and that his company's contracts demonstrated this to be a fact.

CONDUIT.—Up to inch conduit the supply in this market is quoted as fair, and one jobber who has two cars in stock is referred to as being in a fortunate position. Conduit about one inch in diameter is difficult to obtain.

CIRCUIT BREAKERS.—The demand for large-capacity circuit breakers is reported as unusually heavy. Deliveries are from eight to ten weeks in arrears, solely dependent upon the release of cars. No advance in price has been made, a manufacturer of a diversified line says, since Dec. 1 last, when the list was only equalized on certain sizes.

LIGHTNING ARRESTERS.—A sharp call for lightning arresters was noted in the last few weeks. The government recently placed an order for 6000. Prices are stable, with shipments from stock.

HEATING APPLIANCES.—One local distributor did a business in January over twice that done in January, 1916. To a considerable extent this was due to sales of heaters and warming pads. The government is in the market for around \$100,000 of electric heaters and foot warmers. A large part of this order will be for stock.

CHICAGO

Since the first of the year the trade is getting more squarely on its feet. It sees the changed market conditions more clearly. Efforts that were formerly occupied in the building trades field are already shifted to the more profitable industrial plant and resale merchandise business. While the general wiring business is off, the retail trade was never better.

The leading group of electric shops in the city reports that its sales were better month by month in 1917 than in 1916, with the exception of July. The reason July fell below the previous year's record was not that July, 1917, was bad, but that July, 1916, was an exceptionally good fan month. Sales for January, 1918, were better than those of January, 1917, in spite of the fact that January, 1917, was a surprisingly good month.

CONDUIT.—In spite of the very low showing of electrical permits for the last few weeks the demand for conduit very greatly exceeds the supply. This is due probably to the fact that many of the industrial buyers of pipe are outside the city limits. It is said that while this week has been a breathing spell in the conduit field certain large industrial plants are known to be buying conduit in advance of requirements and putting it in stock for future use.

LAMPS.—The price increase has not affected the volume of lamp business. In making the increase of 10 per cent some unusual retail prices, such as 27.93 cents, were arrived at, but these details have been straightened out.

VACUUM CLEANERS.—The manufacturers are finding it easy to market all the machines they can make from the material they can secure. One cleaner has advanced \$10 in retail price and other increases are expected.

BOSTON

A perceptible falling off in trade is noted among jobbers and retailers, as was the case last week, but no permanent curtailment of business appears at all likely. From various quarters it is reported that the Monday shutdowns, which it is hoped will be eliminated throughout the East after this week, have had a bad effect on buying.

Contractors and dealers are on the whole overstocked with supplies at present. Collections continue rather slow, excepting from the larger central stations and from the mills. It is doubtful whether credits will show much improvement for the next month or so unless the smaller contractors get a chance to work off more of their stocks and to carry

through construction work of a more diversified character than is now on their books. Deliveries are very unsatisfactory, owing to railroad congestion and embargoes, but some manufacturers are beginning to improve their shipment dates through stock accumulation, notably in representative types of small alternating-current motors.

A 10 per cent advance in single-phase motors was put into effect in January by the Wagner Company, one of the last manufacturers to establish a recent increase. Appliance sales reflect a fairly healthy market condition. The opinion is advanced in some quarters that further price increases in electrical apparatus and supplies are quite within the bounds of probability during the next few months, though it is not expected that radical advances will take place at any one time. On the whole, the labor situation is reasonably quiet.

There is some hope of better electric railway conditions in Massachusetts at the present legislative session, ultimately leading to more general buying of supplies and equipment than has been practised for a long time.

MOTORS.—Local stocks are rather depleted, and their restoration depends to a very large extent upon the improvement possible in the railroad situation. Prices are firm, barring an advance noted above during the last month. Factory stocks of smaller motors are showing some improvement, but large units are still very scarce.

RADIATORS.—Sustained cold weather, high fuel cost and scarcity of coal are producing an unprecedented volume of business.

CONDUIT.—Prices show little change and stocks are about the same as last week. Until transportation conditions improve deliveries will continue very uncertain. Contractors are reported heavily stocked with the smaller fittings.

POLE-LINE HARDWARE.—Jobbers report this material to be very scarce. Deliveries are anything but satisfactory, on account of the railroad situation. One jobber looks for further price increases this spring.

LAMPS.—There is a prospect that orders of larger volume will be accepted after April 1 for bulk deliveries.

TELEGRAPH AND TELEPHONE MATERIAL.—Substantial sales of this equipment are being made for foreign service. Radio apparatus is in active demand for government use. There is a shortage of 2000 ordinary telegraph keys for New England service. Interior wire for telegraph work is easily obtained and is the first material to arrive on many plant construction jobs.

STORAGE BATTERIES.—An enormous volume of government business is being handled. Inquiries are very active for industrial truck batteries, and a recent price advance in battery equipment increased the corresponding truck price only 2 or 3 per cent. Much interest in trucks is shown by navy yards and arsenals.

ATLANTA

Dr. Garfield's latest interpretation of his fuel order as applied to industries served from hydroelectric sources has tended to clarify a very confusing situation in the Southeast. Almost all industrials using this form of energy operated through the five-day period, but a later announcement to the effect that all plants operating by hydroelectric power "are requested to shut down on Mondays" created a perplexing situation, and local fuel administrators for each state issued orders on the basis of their own construction, the outcome being that a number of plants continued to run while others shut down. From now on the various plants fortunate enough to have hydroelectric connections, and which can operate with sufficient fuel to keep pipes from freezing, can do so without feeling that their patriotism is questioned.

The rainfall has been abundant during this week and most of the streams have become swollen, which will materially help the hydroelectric companies, especially when they close down all auxiliary steam plants on Mondays. Generally speaking, the industries of this section are loaded with orders, principally for government account, and while the stoppage of work in some instances brought about by the fuel decree, in addition to effects of bad weather, curtailed

production and restricted trading in certain areas, a marked improvement is noted in the fuel situation and a more cheerful feeling in outlying districts.

The Brunswick (Ga.) Chamber of Commerce has been notified by a representative of the Emergency Fleet Corporation that at least 1000 houses will have to be erected at Brunswick within the next sixty days. It is also reported that these houses will be wired for electric lights. In this event a market will be opened for standard wiring devices. There is a noticeable falling off in the demand for heavy apparatus of late. This holds true as well with heavier cables, which have shown little activity except in scattered and isolated cases.

POLE AND LINE MATERIAL.—The demand for this line has been strengthened by telephone and telegraph requirements. A slight decrease in the call is noted from central stations. Hardware remains very active in the face of a 10 per cent increase in price in the last two weeks. Shipment promises are better and deliveries show marked improvement.

CROSS-ARMS.—An advance of 10 per cent was made Jan. 1, 1918. The heavy draft on this class of wood by the government for aeroplane work has, for the time, side-tracked and delayed shipments for normal industrial work, and the deliveries to this section have been slowed up materially.

INSULATING MATERIALS.—There has been a notable increase in the call for varnished cambric and mica insulators in the Southeast lately. Various repair shops report a large volume of work on hand. On the whole, deliveries are very good on insulation material, with the exception of a few special requirements.

SECOND-HAND EQUIPMENT.—Although a large quantity of this class of apparatus is being traded in, repaired and put in good shape, the pressure has lessened to some extent, and there is a tendency in certain sections to wait on shipments of new apparatus when other work cannot be completed in an equivalent time.

SEATTLE

Jobbers and dealers as a whole report that the volume of business in January exceeded by far that for any previous January in the history of the Northwest. Sales of household appliances, particularly of sewing and washing machines, equaled sales of December last year, which were large on account of the Christmas demand. Jobbers state that the sale of sewing machines is increasing daily and the Christmas record for washing machines is being sustained. Other household appliances are selling well, and the sale of flatirons is expected to increase materially within the next two months.

January did not experience the usual slow-up, which was a source of surprise and satisfaction. The present activity is expected to continue and increase throughout the year. The week's industrial business is featured by the awarding of several large ship contracts to the Northwest yards. Contracts have been awarded in Seattle for twenty-two cargo steamships, fourteen 8800-ton steel ships, costing \$20,000,000, and eight 4000-ton wooden vessels, costing \$7,000,000. These contracts bring the total number of ships building in Seattle to 135, the majority of which are direct federal contracts, and about three-fifths will be constructed and delivered during 1918. Authorities state that the shipbuilding industry in the Northwest is placed beyond the realm of uncertainty for the next two years by the substantial business already signed by various yards.

Owing to the recent freight embargo in the East box cars cannot be obtained for shipping conduit pipe, etc., to Pacific Coast jobbers who supply shipbuilding corporations. If the situation is not relieved or improved materially within two or three weeks, it may prove very serious. However, local jobbers believe that the matter will be adjusted before the situation becomes acute.

A new record for January building in Seattle was set last month, activity being confined almost exclusively to residences, factories and workshops. Permits for residences alone were issued to the value of over \$300,000. From pres-

ent indications the residence building records will be shattered in Seattle during the next two months. Residence building in Tacoma is progressing at a greater rate than at any time in the last five years. January broke all records. The high prices of materials and labor and the scarcity of both continue to restrict building in Portland, although a residence building boom is expected shortly. The proposed construction of numerous grain elevators in eastern Washington and Oregon will mean much to jobbers in sales of motors and other electrical equipment. During the past month the announcement of construction of at least fifteen, ranging in cost from \$25,000 to \$35,000, has been made.

Collections during January were fair. Government collections, particularly from the navy are slow. Very few new credits were placed, and applications are being scrutinized closely.

LINE MATERIAL.—Telephone equipment, including pole-line material, wire, cross-arms, insulators, etc., experienced a very satisfactory movement in the last two weeks. Several lucrative orders were placed for repairs and needed improvements. Wire stocks are ample, but there is a shortage of cross-arms and poles.

DYNAMOS AND TRANSFORMERS.—Motors, generators and transformers show a very satisfactory volume of sales. A Portland jobber landed an order of considerable size last week, and one or more large orders are in prospect.

SAN FRANCISCO

The foremost topic in discussing California business conditions and prospects just now is the drought. There has been some relief, but the situation is still very serious. In the central valleys, where the seasonal precipitation at this time averages 14 in., only 2½ in. has fallen this year, and even if the average rainfall of 9 in. occurs from now on, much of the unirrigated land will not produce. The land under irrigation systems will also suffer in that the supply of stored water will be very low. In the mountains, where the snowfall is usually more than 20 ft. by this time, only 2 ft. of snow has fallen, and the water stored for hydroelectric power will this year be very much below normal.

These conditions have affected the electrical trade already in that dealers are not placing the usual orders. However, that this is not the only angle from which to view California conditions is shown by the statement from one of San Francisco's large electrical jobbing firms that the last month has been the best in volume of trade for several years. Moreover, a further analysis of that trade indicates that it consisted of purchases whose average value was less than normal. This refutes the claim that the only heavy business comes from large government or industrial orders.

CREDITS AND COLLECTIONS.—Collections are exceptionally good for this time of year and apparently are not suffering under war conditions. Credits are being extended about as usual.

WIRE.—Stocks are in poor shape and deliveries slow. Little improvement can be hoped for.

SAFETY SWITCHES.—Stocks are greatly improved in this line, partly because of the change in recent months from building to industrial construction.

STORAGE BATTERIES.—The sales in January in this line, one manufacturer reports, were about 25 per cent more than in the corresponding month a year ago. The industrial and gasoline-engine manufacturing fields have been very active, supplementing the steady demand for automobiles.

MOTORS.—The irrigation demand continues unusually heavy, and manufacturers are handling the situation very well, being materially aided in this by the Priority Board. It is noted that the demand for transformers from agricultural districts has not been so heavy as would be indicated by the motor business, but this is largely because service is supplied by power companies at voltage suitable for customers' motors.

WIRELESS SUPPLIES.—An even greater demand than before the war is noted in some lines of wireless specialties. Buzzer sets for government schools and equipment for instruction generally have gained large volume.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements
in Manufacturers' Products Used in
the Electrical Field

The New Features of 1918 Fan Designs

CHANGES in the line of fans offered to the trade for 1918 consist almost entirely of the elimination of those types that have been in less demand and which have been discontinued with a view to concentrating manufacturing effort and available supplies of materials on the types of fans most needed. Few new fans will be placed on

HAMILTON-BEACH FAN EQUIPPED WITH
AIR-COOLED MOTOR

the market this year. Virtually all six-blade fans have been replaced by the four-blade type except in the larger alternating-current oscillatory fans. The absence of speed controllers, highly polished parts and other refinements not necessary for reliability is noteworthy. The more important changes in design follow:

Carleton Company, Boston, Mass.—This company will continue to specialize in battery fans of any voltage. This year, except on oscillating fans, a universal ball-and-socket joint will be used instead of the regular hinged joint.

Century Electric Company, St. Louis, Mo.—Minor improvements have been made in several of this company's models, but these changes are not sufficient to change the general appearance. This company's 9-in. (22.9-cm.) fans, which were described in the Jan. 27, 1917, issue of the *ELECTRICAL WORLD*, were not produced in a large quantity and will be featured this season.

Emerson Electric Manufacturing Company, St. Louis, Mo.—This company has discontinued the non-oscillating six-blade residence-type fan for alternating current and direct current, the six-blade direct-current oscillators, the 32-in. (81.3-cm.) sweep ornamental-type oxidized-copper-finish ceiling fan, and all of the ornamental-type ceiling fans previously offered with chain suspension. Six-blade residence-type fans will be made for 1918 in 12-in. and 16-in. (30.5-cm. and 40.6-cm.) alternating-current oscillating types only. A line of new model duplex rotary ceiling and column fans is listed for 1918, designed with careful consideration of the ex-

perience gained in the manufacture of these fans last season, it is said. This company's four-blade, 52-in. (132.1-cm.) sweep oxidized-copper-finish ornamental-type ceiling fan has been replaced by a new type, No. 42,641, equipped with 56-in. (142.2-cm.) sweep blades.

General Electric Company, Schenectady, N. Y.—One novel departure of this company's fans is in the finish, as all metal parts are now enameled a dark green and the blades are lacquered brass. All of these fans are readily adjustable for either desk or bracket use. They are furnished with standard cords and plugs.

The complete line of General Electric Company's fans for this season will include 9-in., 12-in. and 16-in. (22.9-cm., 30.5-cm., and 40.6-cm.) oscillating and non-oscillating four-blade fans in both direct and alternating current. Six-

WESTINGHOUSE FAN FROM WHICH USUAL
REFINEMENTS HAVE BEEN OMITTED

blade oscillating fans in 12-in. and 16-in. sizes are made for alternating current only.

Ventilating fans for 1918 will be handled in 12-in. and 16-in. sizes, six blades, in both alternating current and direct current. These fans, finished in green enamel, with lacquered brass blades and trimmings can also be furnished with special bearings to operate in a vertical position.

In standardizing to three sizes of desk and ceiling fans the company's engineers feel that they have provided a fan suitable for every use.

A. C. Gilbert Company, New Haven, Conn.—Several mechanical changes have been made in the Polar Cub fan made by this company. The speed-con-

trol handle, which was found to be too long, has been shortened, the motor is nickel-plated and the guard and blades are finished in black japan. This company has added a 9-in. (22.9-cm.) oscillating, four-blade fan, equipped with a universal motor, to its line.

Hamilton-Beach Manufacturing Company, Racine, Wis.—This company announces its Cyclone universal fan, equipped with the H-B universal air-cooled motor, wound to operate on both direct and alternating current at a voltage of from 105 to 120, 60 cycles. This fan is equipped with a rheostat speed control giving five different speeds and shut-off. It has an extra-heavy base which effectually prevents its creeping, and its design readily permits of its use either as a desk or wall-bracket type.

Knapp Electric & Novelty Company, New York City.—This company has added a new fuse to its line, an 8-in. (20.3-cm.) 110-volt fan equipped with a universal motor. The fan is finished in brass and black japan and equipped with 6 ft. (1.8 m.) of cord and plug. Only minor changes have been made in the fans that were marketed last year.

Menominee Electric Manufacturing Company, Menominee, Mich.—This company makes the announcement that its 1918 fan-motor line will not include any radical changes or any entirely new models. It has discontinued temporarily a few of the special patented types, such as the horizon-

WESTERN ELECTRIC 6-IN. FAN

tal table fan and socket fan, which were principally for the foreign market. It is announced that this company's type 150 8-in. (20.3-cm.) universal straight-type low-priced fan can be had this year with or without a three-speed

rheostat in the base. When without, the fan retains the usual type number of 150, but with the three-speed rheostat in the base the type number is 164. The 8-in. (20.2-cm.) oscillator has been redesigned, substituting die casting for

CARLETON FAN EQUIPPED WITH UNIVERSAL BALL-AND-SOCKET JOINT

cast iron. On the 12-in. and 16-in. (30.5-cm. and 40.6-cm.) types the brass guard holders are being omitted. Both guards and guard holders will be black enameled steel, and, as usual, the blades will be of polished brass.

Pittsburgh Electric Specialties Company, New York City.—This company has brought out an improved 8-in. and 10-in. (20.3-cm. and 25.4-cm.) fan of the oscillating type that is finished in black japan with brass blades, adjustable for desk or wall use. These fans have three speed regulations and may be used either as straight or oscillating fans. They are equipped with cord and plug and universal motor.

Sprague Electric Works of General Electric Company, New York City.—Aside from improvements in minor details of construction, the only change made in this company's fan-motor line is the substitution of a blade finished in brass lacquer on its 12-in. and 16-in. (30.5-cm. and 40.6-cm.) fans for the blade finished in black enamel which was used last season. The guard, as well as the motor body and base, will continue to be finished in black enamel.

Western Electric Company, New York City.—The specifications for this company's line for the coming season conform in most particulars to those of the 1917 line, the most noteworthy change being the finish of its 6-in. (15.2-cm.) fan, which will be dark green. As standard for 1918, a 6-in. fan to be operated only on alternating-current circuits and another to operate only on direct-current circuits will be marketed.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.—Concentration on those models whose serviceability and popularity have been amply tested has been the aim of the 1918 changes in the line of fans made by the Westinghouse Electric & Manufacturing Company. Where both four-blade and six-blade fans have been offered the six-blade fans have been eliminated and some of the less popular ceiling fans have been withdrawn.

All portable fans are provided with

a hinge joint to adapt them to mounting on either desk or wall. The oscillating mechanism can be adjusted for a "swing" of from 45 deg. to 90 deg. at the rate of eight per minute, or can be locked out of service entirely. A tilt of 20 deg. from horizontal can also be had.

The Westinghouse Whirlwind, an 8-in. (20.3-cm.) fan at a popular price, has the drawn-steel construction characteristic of Westinghouse fans. From it have been omitted, however, such refinements as speed control, highly polished blades and others not necessary for durability. Current can be cut off by separating the attachment plug.

The remainder of the portable line includes both oscillating and non-oscillating fans of 10, 12 and 16-in. (25.4, 30.4 and 40.6-cm.) diameters. Ten-inch fans have zinc-plated, polished and lacquered blades; 12-in. and 16-in. models have polished and lacquered brass blades. The finish of all other parts is dull black. All models are packed in substantial boxes and include attachment plug and 8 ft. (2.4 m.) of cord.

MENOMINEE FAN WITHOUT RHEOSTAT IN BASE

Reports from the Other Manufacturers.—The following manufacturers report only slight changes in fans for the coming season: Dilg Manufacturing & Trading Company, New York City; H. Boker & Company, Inc., New York City; Fidelity Electric Company, Lancaster, Pa.; Manhattan Electrical Supply Company, Inc., New York City; Crocker-Wheeler Company, Ampere, N. J.; Eck Dynamo & Motor Company, Belleville, N. J.; Star Electric Motor Company, Newark, N. J.; Racine Universal Motor Company, Chicago, Ill.; Robbins & Myers Company, Springfield, Ohio; Adams-Bagnall Electric Company, Cleveland, Ohio; Lindstrom-Smith Company, Chicago, Ill., and Hunter Fan & Motor Company, New York City. The Shedd Electric Company, Inc., of Roselle Park, N. J., announce that it does not expect to manufacture any fans this season.

The Peerless Electric Company, Warren, Ohio; Crucet Manufacturing Company, New York City; Dayton Fan & Motor Company, Dayton, Ohio; American Electric Fan Company, Logansport, Ind.; Kokomo Oscillating Fan Company, Kokomo, Ind., and Russell Electric Company, Chicago, Ill., have made developments in fans which are not available at this time, but will be described in later issues of the ELECTRICAL WORLD.

Electric Tractor

Electric tractors that are especially valuable for haulage between buildings of large manufacturing plants and similar places are made by the Walker Vehicle Company of Chicago. Tractors are made with hauling capacities up to 15 tons gross trailing load, the one shown here having a hauling capac-

VALUABLE FOR HAULAGE IN MANUFACTURING PLANTS

ity of 10 tons. It is pointed out that the large-diameter wheels of these tractors make them especially valuable on rough pavements. The Walker balance drive used in these tractors is extremely simple, durable and efficient, it is said. A sixty-cell Edison type A-12 battery is used.

Concrete Lighting Posts

The accompanying illustrations represent a part of the line of concrete posts for lighting boulevards, streets and parks made by the Chicago Concrete Post Company of Chicago. All of these are ornamental in appearance, pleasing in design and made to withstand severe and varying climatic conditions. It is said that these posts are not affected by either the heat of summer or the cold and ice of winter. The post heights are from 8 ft. to 13 ft. (2.4 m. to 4 m.), exclusive of globe holder.

The posts are one solid shaft, made in water-tight cast-iron molds, and are

THREE TYPES OF CONCRETE POSTS

each reinforced with four twisted "rail carbon" steel rods. The reinforcing rods extend about 18 in. (45.7 cm.) below the base of the post, and by inserting rods in the foundation the use of anchor bolts is eliminated.

Trade Notes

M. A. B. STEIN has resigned as New England representative of Harvey Hubbell, Inc., to take up work in the contentment division of the Quartermaster's Department of the army at Washington.

THE CROCKER-WHEELER COMPANY of Amherst, N. J., announces that Ben D. Christian and D. B. Graze will hereafter represent it on the selling staff at Cleveland, Ohio, succeeding Howard Dingle and W. W. Clark.

THE STANDARD ELECTRIC & ELECTRIC COMPANY, Inc., of Baltimore, Md., has been reorganized and is offering \$100,000 of 7 per cent cumulative preference stock for public subscription. The money realized through this stock issue is to be applied to the development of the company's physical facilities necessary to present demands.

THE WAR TRADE BOARD, Washington, D. C., in an official announcement, states that henceforth a new export application form will be used in place of all forms hitherto in existence. It will be the only application form in use. Copies of the blanks, with information pertaining to their use and other pertinent directions, may be had on application to the board.

THE DAYTON ENGINEERING LABORATORIES COMPANY of Dayton, Ohio, is now occupying its new buildings, greatly facilitating the output of Delco-light products. In all there are 135,000 sq. ft. of floor space. The three buildings are single-story structures of the monitor type, thus insuring uniform lighting and ventilation. The general offices of the company remain at the old address.

THE GENERAL ELECTRIC COMPANY, Harrison, N. J., has commenced the erection of a large new plant on Cross Street for the manufacture of glass bulbs, and the work is progressing favorably. The company is also planning for the erection of an addition and alterations at its plant at 268 North Nineteenth Street, East Orange, and has taken out a building permit for this purpose.

THE NATIONAL ASSOCIATION OF MANUFACTURERS of New York City, through its foreign department, has published an interesting pamphlet entitled "An Export Order," with a description of an effective agency for promoting the foreign trade of American manufacturers. Various approved forms of correspondence, invoices, packages, etc., are embodied. Copies may be obtained by writing.

H. W. STORTZ, for many years with the Edison Storage Battery Company, Orange, N. J., during which he served as sales manager of the mine lamp department, sales manager of the industrial truck and tractor department and sales manager of the house-lighting department, has resigned to become vice-president and general sales manager of the Swartz Electric Company of Indianapolis, Ind., manufacturer of automatic lighting plants.

THE MECHANICS AND METALS NATIONAL BANK of New York City has prepared a booklet, which is being sent to banks and business organizations throughout the country, outlining a plan for converting non-essential industries of the nation to a war basis on a gradual instead of a drastic scale. It is entitled "Steps to Victory" and described as a "brief discussion of the things to do and the things to do without during the progress of the war."

THE MAXWELL ENGINEERING & MANUFACTURING COMPANY of New York City succeeds to the business of Hickey & Schneider, dissolved, manufacturers of electrical specialties, transmission line equipment, transmission line hardware and outdoor and indoor substations. The new company is established at 61 Broadway. Mr. Maxwell, president and general manager of the company, was for the past five years sales agent for the H. & S. line.

THE IRVING NATIONAL BANK of New York City has published several pamphlets written by Lewis E. Pierson, chairman of the board of directors, entitled respectively "The Trade Acceptance Nationally Launched," "Government Price Fixing and Profit Taxation" and "War Time Finance." A fourth pamphlet, "The Influence of the War on Trade, Domestic and Foreign," is by G. A. O'Reilly, the bank's foreign trade representative. Copies may be had by application.

THE ELECTRICAL ENGINEERS' EQUIPMENT COMPANY of Chicago announces the removal of its general offices and a portion of the manufacturing departments to 710-714 West Madison Street.

This new location is directly opposite the company's present quarters, at 711-715 West Madison Street. The major portion of the factory proper, together with the shipping and stock departments, will remain at the latter address, which is connected to the Madison Street building by means of a runway.

THE PATTON-MACGUYER COMPANY, Providence, R. I., is the new corporation name of what was formerly the Bliss-Chester Company, manufacturer of brass stampings, of that city. The location and nature of the business will be substantially the same as before. The executive officers are: Ralph C. Patton, president; Charles L. Patton, vice-president, and Herman F. MacGuyer, secretary and treasurer. R. C. Patton was formerly chief engineer of the D & W Fuse Company, Providence, R. I., and Mr. MacGuyer special sales representative.

THE DRIVER-HARRIS COMPANY, Harrison, N. J., had a fire in its factory last week, which destroyed two of the buildings used for storage of raw materials and finished stock, machinery, chemical laboratory, testing room, one of the shipping rooms and one of the wire-spooling departments and the electrical cord and wiring insulating department. Suspension in shipment of materials affected by this fire, the company states, will only be temporary. More than half of the machinery required for electrical cord production and other required new equipment has been purchased and is now on the way to the factory. Temporary quarters have been provided.

New Incorporations

THE BUNYAN SIGNAL LIGHT COMPANY of Cleveland, Ohio, has been chartered with a capital stock of \$20,000 by W. J. Bunyan and Andrew Heppel.

THE STANDARD WIRE COMPANY of Harrison, N. J., has been incorporated with a capital stock of \$50,000 to manufacture wire for electrical and other service.

THE ELECTRICAL ENGINEERING COMPANY of Pittsburgh, Pa., has been incorporated with a capital stock of \$30,000 by Thomas G. Hodgson and others.

THE JERSEY CITY (N. J.) AUTO ELECTRIC COMPANY has been organized to operate an electrical repair plant at 279½ Fairmount Avenue. R. Kaiser is one of the incorporators.

THE FRANCO BATTERY COMPANY of St. Mary's, Pa., has been incorporated with a capital stock of \$250,000 by Lyle G. Hall and others. The company proposes to manufacture electric batteries.

THE AUTOMATIC RAILWAY COMPANY of New York, N. Y., has been chartered with a capital stock of \$14,500 by L. H. Washburn, C. K. Allen and J. S. Wooster, 115 Broadway, New York City.

THE ELECTRICAL ENGINEERING COMPANY of Pittsburgh, Pa., has been chartered with a capital stock of \$30,000 by Thomas G. Hodgson. The company proposes to do a general engineering business.

THE ELECTRIC APPLIANCE COMPANY of Pittsburgh, Pa., has been incorporated with a capital stock of \$25,000 to manufacture electrical appliances. The incorporators are A. A. Meagher and others.

THE HARRIS POPP ELECTRIC COMPANY of Charleston, W. Va., has been chartered by A. Norroff, T. H. and Thomas Popp. The company is capitalized at \$10,000 and proposes to manufacture electric fixtures.

MARCUS & COMPANY of Boston, Mass., has been incorporated by Israel H. Marcus, Edward A. Thomas of Winthrop and Daniel F. Cunningham of Brighton. The company is capitalized at \$50,000 and proposes to deal in electrical supplies.

THE RURAL LIGHT & POWER COMPANY of Louisville, Ky., has been incorporated with a capital stock of \$15,000 by W. R. Katterjohn, A. H. and R. M. Thompson. The company proposes to install and operate electric-lighting and power plants.

THE ASHLAND (ME.) ELECTRIC COMPANY has been incorporated by G. H. Mooers, L. C. Mooers and W. L. Waldron of Ashland. The company is capitalized at \$50,000 and proposes to generate and distribute electricity for lamps and motors.

THE DOMESTIC ELECTRIC EXPORT COMPANY of New York, N. Y., has been incorporated with a capital stock of \$200,000 to do a general import and export business and deal in manufactured articles. The incorporators are A. H. Gleason, J. J. Hayden and D. Barnett, 258 Broadway.

Trade Publications

PIPE PUSHER.—The Easy Manufacturing Company of David City, Neb., is distributing a bulletin descriptive of its "Easy" pipe pusher.

FLUSH RECEPTACLE.—Harvey Hubbell, Inc., of Bridgeport, Conn., is distributing bulletin 16-3, descriptive of its Hubbell flush receptacle with adjustable aligning plate.

FANS.—The Knapp Electric & Novelty Company, 511 West Fifty-first Street, New York City, has prepared a leaflet descriptive of its fans for 110-volt and battery service.

INSTRUMENT TRANSFORMERS.—Bulletin 46,013, descriptive of switchboard-type instrument transformers, is being distributed by the General Electric Company of Schenectady, N. Y.

AUTOMATIC RAILWAY SUBSTATIONS.—The Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., has prepared leaflet 3998, descriptive of its automatic railway substations.

INDUSTRIAL TRUCKS AND TRACTORS.—Electric storage battery industrial trucks and tractors are illustrated and described in catalog No. 117 prepared by the Elwell-Parker Electric Company of Cleveland, Ohio.

CONVEYOR.—The Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has just issued an eight-page booklet (known as booklet W) illustrating and describing the C-H dispatch conveyor, which is particularly adapted for newspaper and magazine publishing plants. It is designed for taking papers from the press (regardless of the press speed) and delivering the folded papers in the mailing room. The booklet also gives a list of representative papers using the conveyor. The flexibility of this dispatch conveyor permits turning at any angle, vertical or horizontal, to avoid obstructions. It may be run overhead, down through the floor or straight away.

RESISTANCE MATERIAL.—The Electrical Alloy Company, 135 Broadway, New York City, has just issued its new edition bulletin catalog No. 9, which contains much useful information on its complete line of electrical resistance materials, nickel alloys, pure nickel and electrical alloy grade "A" monel metal. The book will be of extreme interest to all engineers, and particularly to those in the electrical and automobile industries. It is pointed out by the Electrical Alloy Company in its catalog that each electrical alloy product has been standardized only after repeated and exhaustive tests by its staff of electrical and metallurgical engineers, and also that its complete line embodies a resistance material for each resistance requirement.

BAKELITE MICARTA GEARS.—Technical information regarding Bakelite Micarta-D gears is contained in a pamphlet recently published by the Westinghouse Electric & Manufacturing Company of East Pittsburgh. The distinctive features of this material for noiseless gears and pinions are listed, together with its physical properties. Methods of turning and drilling and gear cutting are described and illustrated with many halftones and drawings. Methods of attaching to the driving shaft which have proved suitable for gear of all sizes are shown and tables of pitch, teeth and other gear data are also given. There are formulas for the horsepower rating, the amount of power which can be transmitted through press fit and for calculating other variables in gear practices.

METERS.—Users of gas in large quantities, such as steel mills, gas companies and others, will be interested in knowing that the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has just issued an eight-page booklet (known as booklet T) illustrating and describing the Thomas meter for the accurate commercial measurement of gases and air in large quantities. The booklet gives the principle of operation, illustrates essential parts and shows typical installations. The Thomas meter is different from all other forms of gas meters capable of measuring large quantities of gas in that it gives the quantities in standard units by which gas is bought and sold and does not require any corrections for temperature or pressure. Further, it shows a totalized result on an integrating meter and a graphic record of the rate of flow on a curve-drawing meter. The Thomas meter uses electricity as a means for measuring the quantity of gas and is a desirable load for the electric light company because under usual operating conditions it will have a high load factor and practically unity power factor.

New England States

BATH, ME.—The trustees of the Bath water district are considering the advisability of equipping the pumping station in Woolwich with electrically-operated machinery to replace the present steam power plant.

ASHLAND, N. H.—Improvements are being made to the municipal electric-light plant, including the installation of a 200-kw., three-phase, 60-cycle, 2300-volt Westinghouse turbo-generator set, and thirty-five 400-cp. luxolite lamps. L. G. Field is manager of power station.

BOSTON, MASS.—Bids will be received by the schoolhouse commissioners of the city of Boston, 1007 City Hall Annex, Boston, until Feb. 12 for construction of an elementary school, complete, in Roger Wolcott District, Harvard Street, Dorchester. A complete set of plans and specifications may be obtained upon a deposit of \$25. A deposit of \$15 will be required for a set of heating and ventilating or electrical plans with specifications.

GLOUCESTER, MASS.—The Council has granted the Gloucester Electric Company permission to erect pole lines on Winchester, Court, Warner and Burnham Streets in order to supply additional energy to the munitions plant, and also to provide more power to contemplated industries in the Maplewood section.

PALMER, MASS.—The Central Massachusetts Electric Company has petitioned the State Gas and Electric Light Commission for approval of an issue of additional capital stock of \$200,000, the proceeds to be used to pay the cost of additions to its plant.

PROVIDENCE, R. I.—The Queen Dyeing Company, Valley Street, has awarded contract for the construction of a two-story addition to its power house, to cost about \$7,000.

MERIDEN, CONN.—The Meriden Electric Light Company will install a 3000-kva. Westinghouse steam turbine in April for which necessary construction has been completed. Herman Minkwitz is superintendent.

Middle Atlantic States

BROOKLYN, N. Y.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., to the Marble Architecture Company, Broadway and 216th Street, New York City, for the construction of the proposed new power house at the local navy yard, to cost \$225,000.

BUFFALO, N. Y.—The Public Service Commission has given its approval to the application of the Niagara, Lockport & Ontario Power Company to take over and operate the Salmon River Company.

BUFFALO, N. Y.—Plans have been prepared by the Sizer Forge Company, 238 Larkin Street, Buffalo, for several new buildings, including a machine shop, covered yard and machine and forge-shop in one group, to cost \$112,000; brick forge-shop, \$45,000; heat-treating plant, \$87,000, and a three-story office building, to cost about \$80,000. Plans for additional buildings to represent a total investment of \$1,000,000, including the above, are under consideration by the company.

GLOVERSVILLE, N. Y.—Plans are being prepared by McKenzie, Voorhees & Gmelin, 1123 Broadway, New York City, for the construction of a new telephone exchange building, 30 ft. by 40 ft., for the Glenn Telephone Company.

ILION, N. Y.—The entire municipal electric-lighting system is being rebuilt. The work is now about half done. The work, it is expected, will be finished in about two years. C. S. Daily is manager.

MEDINA, N. Y.—The Western New York Utilities Company is contemplating the construction of a storage dam. G. W. Ide is superintendent.

NEW YORK, N. Y.—The United Electric Light & Power Company is constructing a condensing water intake tunnel connecting Harlem River with its generating station now under construction. During 1918 one 22,000-kw. turbo-generator unit, three-phase, 62½ cycles, 8000 volts, will be installed. L. A. Coleman is assistant secretary.

TULLY, N. Y.—Work is nearly completed on the installation of the new street-lighting system. Series 6.6-amp. lamps are being substituted for arc lamps. Louis C. Clay is chief engineer.

RAYONNE, N. J.—The New York Telephone Company is contemplating the construction of a one-story cable house on First Street, near Lord Avenue, for which permit has been granted.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

KEARNY, N. J.—Extensions and improvements to the electric fire-alarm system are under consideration by the Town Council.

NEWARK, N. J.—The Board of Freeholders has rescinded its contract for electric and power wiring in the laundry at the Essex County Hospital at Overbrook, recently awarded to the Beaver Engineering Company of Newark, at \$14,174.

PLAINFIELD, N. J.—Steps will soon be taken by the board of governors of Muhlenberg Hospital for the installation of an electric plant in the hospital, to cost about \$8,500.

TRENTON, N. J.—The State House Commission has announced that the construction of the proposed new electric plant at the New Jersey State Hospital has been temporarily postponed, due to the high cost of material, etc. The cost of the plant is estimated at \$50,000.

WEST ORANGE, N. J.—The Town Council has approved an appropriation of \$26,000 (in the annual budget) for electric street-lighting purposes.

DU BOIS, PA.—The Du Bois Electric & Traction Company has filed a notice with the Public Service Commission of an increase in capital stock of \$49,000, the proceeds to be used for improvements, etc.

EMAUS, PA.—A number of important public improvements were recommended by Burgess Knauss in his annual message to the Council, including an ornamental lighting system, an improved fire-alarm system, street improvements, etc.

ERIE, PA.—Contract has been awarded by the Erie Forge Company, Fifteenth and Cascade Streets, for the construction of a new substation, about 50 ft. by 70 ft., to the Stader-Conrath Company of Erie.

LEWISTOWN, PA.—The Lewistown & Reedsville Electric Railway Company has filed notice with the Public Service Commission of an issue of \$68,000 in bonds, to provide for extensions, improvements, etc.

PHILADELPHIA, PA.—Plans are being considered by the City Water Bureau for the erection of a new hydroelectric power plant at Fairmount. It is proposed to build a large dam in connection with the new power station.

SCRANTON, PA.—The Scranton Electric Company has purchased the plant and holdings of the Jenkins Township Light, Heat & Power Company.

BALTIMORE, MD.—A permit has been granted to the Consolidated Gas, Electric Light & Power Company to erect a power house, 60 ft. by 90 ft., at 25 Custom House Avenue, to cost about \$65,000.

BALTIMORE, MD.—Plans have been filed and contract awarded by the Crown Electric Company, 149 North Gay Street, to L. Schoenlein, Jr., Guenther Building, Baltimore, for the erection of a two-story addition, 25 ft. by 80 ft., to its plant.

HAGERSTOWN, MD.—The Federal Milling & Refrigerating Company, recently incorporated with a capital stock of \$300,000, is planning to install an ice plant. Electricity will be used as motive power. Orders, it is understood, have been placed for equipment.

SECURITY, MD.—The Hagerstown & Frederick Railway Company is now installing a 6250-kva. turbine at its Security station. M. A. Pooler is general manager.

BRISTOL, VA.—Plans are under consideration by the trustees of King College for the construction of a new power house, to cost about \$30,000. C. B. Kearfoot of Bristol is architect.

NORFOLK, VA.—Plans have been prepared by the Packers' Architectural & Engineering Company of Chicago, Ill., and Wilson & Sompayrac, associated architects and engineers, Columbia, S. C., for constructing and equipping a cold storage plant on the water front for the Seaboard Ice & Cold Storage Company, consisting of main building, 400 ft. by 250 ft., 15 stories high; electric traveling cranes, eight elevators, dry storage building, 300 ft. by 72 ft., and power house, 96 ft. by 66 ft. The plant will be equipped for general cold storage and fish freezing. The cost of the plant is estimated at \$1,899,000. Louis Feuerstein is president.

ROANOKE, VA.—John B. Guernsey & Company of Roanoke, it is reported, contemplate the construction of an electric

plant for a mining camp at Rellim Sid-ing, Va.

WASHINGTON, D. C.—The Bureau of Yards and Docks, Navy Department, has awarded contract for the installation of an electric-lighting system in the gun shop at the local navy yard to the White City Electric Company, 721 Ninth Street, N. W., Washington, at \$12,900.

WASHINGTON, D. C.—The Bureau of Yards and Docks, Navy Department, has awarded to the Penn Seaboard Steel Corporation, Franklin Building, Pa., a contract for the installation of a 3000-kw. turbo-generator set at the navy yard, to cost about \$56,385.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25 for furnishing traveling cranes for the Washington Navy Yard, under specifications 2775. The cost is estimated at \$600,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 18 for furnishing and installing ten electrically-driven capstans at the navy yards at Norfolk, Va., and Philadelphia, Pa. Drawings and specifications (No. 2786) may be obtained upon application to the above bureau or to the commandants of the navy yards named.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 18 for fuel-oil heater, feed-water heaters, flow meters, tanks, reversing well equipment, coal gates, coal weighers, induced-draft fans, carbon-dioxide recorders and miscellaneous equipment at the navy yards, Norfolk, Va., and Philadelphia, Pa. Drawings and specifications (No. 2760) may be obtained on application to the above bureau or to the commandants of the navy yards named.

North Central States

CHARLEVOIX, MICH.—The city of Charlevoix has leased the plant of the Hydraulic Power & Light Company at Bellaire and contemplates installing a 200-hp. water wheel, one 350-hp. Skinner engine, one 500-hp. Corliss engine, one 200-hp. and one 300-hp. Stirling boiler; for auxiliary one 350-kv. Bullock, three-phase, 60-cycle, 2200-volt generator, and the erection of 28 miles of 23,000-volt transmission line. An auxiliary unit, consisting of a 120-hp. oil engine and a Westinghouse 90-kw., 2200-volt generator, is being installed at the Charlevoix plant. A. J. Hamilton is superintendent.

FLINT, MICH.—The local plant of the Commonwealth Power Company was recently damaged by fire, causing a loss of about \$20,000.

CHARDON, OHIO.—At an election held Dec. 2 bonds to the amount of \$25,000 were voted to rebuild and improve the municipal electric-light plant. It is proposed to change the system from 133 to 60 cycles and establish a day service and also to install a new electric-generating unit. Provision will be made to pump the city water as soon as installed, for which a \$58,000 bond issue has been authorized.

LORAIN, OHIO.—Part of the plant of the H. Koppers Company of Lorain, including the machine shop, electrical department, tool room, etc., was recently destroyed by fire.

TOLEDO, OHIO.—The Acme Power Company, which is erecting a large power plant on the East Side, has increased its capital stock from \$500,000 to \$3,200,000. The plant, it is expected, will be placed in operation in the near future. The initial unit will have a generating capacity of 60,000 hp.

WELLINGTON, OHIO.—The Board of Trustees of Public Affairs is in the market for a flywheel of the following dimensions: 40 in. to 48 in. by 10 in. to 14 in., by 6-in. or 6½-in. bore, to weigh approximately 1000 lb. C. E. Gadfield is superintendent.

JACKSON, KY.—Preparations, it is reported, are being made by the Jackson Light & Ice Company to rebuild its electric plant, recently destroyed by fire.

LOUISVILLE, KY.—The Roy C. Whayne Supply Company of Louisville, it is reported, is in the market for single and double drum electrically-operated hoists, either for three-phase, 60-cycles, alternating current or for 220 to 250 volts direct current, and also for two and three-drum hoists, 7 in. by 10 in. or larger.

MAYFIELD, KY.—Bonds to the amount of \$272,000 have been authorized for the purpose of taking over the water and lighting plants of the Mayfield Water & Light Company.

NEWPORT, KY.—Bids will be received by the Artisan Oil & Gas Company, Wool-sack Building, Newport, until March 1 for pumping machinery to operate 3½ miles of 3 in. oil pipe lines.

OWENSBORO, KY.—A new 1875-kva. Westinghouse two-phase, 60-cycle, 2400-volt steam turbine is being installed in the municipal electric-light plant. William Watson is superintendent and chief engineer of the municipal electric plant.

INDIANAPOLIS, IND.—The Board of County Commissioners has signed a contract with the Merchants' Light & Heat Company of Indianapolis for supplying light and heat for the various county buildings for the year 1918.

MONTREY, IND.—Plans are being prepared by Carl Nielsen, 154 West Randolph Street, Chicago, Ill., for the construction of a new power house, 50 ft. by 125 ft., one-story and basement, for the Monterey Electric Light & Power Company.

SCOTT, IND.—The town of Scottsburg is now installing a new system to supply electricity for commercial purposes.

WILLIAMSPORT, IND.—Improvements are contemplated to the municipal electric-light plant, including the installation of a three-phase generating unit (directly connected) to replace the single-phase unit now in use. A new switchboard is now being installed. R. B. Rodman is superintendent.

AURORA, ILL.—The Illinois Public Utilities Commission has granted the Western United Gas & Electric Company permission to issue \$180,000 in bonds.

CANTON, ILL.—Application has been made to the State Utilities Commission by the Canton Gas & Electric Company for authority to erect high-tension transmission lines. William H. Parlin is president.

HARTFORD, WIS.—The purchase of a 500-hp. water tube boiler to supplement the three boilers (total capacity 450 hp.) in the municipal electric-light and power plant is under consideration. The present boiler house will also be enlarged. Definite plans have not yet been decided upon.

LOWELL, WIS.—The Lowell Light & Power Company is planning the erection of 8 miles of electric transmission lines, work on which will begin in the spring. Webster F. Pease is manager.

MILWAUKEE, WIS.—The Milwaukee Electric Railway & Light Company contemplates extending its lines a distance of about 5 miles.

DULUTH, MINN.—The Duluth Edison Electric Company is completing the installation of two-phase and three-phase feeder-panel addition to switchboard and the installation of five additional single-phase feeder regulators, making 14 in service. C. W. Higgins is assistant manager and chief engineer.

PINE CITY, MINN.—The Eastern Minnesota Power Company contemplates the installation of a 500-kw. steam turbine, also developing a water power of approximately 1000 hp., which will include 10 miles of electric transmission line to connect with its present plant. R. P. Allen is manager.

ALBIA, IOWA.—The Albia Light & Railway Company is rebuilding its plant, work on which is nearly completed.

DES MOINES, IOWA.—Plans for extensions and improvements to the system of the Des Moines City Railway Company, providing for an expenditure of about \$300,000 this year, will be submitted to the City Council.

MADRID, IOWA.—Plans have been prepared by the People's Telephone Company for improvements to its system, to include a new or remodeled exchange building, new switchboard of the common-battery type and improvements to the telephone lines.

MAQUOKETA, IOWA.—The Iowa Electric Company is extending its 33,000-volt transmission lines to Anamosa. A 300-kw. General Electric generator directly connected to a Buckeye cross-compound engine has been recently installed in the local power plant. John Drabelle is electrical engineer.

MARSHALLTOWN, IOWA.—Improvements are contemplated to the municipal electric-light plant, including the installation of a new 150-kw. generating unit and extensions to the overhead transmission system.

BOWLING GREEN, MO.—Extensions and improvements have been made to the system of the Pike County Electric Light & Power Company, including the erection of 11 miles of electric transmission lines. Mrs. D'Arline Holcomb is president.

ELDORADO SPRINGS, MO.—The Missouri Valley Light & Power Company has purchased another generating unit, consisting of a three-phase, 60-cycle, 2300-volt generator directly connected to a Russell

compound engine, to be installed in April. C. C. Arthaus is superintendent.

LEWISTOWN, MO.—H. H. Bronson, owner of the local electric-light plant, is contemplating the installation of direct-current generator and meters.

MARSHFIELD, MO.—The plant of the Marshfield Electric Company is being overhauled and among the improvements contemplated is the installation of an additional generating unit and the establishment of a day service. Karl Keesy is general manager.

ST. LOUIS, MO.—Plans have been prepared by Charles H. Wray, architect, Riado Building, for the construction of a hospital at Grand and Shaw Avenues, for the Missouri Pacific Railway Company, to cost about \$2,000,000. The plans provide for the installation of a refrigerating plant, boilers, engine, generator, pumps, etc. Bids, it is understood, will be asked for after Feb. 10.

SPRINGFIELD, MO.—Improvements involving an expenditure of from \$15,000 to \$20,000 are contemplated by the Springfield Ice & Refrigerating Company, which will include the installation of new machinery and the purchase of new equipment for the plant.

CAVALIER, N. D.—James Lang, owner of the local electric-light plant, expects to install an additional 35-hp. oil engine.

RAY, N. D.—The plant of the Ray Electric Company is being remodeled and enlarged. Oil storage tanks will be installed as soon as prices get back to normal. A. H. Meyer and R. W. Habein are owners.

BANCROFT, NEB.—The City Council is considering the installation of an electric-lighting system in Bancroft.

CLARKSON, NEB.—Extensions and improvements are contemplated to the municipal electric-light plant this summer to provide for an 18-hour service. L. J. Roubineck is superintendent.

LUSHTON, NEB.—Henry Garb, who owns a large farm near Lushton, is planning to construct an electric power plant on the Blue River to supply electricity in the town of Lushton and the farmers residing along the route of the transmission line.

OMAHA, NEB.—Bids, it is reported, are now being received by George B. Prince, Omaha National Bank Building, Omaha, for electric wiring, heating and plumbing of the new telephone building of the Nebraska Telephone Company, to be erected at Nineteenth and Douglas Streets, at a cost of about \$750,000.

O'NEILL, NEB.—The McGinnis Creamery & Produce Company is contemplating the installation of a new 250-hp. boiler.

PENDER, NEB.—New machinery is being installed in the municipal electric-light plant. J. W. McCready is manager.

RED CLOUD, NEB.—The City Council is considering the erection of a smokestack at the municipal electric plant to cost about \$1300.

ST. EDWARD, NEB.—The Nebraska Gas & Electric Company, Karbalk Building, Omaha, is now installing a new 75-hp. gasoline engine at its local plant. Mrs. P. B. Sargent is local manager. W. C. Ross of Omaha is general manager.

WAYNE, NEB.—New equipment is being installed in the municipal electric and water plant, including one Vilter Corliss engine, 14 in. by 30 in. and 75-kw., and one 37½-kw. three-phase, 60-cycle, 2300-volt generator. E. Merrill is manager.

WILSONVILLE, NEB.—Two new 7½-kw. transformers are being installed on the transmission lines of the municipal electric-light plant. A. L. Frederickson is superintendent.

ABILENE, KAN.—The Riverside Light, Power & Gas Company has nearly completed the installation of a 1250-kva. General Electric turbine at its plant. H. B. Gemmill is manager.

BALDWIN, KAN.—The transmission lines of the municipal electric light plant are being changed from direct to alternating current. A. W. Kirby is manager.

COLLYER, KAN.—The installation of an electric-light plant in Collyer is under consideration. For further information address Dr. LaCerte, editor of the *Collyer Advance*.

LEON, KAN.—Plans are being prepared by W. B. Rollins & Company, Railway Exchange Building, Kansas City, Mo., for a municipal electric-light plant in Leon, to cost about \$15,000.

WELLSVILLE, KAN.—The Wellsville Electric Light, Power & Ice Company is contemplating the purchase of some 5 or 10-kva. transformers very soon. C. A. Smith is owner.

Southern States

NEWBERN, N. C.—Contracts have been placed by the city of Newbern with the General Electric Company for a 750-kw. Curtis turbine and with the C. H. Wheeler Company for a surface condenser for October delivery. When improvements are completed the plant will have a capacity of 1150 kw. The old 360-kw. outfit will be sold. F. G. Godfrey is superintendent.

ROCKY MOUNT, N. C.—Preparations are being made by the city of Rocky Mount for improvements to the municipal electric-light plant including the installation of a 300-hp. Heine type boiler, plans for which are now being prepared by J. N. Eley, Empire Building, Atlanta, Ga. The city also contemplates the purchase of a new generating unit at the gas plant, prices for which are now being asked for and contracts will be let within 60 or 90 days. The city would like to receive prices and other information on the proposed improvements. A. S. Lyon is superintendent of the municipal light plant.

WARRENTON, N. C.—The Warrenton Electric Light Company is planning to erect a three-phase, 2200-volt transmission line, using No. 4 wire, in the spring. The company will also connect 65 additional horsepower in motors for corn and flour mills, making a total of 261 hp. in motors connected. J. M. King is manager.

JOHNSTON, S. C.—The electric-light plant and ice factory of the Carolina Public Service Company has been purchased by F. M. Boyd, manager. The new owner proposes to install machinery for a flour and feed mill, to be operated in connection with the light and ice plant.

ALBANY, GA.—The Albany Power & Manufacturing Company is contemplating the installation of a 600-hp. water tube boiler, working pressure 185 lb., hand fired. E. S. Killebrew is superintendent.

BRUNSWICK, GA.—The Emergency Fleet Corporation has notified the Chamber of Commerce that at least 1000 houses will have to be erected at Brunswick within the next 60 days. All these houses, it is understood, will be wired for electric lighting.

DALLAS, GA.—Application has been made for a charter for the Dallas Utility Company to construct and operate electric-light and power plants to supply electricity for lighting towns and cities and to operate railroads and street car lines, etc. The company will be capitalized at \$45,000 with the privilege of increasing it to not more than \$100,000. R. D. Leonard, J. W. Hay and J. F. Welch are interested in the company.

SAVANNAH, GA.—Plans for the installation of an entire street-lighting system have been submitted to the City Council by L. A. S. Wood, illuminating engineer of the George S. Cutter Company of South Bend, Ind. Under the first plan the city is to install the necessary substation equipment, distributing system and lighting units, to be operated by the city, energy to be purchased in bulk; second, to replace the present arc-lamp lighting system with gas-filled or Mazda type "C" lamps; third, the abolition of the present ornamental cluster lamps on Broughton Street and the substitution of one-lamp posts. The cost of the first proposition is estimated at \$65,427. The Savannah Electric Company has the contract for lighting the city, which does not expire for some time.

STATESBORO, GA.—A new 200-kw. General Electric turbo-generator is being installed in the municipal electric-light plant. The system will be changed from two to three phase. Daniel L. Gould is superintendent.

BONIFAY, FLA.—The City Council has engaged the J. B. McCrary Company of Atlanta, Ga., as engineer and contractor for the proposed electric-light plant and water-works system. The cost of the work is estimated at about \$21,000.

ST. PETERSBURG, FLA.—The St. Petersburg Lighting Company contemplates improvements to its plant, involving an expenditure of about \$40,000.

HAMPTON, TENN.—J. H. Edens, it is reported, will rebuild the local electric-light plant, recently destroyed by fire.

HARRIMAN, TENN.—The Harriman Foundry & Machine Works has purchased the property of the Harriman Cotton Mills Company, which it will rebuild and equip to manufacture mining cars and contractors' equipment. The power plant in the mill will be dismantled and the plant equipped for electrical operation (individual motor drive). W. S. Baker is manager.

TUPELO, MISS.—New equipment, including a 100-hp. synchronous Westinghouse motor directly connected to a No. 5, two-stage Cameron steam turbine centrifugal pump is being installed in the mu-

municipal electric-light and water plant. E. R. Hisholm is superintendent.

PINE BLUFF, ARK.—The Pine Bluff company is now installing a 2500-kw., General Electric, three-phase, 60-cycle, 2300-volt generator. H. C. Couch is president.

CHANDLER, OKLA.—The Washita Electric Power Company, it is reported, will build a new power house, 50 ft. by 75 ft., in Chandler. The present equipment will be installed and new machinery, including a 40-hp. high-pressure boiler, a 150-hp. Corliss engine, directly connected to a three-phase, 60-cycle, 2300-volt generator will be added. The distribution will probably be rehauled and extensions made. For further information address R. K. Johnston of Auls Valley.

CHECOTAH, OKLA.—The Checotah Water, Light & Ice Company is installing an additional electric generating unit, consisting of a 250-kw. Allis-Chalmers generator, a 350-hp. Monarch Corliss engine and three Atlas boilers, and other necessary equipment, to cost about \$20,000. L. B. Riffing is secretary and manager.

AMARILLO, TEX.—The City Commissioners are considering calling an election to submit the proposal to issue \$200,000 in bonds for the construction of a municipal electric-light plant.

BRYAN, TEX.—The City Commission has granted the Bryan Power Company a permit to erect an electric transmission line from the terminus of the city line to the plant of the Gulf Refining Company, which is outside of the city limits.

GALVESTON, TEX.—Bonds to the amount of \$300,000 have been authorized. The proceeds to be used for lighting and other street improvements.

HEREFORD, TEX.—The Hereford Electric Light & Power Company is replacing a 40-hp. Corliss engine with a 160-hp. Skinner "Unaflo" engine, which will be installed within the next 60 days. The company is also installing a few 15-hp. motors for irrigation purposes. F. H. Oberthier is manager.

JEFFERSON, TEX.—The installation of electrical pumping equipment at the city pumping station is under consideration by the City Council.

LAMPASAS, TEX.—The Lampasas Light & Power Company is installing a pump connected to a 40-hp. three-phase motor to pump the city water, which will be completed in about 60 days.

SAN ANGELO, TEX.—The San Angelo Electric & Power Company contemplates improvements to its plant, involving an expenditure of about \$10,000.

Pacific and Mountain States

ARLINGTON, WASH.—The plant of the Washington Coast Utilities Company, located near Arlington, has been put out of commission by recent floods. A new site, it is reported, must be selected.

CLE ELUM, WASH.—The Town Council is granted the town of South Cle Elum franchise to construct and operate overhead and underground wires on certain streets in Cle Elum for the transmission of electricity for lamps, heaters and motors.

PE ELL, WASH.—The North Coast Power Company of Chehalis, it is reported, is contemplating extending its electric transmission lines from Pe Ell to Meskill.

PORT ORCHARD, WASH.—The Puget Sound Pulp & Power Company has petitioned the Commissioners of Kitsap County for a franchise to erect and operate electric transmission lines over the highways of the county for a period of 25 years.

SEATTLE, WASH.—Plans have been completed by the Puget Sound Traction, Light & Power Company for the superstructure of its proposed coal-pulverizing plant, adjoining the power station on Western Avenue and Seneca Street, to cost about \$5,000.

SEATTLE, WASH.—The construction of third unit at the Union Lake power plant, an estimated cost of \$600,000, in the immediate future, has been recommended by J. D. Ross, superintendent of lighting. The second unit, for which \$390,000 was authorized, is nearing completion.

SEATTLE, WASH.—The City Light Department has made arrangements with the Inman Mills Company to supply the department with 1500 kw. to assist in providing for the extra demand for power. An additional 600 kw. will be obtained from the small hydroelectric plant, which was built to utilize the excess water from the Plunier Park reservoir, but which was never put to use.

TACOMA, WASH.—The city of Tacoma has entered into a contract with the Amer-

ican Nitrogen Products Company of La Grande to furnish electricity to operate the nitrogen plant of the company for a period of five years.

TACOMA, WASH.—The City Council has practically decided on the site near Mineral on which to erect the proposed new unit of the municipal power plant, to cost between \$750,000 and \$1,000,000. N. L. Taylor, engineer of the light department, has charge of boring test holes to locate bedrock at the site.

WINLOCK, WASH.—The Independent Electric Company has recently transferred its franchise to supply electricity for lamps and motors in Toledo, Winlock, Vader and Napavine to the Idaho-Washington Water, Light & Power Company. The new company will secure energy to operate its system from the power plant of the Winlock Lumber Company, about 1 mile south of Winlock.

EUGENE, ORE.—A report of the proposed improvements of the power plant at Waterville has been submitted by N. C. Nelson, engineer of the water and light board, which recommends the construction of a wing dam on the McKenzie River to develop 3000 hp. The plant now has a generating capacity of 2400 hp., and it is recommended that a gate be placed in the forebay to accommodate a second penstock later to supply a third unit. The plant is now built in two units.

GOLD HILL, ORE.—The Utah Mining Properties, located about 12 miles from Gold Hill, have been acquired by O. C. Runnalls of Seattle, Wash., and associates. The new owners contemplate the erection of an electric transmission line, about 5 miles long, to connect with the lines of the California-Oregon Power Company. It is proposed to equip the mines with electrically-operated machinery.

PORTLAND, ORE.—S. C. Jagger of the Morrison Electric Company, and J. H. Stroufe, formerly representative of the Ne-Page, McKenny Company of Seattle, it is reported, have secured a contract for electrical installation in 20 ships under construction for the Republic of France by the Foundation Company of Portland.

CALISTOGA, CAL.—The State Railroad Commission has authorized the Calistoga Electric Company to sell its electric distributing system in and about Calistoga to the California Telephone Company of Santa Rosa at \$28,900.

DEL MAR, CAL.—Application has been filed with the State Railroad Commission by the San Diego Consolidated Gas & Electric Company asking for permission to purchase the distributing system of the Del Mar Water, Light & Power Company, at \$11,037.

HANFORD, CAL.—The People's Ditch Company of Hanford, it is reported, is considering the construction of a new electric-light and power plant for local service.

LODI, CAL.—Among the improvements contemplated to the municipal electric-lighting system are the installation of voltage regulators and additional one-lamp electroliters. John A. Henning is superintendent.

LOS ANGELES, CAL.—The Southern California Edison Company has applied to the Board of Supervisors for a franchise to erect and operate electric transmission lines throughout the entire country for a period of 40 years.

LOS ANGELES, CAL.—Two applications involving proposed expenditures of over \$1,000,000 have been filed with the State Railroad Commission by the Southern California Edison Company. One involves the impounding of the waters of Pitman Creek in Fresno County and the other the waters of Salmon and Horse Creeks in Tulare County. It is proposed to store the waters of Pitman Creek and divert a portion of same to Big Basin reservoir, on Big Creek, and the remainder directly into conduits leading to power plants below. The cost of dam and conduit line to Big Basin Reservoir is estimated at \$842,900. The Salmon and Horse Creeks project provides for the construction of a reservoir with a capacity of 14,049 acre-ft. This diversion is supplementary to a previous one and is intended to augment the supply delivered to Kern River power plant No. 3 during the period from August to December of each year.

PALO ALTO, CAL.—Work has begun on the new electric plant to be erected in what are known as the "corporation yards" on the Stanford Campus near the new University Press Building. It will change the center of electrical distribution from the station underneath the law building on the inner quadrangle.

PITTSBURG, CAL.—The State Corporation Commissioner has granted the Great Western Electro Chemical Company per-

mission to sell 7000 shares of capital stock, the proceeds to be used for extensions to its plant in Pittsburgh.

REDDING, CAL.—The electric power plant, planing mill and boiler house of the Shasta Land & Timber Company of Redding, it is reported, was recently destroyed by fire, causing a loss of about \$50,000.

RIVERSIDE, CAL.—The transmission lines of the municipal electric-light plant will soon be extended to the municipal rock crusher at the end of Central Avenue.

SAN FRANCISCO, CAL.—The Asher Electrical Company, 607 Howard Street, San Francisco, has been awarded the contract for the installation of a street-lighting system and the interior wiring of the barracks buildings at the camp at Angel Island.

KINGMAN, ARIZ.—J. B. Girard has resigned his position as city engineer, it is reported, to devote his entire time to the project of building a large dam in the Grand Canyon at Diamond Canyon. Preliminary work has been completed and work on construction of dam will begin as soon as spring floods subside. Electricity generated at the proposed plant, it is stated, will be used in connection with equipping the Santa Fé Railroad between Needles and Winslow for electrical operation.

ABSAROKEE, MONT.—The hydroelectric power plant of the Absarokee Power Company will be completed and placed in operation in about a month. Edward R. Reber is manager.

HAMILTON, MONT.—The Missoula (Mont.) Light & Water Company has offered to sell its water-works system in Hamilton to the city for \$75,000.

WOLF POINT, MONT.—The local electric-light plant has been purchased by J. E. Galehouse of Carrington and C. B. Aasness of Bismarck, N. D.

DENVER, COL.—The Nevada-California Power Company, it is reported, is contemplating erecting a high-tension transmission line from its power plant on Bishop Creek, Cal., to Reno, Nev., to supply electricity to the large mining camps of Nevada, the Owens Valley, Imperial Valley and Arizona districts.

BATTLE MOUNTAIN, NEV.—The Nevada Valleys Power Company of Lovelocks has taken over the local plant. Work will begin at once for the installation of a 130-hp. engine. When improvements are completed a day motor service will be established. W. W. Mason will have charge of the system in Battle Mountain.

LAS CRUCES, N. M.—The construction of a hydroelectric plant as part of the Elephant Butte reclamation project is advocated by the Rio Grande Water Users' Association. Dr. Nathan Boyd of Las Cruces is at the head of a committee which is promoting the project.

Canada

CHILLIWACK, B. C.—The city of Chilliwack was recently cut off from all power, light, telephone and telegraph service and water supply by storms. About six weeks, it is estimated, will be required to put the electric-light and power system in operation.

CHESLEY, ONT.—The Chesley Chair Company is reported to be in the market for a number of electric motors of from 5 to 30 hp.

COPPER CLIFF, ONT.—The Canada Copper Company, it is reported, is in the market for an electrically-driven pump, 150 gal. per minute capacity, mine pump head of 1100 ft., discharge 6 in., and a 100-hp. alternating-current, 550-volt, direct-driven motor.

TORONTO, ONT.—The general contract for the construction of a boiler house to be erected at the plant of the Swift Canadian Company has been awarded to the John V. Gray Construction Company.

MONTREAL, QUE.—The Southern Canada Power Company, Christine Building, Montreal, is contemplating the erection of about 100 miles of high-tension transmission line and has asked for tenders on poles, cross-arm braces, wire and other material for same. C. A. Haskell is purchasing agent.

Miscellaneous

JUNEAU, ALASKA.—The Union Power Company, recently incorporated, has acquired property for the construction of a hydroelectric power plant in Willow Creek district. An electric transmission line, about 12 miles long, will be erected to reach the neighboring mining properties.

New York, Saturday, February 16, 1918

Number 7

Electric Features of the Windsor Plant

IN THIS issue is an article which deals with some of the electrical features of the great Windsor (West a.) station, the mechanical features of which were discussed last week. The not unusual arrangement of double bus system is employed into which the great generators feed. To prevent some of the most serious risks of operating several large generators in parallel the bus is sectionalized by reactors. The switches controlling these protective devices are automatically interlocked in a rather novel manner with the generator switches, thus preventing the generators ever being cut on the bus without the reactors in service, unless intentionally in some special case of emergency. Still further to protect against the danger of surges, really very serious in stations of large output, an oil-insulated condenser is connected with the bus to relieve sudden and abnormal electrical strains. Each of the great turbo-generators carries a direct-connected exciter big enough to supply two generators in a pinch. In addition to this a 250-volt exciter bus, arranged for the connection of all the exciters and all the machine fields, has been installed, running the full length of the station. A motor-generator set can feed into this general bus. The auxiliaries for each turbo-generator are motor-driven at 550 volts, and each set therefore has its own three-phase transformer to feed these auxiliaries, stepping down the main supply from 11,000 volts. Beyond the main switch house the high-tension energy is delivered at two separate high-tension yards belonging to the two companies associated in the ownership of the station. Four high-tension feeder equipments are supplied from the high-tension transformers at 11,000, 25,000, 66,000 and 130,000 volts respectively. The transformers for the two latter voltages are wound so as to be interchangeable. All feeders are equipped with inverse-time-limit relays, while the transformers have definite time-limit relays, the settings for these being adjusted to the feeder necessities.

In the control room of the station one feature has been introduced which is both unusual and important. From this point can be read the temperatures of the transformers in the high-tension yards and also local temperatures at important points in the turbo-generators themselves. Besides this, an alarm system is installed to give warning of any interruption in the flow of the cooling water to the high-tension transformers. The system has clearly been worked out with a keen eye to the future, when the output of the station will rise to enormous figures and will be delivered over widely ramifying networks to great distances.

Saving Fuel and Boilers

IN THE present fuel situation even small economies in coal are worth considering, and when, together with material saving in actual fuel, come a lowered upkeep of the boilers and better steaming capacity it is clear that the matter rises to considerable importance. S. B. Applebaum's paper in the present issue is a thorough study of methods and results with respect to the treatment of feed water to obviate scale. Hard water, particularly of certain types, tends to form scale at a somewhat surprising rate. The effect of this is threefold. It lessens the efficiency of the fuel consumption, decreases the ultimate steaming power of the boiler, and tends to the rapid destruction of tubes. A coating of scale even up to a quarter of an inch (6.3 mm.), thick and nearly as hard as stone, may form in a few months' use of bad water, and such coatings have not been unknown in boilers of electric light plants. Such a non-conducting coating produces results that are unpleasantly obvious, and even when existing in such smaller quantity, scale produces serious loss from every standpoint. The actual loss in fuel depends, of course, upon the amount of scale, which is itself a function of the quality of the water and of care in treating it or cleaning the boilers.

The prevention of scale, either by chemical or mechanical means, the former being much the easier, has been found, as a matter of experience, to save anywhere from 5 to 20 per cent or more of the total fuel bill, to say nothing of the gain in lessened cost of repairs to the boilers—a very serious matter, particularly in the cases where boilers have to be hard pushed to carry over the peak of the load. Mr. Applebaum gives some very instructive data, especially with respect to locomotive boilers, in which it has been repeatedly found that the saving in boiler repairs is a large item, amounting in some cases to at least 5 per cent. The general remedy for scale is found in artificial softening of the water by chemical means, of which there are several available. Mr. Applebaum discusses at some length the actual methods employed, in their bearings on boiler economy, and shows what might have been anticipated—that the net saving is sufficient to pay richly for the installation of the water-softening plant wherever conditions which point to the free formation of scale exist. The actual net gain in coal, repairs and lessened cost of boiler cleaning amounts in the example given by Mr. Applebaum to some \$2.50 per horsepower per year. Of course, the actual figures will vary considerably with the conditions and with the hardness of the water.

Efficiency of Electric Cooking

WITH the great awakening of interest in electric cooking comes a demand for better apparatus. In principle the use of electricity for heating purposes is at almost theoretically perfect efficiency. The difficulty is not in the conversion of electrical into thermal energy but in the utilization of the latter, and there is just as much opportunity for waste at this point as in any other form of heat utilization. In fact, electric heating has suffered in the past and is still occasionally suffering from a certain thick-headedness of the designer which results in an attempt to carry an outward resemblance to old-time inefficient gas and coal ranges into electric range design, often with somewhat disastrous results in the way of efficiency. Prof. R. G. Kloeffler's study of electric range efficiency is of very direct value in showing both the strong and the weak points of such apparatus as is now produced. From an experimental standpoint his task was a simple one. It consisted of measuring the input of energy at the heating unit and the output in heat obtainable therefrom. In practice the output was reckoned by heating water to approximately the boiling point, using in succession various types of utensils adapted to the purpose. The surface heating units on eight different electric ranges were thus tested, three units being of the inclosed-conductor type, four of the open-conductor type and one unclassified. The utensils used were of graniteware and aluminum, these being the materials which are in common use.

Now the notable thing in summing up these experiments is the generally low efficiency obtained. Very few figures for any utensil on any range ran over 50 per cent when starting with the heating unit and water at ordinary room temperature, showing that the chief fault in the electric range used in this way is ineffective heat insulation or no heat insulation at all. Certain experiments further prolonged so that the heat stored in the heating-unit utensils and their surroundings could be more fully utilized gave, of course, a higher efficiency; but the plain fact is that a heating unit made and used after the similitude of the gas range or the coal range is much less efficient than an electric heating device ought to be. Roughly, more than half the energy is wasted. The obvious moral is that by better design, and particularly by the use of thorough heat insulation and special utensils adapted to make the best of it, one could do electric cooking with very much less energy than is necessary on the ordinary commercial range. The cause of this fault, it seems to us, is not generally lack of designing skill on the part of the maker of the heating apparatus, but an unfortunate disinclination to break away from the bad precedents established by ranges of the older kinds. The chief requirement is that the electric heat should be applied as directly as possible with as small losses from conduction and convection as are obtainable. In practice these losses are generally much greater than they ought to be. In electric ovens, which have relatively very large surface, heat insulation is even more important than elsewhere in the range.

Professor Kloeffler's tests were made by giving to the ovens fixed input until the internal temperatures became steady. Three different final temperatures, corresponding roughly to a quick, a medium and a slow

oven, were tried out. The results of these tests were particularly interesting and the details will well repay careful reading.

Output Coefficients for Small Direct-Current Motors

IN THE design of dynamo-electric machines of an already established type a question often arises as to the particular dimensions which should be adopted for intermediate sizes and ratings. If the dimensions are excessive, the machine when constructed is likely to be heavy and expensive for its output. If, on the contrary, the dimensions are chosen too small, the speed or efficiency may be unsatisfactory.

It is therefore very desirable to have guiding rules by which the principal dimensions of new sizes of machines can be laid down on a reasonable and scientific basis. In a general way, the output of a machine will be approximately proportional to the volume of the armature and to the rated speed, but the speed cannot be left open to final adoption after all the other particulars have been settled. In motor production the speeds of operation under rated load may indeed be divided into two or more groups, such as high-speed, low-speed and intermediate-speed types of motor; but in each of such groups the speed is expected to diminish with the size and output of the motor in some systematic way. Consequently the rating of any new motor will probably involve a definite associated rated speed, and the dimensions of the armature and field magnets must be such as to provide the assigned load and speed without undue weight, cost, heating or sparking.

The curves given in E. W. Kellogg's article in this issue supply information in convenient form for the design of a particular type of motor in intermediate sizes. Starting with a trial armature diameter, the designer determines the sizes and magnetic carrying power of the armature teeth and then adjusts the length of the armature core to provide the correct torque and speed at rated load. It is assumed that several designs will be attempted with slightly different armature diameters, so as to enable a proper selection to be made.

In order still further to guide the designer, a curve sheet is offered for arriving at a suitable starting diameter, having given the required output and speed.

What Shall We Do with Labor?

WAR'S wastage of labor means a loss to the industry which will have to be taken into account. The effect will be felt more acutely in those branches where labor is a large part of production cost than in, for instance, the central station, where it is relatively a small part. Nevertheless, no section will remain untouched by the growing independence of labor. Charles M. Schwab said a few days ago that the worker was to dominate the world. A more temperate statement, that of former Supreme Court Justice Hughes, a student of industrial relations accustomed to consider and weigh. Before the New York Bar Association last month he said: "Individual privilege [in the future] will have to show cause before a public to which old traditions are no longer controlling—a public trained in sacrifice—which will enforce its own estimate of the common right." And again he said: "The present e-

exercise of authority over the lives of men will hereafter find its counterpart in a more liberal exercise of power over the conduct, opportunities and possessions of men."

Two theories are advanced as to the future of labor supply. One is that this country will absorb Europe's supply; the converse is that a new-born Europe will attract its sons and grandsons from our foreign shores. Either theory recognizes that labor will be in keen demand and that, like commodities, labor will tend to flow to those markets which promise the largest return. Electrical industries will need to attract and hold their workers against all outside bidders, either here or abroad.

Mr. Schwab and Justice Hughes had the courage to recognize the changing order. Narrow minds, however, will rail and rant, urge that capital prepare to fight for its position, and declare that no man shall dictate how they shall run their plants. Such minds are not changed by dissertations on the reasonableness of the new order, which decrees that the public good shall take precedence over private gain, that the public cares for the individual and demands that he shall have a voice in determining the conditions under which he works.

Those who question the accuracy of the judgment that warns against new conditions in the realignment of labor and capital will do well to heed the words of Secretary of Labor Wilson at the great loyalty labor meeting in New York on February 10: "In all the legislation to fix prices there has never been one line for the limitation of the earnings of workers." What we are concerned with in these historic times is not whether it is just or unjust to fix the wages of capital and to leave deliberately untouched the wages of labor; what we are concerned with is the overwhelming fact that this situation is here, it is unescapable, there is nothing to do but accept the problem and solve it.

And what of efficiency, now at a low mark in industrial plants? Education is the answer—education through participation in management regarding the factors which affect profits; education engendering responsibility for success of the industry, a realization that there can be no labor prosperity without industrial prosperity—a realization that will be turned into effective action by confidence that labor will get "its share" of the profits it helps to create. A long process, yes, but necessary one.

Labor sells a service, capital buys a service. Seller and buyer continue to do business only when each is reasonably satisfied with the bargain. Far-seeing employers are ready to make sacrifice. So, too, are forward-looking labor leaders. The country demands that both sides look carefully to it that they be not misrepresented. Above all, let both be prepared for large concessions. In that direction lie peace and the country's good.

Motors in the Textile Industry

ANOTHER of Professor Clewell's capital articles takes up in the current issue the rapidly increasing use of motors in textile mills, an art which in its beginnings goes back very nearly five-and-twenty years, but which has been rapidly improved as conditions have gradually led to the adoption of more and more independent methods of motor driving. In the beginning the cotton industry clustered about water powers where motive power could be cheaply obtained. As the steam engine became more highly developed in efficiency and as mills outgrew their normal supply of water power and fell back upon steam auxiliaries, the waterwheel found relatively less and less use. In the forty years from 1870 to 1910 it had fallen from 60 per cent of the total to about 20 per cent. Steam power had increased from some 40 per cent to 60 per cent, and the remaining 20 per cent was furnished by electric power. It has been estimated that by 1920 the percentage of electric power will easily have doubled. In the earliest electrical mill drives the steam engines were replaced by fairly large motors employed for group driving. The steady tendency of late years has been more and more toward individual drive, which is easily employed in new mills and gives greater possibilities of power economy than have been afforded by the methods that it supersedes.

Probably the typical mill consists of a combination group and individual drive, the former for certain machinery operated, so to speak, in blocks, each consuming no very great amount of power in the aggregate; the latter for the heavier and more independent work. For mill work the induction motor is chiefly used, since for most classes of work unusual flexibility of speed regulation is not required. At the beginning of the art competition with direct-current machinery caused the building of induction motors with extraordinarily low speed variation, a tendency which has of late given way to more normal design. In a few places in mills motors of special type have to be employed on account of the presence of large amounts of dust and lint in the air, and in some cases because of troublesome vapors that arise.

Experience shows that the electric drive for this work has not only the usual advantages of facilitating a cheap supply of motive power but also leads to a larger and more uniform output on account of the better operating characteristics of subdivided motive power. There is every indication that the use of motor drive in mills is going to increase steadily, bringing the greater water powers into active use in this class of manufacturing and superseding not a few of the steam drives now in use.

ONE of the articles which will be presented next week will show the effect of wave form and frequency of a source of energy on the performance of mercury-vapor rectifiers. Mechanical features of the new power station of the New Bedford (Mass.) electric service company will also be described. This plant has some unusual coal-handling and boiler-room arrangements. Another article by Professor Clewell will be presented in that issue

The Coming Issues

on the advantages and disadvantages of flywheel effect with certain classes of electrical drive. The possibility of utilizing flywheel effect to perform a useful function in preventing disturbances on supply lines which serve fluctuating loads will be discussed at length. Professor Kloeffer's analysis of electric range operation will be concluded next week and will contain the results of efficiency tests on a number of ovens.

of auxiliaries attached to one unit are about 1500 kva. The stoker motors are not included in this aggregate since they are direct-current machines and are operated from 600-volt motor-generator sets which also supply cranes, hoists, automatic elevators and coal-mining equipment. Two separate 1800-kva. station auxiliary transformers, in addition to the one attached to each turbine, are operated from the 11-kv. bus section and supply motors about the station which are not directly connected with any particular unit. They also supply energy for operating the motor-generator sets which furnish energy for the direct-current auxiliaries.

FEEDERS AND HIGH-TENSION EQUIPMENT

From the switch house the energy is delivered to two separate high-tension yards owned by the West Penn Power Company and the American Gas & Electric Company respectively. The feeders leaving the station can be divided roughly into four groups, namely, 11-kv. feeders, which supply local industries; 25-kv. feeders, which supply a network of the West Penn system; 66-kv. feeders, which supply some of the lines of the American Gas & Electric Company; 66-kv. feeders, which will ultimately operate at 130 kv. and which serve a part of the West Penn system, and 130-kv. feeders, serving the longer lines of the American Gas & Electric Company. All of the feeders leaving the station are laid out on the radial system, arrangements being made for parallel operation of two lines in case of emergency. It is understood by the operators, however, that radial operation is preferred and that parallel operation is an emergency measure.

Each of the 11-kv. feeders is equipped with a 3 per cent current-limiting reactor. These reactors, like all other reactors in the plant, were not arbitrarily chosen but were selected to limit the current which might flow

buses in the high-tension yards of the two companies.

From the main 11-kv. bus the energy which is to be transmitted at 130 kv. leaves the station through 30,000-kw. banks of transformers, the low-tension switches for which are installed inside the station. No switches are provided on the low-tension side of the transformers in

FIG. 5—ONE OF THE HIGH-TENSION YARDS WITH APPARATUS ELEVATED TO ESCAPE HIGH WATER

the high-tension yard. Here a high-tension transfer bus is provided, so that the load from any outgoing 130-kv. line can be distributed over other operating banks of transformers in case it is necessary to shut down one bank.

In the 66-kv. yard of the American Gas & Electric Company a double 66-kv. bus has been provided. It is at present supplied by a bank of 20,000-kva. transformers, as all outgoing 66-kv. feeders are connected to this bus. Provision is made for future installation of a bank of 66-kv. transformers when the load conditions

FIG. 4—HIGH-TENSION YARDS OF WINDSOR (W. VA.) POWER PLANT CONNECTED WITH STATION BY BUSBARS CARRIED IN TUNNEL

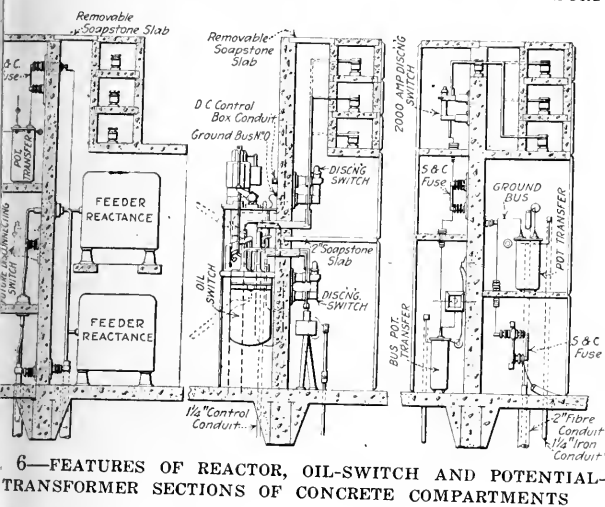

into a short to a value well within the rating of the smallest oil switch in the circuit.

All of the 66-kv. and 130-kv. transformers are wound so as to be interchangeable. Furthermore, the 66-kv. units are arranged so that they may be operated later at 130 kv. To provide further flexibility, arrangements have also been made for connecting together the 66-kv.

require it. In the West Penn high-tension yard the 66-kv. bus is normally only a transfer bus, the energy being supplied through a bank of 30,000-kva. transformers. The same provision for flexible operation is made in this yard as obtains on the 130-kva. bus of the American Gas & Electric Company.

The control of turbines, exciters and auxiliary trans-

termers is centered on a benchboard so placed in the operating room that the operator faces the turbine room while handling the equipment. A glass partition between the operating room and the turbine room permits view of practically the entire floor of the latter. Outgoing feeders are controlled from a vertical switchboard

the opposite side of the room from the benchboard. Voltage regulators and curve-drawing instruments are placed on pedestals at the center of the room. The 110-volt direct-current board and the watt-hour-meter board are at opposite ends of the operating room. This arrangement places the switchboards requiring the most attention at the most convenient location for the operator. It was also thought advisable to place the battery-charging equipment and panels in an alcove off the operating room where they are readily accessible to switchboard operators. One of the unusual features of this room is a provision for reading the temperatures of transformers in the high-tension yard and the temperatures of important parts of the 30,000-kw. generator. Alarm bells and lamps are also placed here to notify operators of any interruption in the flow of cooling water to the high-tension transformers.

The 11-kv., 25-kv., 66-kv. and 130-kv. feeders are all equipped with induction-type inverse-time-limit relays, and the transformers are protected by definite time-limit relays. The 25-kv. and 66-kv. relays are given a time setting of two seconds, the 130-kv. relays are given three seconds, and the transformer relays also three seconds. The settings for the 11-kv. feeders, which supply only local territory, are not determined. The turbo-generators, oil switches, switchboard equipment, auxiliary transformers, reactors, auxiliary motors, turbines and equipment in the high-tension yard of the American Gas & Electric Company were supplied by the General Electric Company. The condensers, pumps and all equipment in the West Penn high-tension yard were supplied by the Westinghouse Electric Manufacturing Company. The boiler-feed and service pumps were supplied by the Worthington Pump & Machinery Corporation; the bilge pumps by Yeoman Engineering Company with Cutler-Hammer control, and the traveling screens by the Chain Belt Company. The lighting system was supplied by the Richardson-Phenix Company, while the soot cleaners were supplied by the American Power Specialty Company and the cranes by the Whiting Foundry & Equipment Company. The construction of the station, including the

high-tension yard of the West Penn Power Company, were carried out by Sargent & Lundy, consulting engineers, Chicago. The high-tension yard of the American Gas & Electric Company was handled by the Electric Bond & Share Company. The sub-contract for the building foundations, the high-tension yard foundations and the railroad foundations were all awarded to the Foundation Company of America. The Riverside Bridge Company obtained the contract for the steel.

OUTPUT COEFFICIENTS FOR D.-C. MOTORS OF SMALL SIZE

Convenient Method of Arriving at Trial Values of Armature Diameter and Length Before Actually Designing the Winding

BY E. W. KELLOGG

THE accompanying curves were intended to supplement courses in dynamo design, but they may be of interest to motor designers in general, inasmuch as they illustrate a very convenient method of arriving at trial values of armature diameter and length. Some textbooks give curves showing average values for flux density as dependent upon armature diameter, and of ampere conductors per inch of circumference in terms of kilowatts rating. Inasmuch as a considerable error in the first assumed value of armature diameter makes only a slight difference in the permissible flux density, the curves mentioned furnish the necessary information for finding the value of D^2L for the armature.

In another curve the total ampere conductors are plotted against watts ÷ r.p.m. This information, in conjunction with the value of ampere conductors per inch already found, determines the armature circumference and hence the diameter. The diameter so found is to be considered as a trial value only, the general procedure* being to try several values above and below

FIG. 1—AVERAGE VALUES OF ARMATURE LENGTH

this, carrying the trial designs to a point where one is seen to be definitely better than the others.

METHOD OF DETERMINING TRIAL PROPORTIONS

The plan of varying the proportions and carrying along several trial designs seems to the writer by far the most instructive way of handling the problem. The plan of first determining a value of D^2L and then trying different combinations of D and L presupposes that the flux density and the ampere conductors per inch of circumference will not be materially affected by

*Gray's "Electrical Machine Design."

the changes in diameter. This is true of large and medium-sized machines, but with armatures less than about 10 in. (25.4 cm.) in diameter the output coefficient falls off rapidly with decrease in diameter, so that an armature 4 in. (10.16 cm.) in diameter and 5 in. (12.70 cm.) long would in general show less capacity

FIG. 2—AVERAGE VALUES OF OUTPUT COEFFICIENT FOR NUMEROUS MACHINES OF DIFFERENT MAKES, SPEEDS AND SIZES

at the same speed than an armature 5 in. in diameter and 3.2 in. (8.1 cm.) long, although the product D^2L is the same for the two. The reason for this lies principally in the fact that with small diameters the slots cannot be made so deep, the space factor is likely to be lower, and the teeth have a greater taper, which makes it generally necessary to use lower flux densities. On the other hand, within reasonable limits the capacity of the machine is directly proportional to the armature length.

A more satisfactory method of procedure for small machines is to select a trial diameter and determine the watts output per inch of length at the speed which has been selected and thus find the necessary armature length. Another diameter may then be tried, the corresponding length determined in the same way, and the designs compared. Instead of finding the volts per

FIG. 3—OUTPUT (WATTS) PER R.P.M. PER INCH OF ARMATURE LENGTH

conductor first and then finding place on the armature for the necessary number of conductors, the type of winding, number of slots, size of wire, number of conductors per slot and their arrangement and insulation should be determined and the dimensions of the teeth and flux density worked out. The output per inch of

length can then be calculated and the armature length fixed.

A 2-hp., 110-volt, 1800-r.p.m. motor will be used to illustrate. Six inches (15.2 cm.) will be selected as trial diameter, and a two-hole winding, consisting of thirty-five coils of six turns each, of No. 12 B. & S. gap wire will be tried. This requires thirty-five slots, 0.2 in. (0.63 cm.) wide by 0.8 in. (2.03 cm.) deep, which gives a tooth width of 0.15 in. (0.38 cm.) at the root. An apparent flux density of 160,000 lines per square inch (24,800 lines per sq. cm.) at the tooth root corresponds to a gap density of 43,000, which with a pole inclosure of 0.65 gives 0.158 volt per inch (0.062 volt per cm.) of conductor. There are 210 conductors in series in each path, so that the necessary voltage per conductor is $110 \div 210 = 0.523$. The armature length must then be $0.523 \div 0.158 = 3.3$ in. (8.4 cm.).

Some guide is desirable in order that the diameter chosen for trial may not depart too far from normal. Average values of armature length expressed in terms of kilowatts rating appear to be as satisfactory a guide as can be found. For a given rating the best armature length is nearly the same for a high-speed machine as for a low-speed machine, the difference in speed being compensated for chiefly by a change in diameter, with only a slight change in length. Fig. 1 shows average values of armature length.

CURVE GIVING APPROXIMATE DIAMETER

Since with small machines the value of D^2L can hardly be calculated until the diameter is known, additional curves are needed from which the probable diameter can be found in terms of the power, speed and armature length. Such curves are given in Fig. 3. To use them the output in watts is divided by the speed in r.p.m. and by the approximate length as given in Fig. 1. This gives the ordinate of Fig. 3, from which the diameter can be obtained.

For example, in the 2-hp., 1800-r.p.m. motor mentioned before, taking the iron, windage and friction losses at 10 per cent, the power converted would be 1660 watts, and $\text{watts} \div \text{r.p.m.} = 0.92$. The armature length from Fig. 1 would be about 3.4 in. (8.64 cm.). The ordinate to the curve in Fig. 3 would be $0.92 \div 3.4 = 0.27$, which corresponds to a diameter of 5.6 in. (14.2 cm.).

The normal diameter and length found in this way are only intended to give an idea of what would be a reasonable size and proportions. The next step would be to select several trial diameters and determine the length corresponding to each by designing the winding and determining the flux density, and to work out several designs to the point where one appears clearly the best. The output coefficients may come out lower than those indicated in Fig. 2 if the slot space cannot be well utilized, or much higher output coefficients may be obtained, especially if greater losses are allowed.

Reducing Costs of Fuel and Boiler Maintenance

How These Costs Can Be Reduced by Softening Boiler-Feed Water—Experiences of Different Users—Features of Different Systems and Operating and Investment Expenses

BY S. B. APPLEBAUM

Assistant Technical Manager the Permutit Company

WITH the increasing scarcity of coal due to increased consumption and congestion of transportation and with the generally higher cost of fuel it is the duty of every one to investigate every possible way that fuel is wasted and how the wastage may be prevented. There is no doubt that the general consideration of burning the coal efficiently in the boiler furnace comes first, but the heating surfaces of the boiler must also be kept clean, otherwise the heat produced in the furnace cannot be utilized fully. Every engineer and fireman knows these things, but they have not been watched carefully in the past owing to the great wealth of natural resources. The time has come, however, when ways must be changed and every pound of coal made to count.

Unfortunately, scale cannot be blown off the tubes by soot, it being necessary in a great many cases to

The individual boiler-tube tests with scale up to $\frac{1}{8}$ in. (3.175 mm.) thick showed widely varying losses up to 12 per cent, depending on the mechanical structure of the scale and the thickness.

An article by H. G. D. Nutting, published in the *ELECTRICAL WORLD* (Volume 66, No. 23, page 1257), described a water-softener installed in a central station in Wisconsin. The effect of the treatment was as follows: "The coal bill has been reduced 18 per cent of its former amount, based on the same load. The coal bill for July, the second month of use of the water softener, was \$514 less than for May, when the softener was not in use—i.e., based on the same output."

RAILROAD EXPERIENCE

Railroads are the largest users of fuel in boilers for the generation of steam, and their experience is most valuable to illustrate the various operating losses due to scale. In 1905 the American Railway Engineering and Maintenance of Way Association, which has a standing committee on water service, issued a report* on "Comparison of the Cost of Installing and Operating Water-Softening Plants, with the Benefits Derived from Their Use." From the experience of about forty railroads with water-treatment plants it selected several as furnishing the most authentic records, each of them having installed at least fifteen or more water-softening plants up to that time.

A summary of the data given in this report follows:

The Atchison, Topeka & Santa Fé Railway installed water softeners in 1903 on divisions in Kansas and Colorado. In December, 1902, it had 456 locomotive-boiler failures from leaking. By using softened water failures from this cause were reduced to only sixty-eight in December, 1903, and twenty-eight in July, 1904. The average annual reduction in such failures due to water softening was 74 per cent.

As regards saving of flues, the locomotives made 363,302 miles (about 584,500 km.) more in the year ended July, 1904, than in the year previous and the store department issued 109,937 linear feet (about 33,500 m.) of flues less than the year before, which was a saving of about 20 per cent in flues. The saving in the labor of boilermakers for repairs for the same time was \$7,000.

The Chicago & Northwestern installed seventeen water softeners in 1903 on its Iowa Division, and these took care of all the natural hard-water stations in the division. The saving in the cost of labor for boilermakers was 36 per cent. The number of failures due to leaks was 583 from August, 1902, to June, 1903. The corresponding number from August, 1903, to June, 1904, was only 120, representing a reduction in failures of 79 per cent. There was also a heavier ton-mileage in 1903 than in 1902, the increase being 7 per cent. The coal saving was 4.2 per cent, since in 1902 the tonnage was handled by 28.7 lb. (13 kg.) of coal per 100 ton-miles and in 1903 by 27.5 lb. (12.47 kg.) of coal per 100 ton-miles.

Furthermore 7 per cent more tonnage was handled by fewer engines, the saving being five engines out of 159, or 3.1 per cent. This item is of extreme interest during these

FIG. 1—ARRANGEMENT OF WATER SOFTENING AND PURIFYING TANKS USED BY ONE CENTRAL STATION

isil or turbine out the deposit. The question is how much fuel scale really wastes and whether the waste is efficient to warrant the investment in a water-softening plant to prevent the formation of scale.

PREVIOUS PUBLISHED DATA ON SAVINGS

Published experimental data on this subject are not in great abundance. Between 1898 and 1908 the engineering experiment station of the University of Illinois ran a series of tests on a locomotive and on individual boiler tubes in order to throw some light on the subject, publishing the results in its *Bulletin* 11 (1908). The locomotive, taken from the Illinois Central Railroad, was run with about $\frac{3}{64}$ in. (1.19 mm.) scale on it for about twenty-one months. Then the engine was cleaned and run for two days clean. The loss, based on equivalent water per pound coal evaporated at 212 deg. Fahr., amounted to 9.6 per cent.

*Volume 6, 1905, pages 597-611.

days of scarcity in the supply of trains and locomotives.

Besides the above, there are a number of benefits difficult to evaluate but extremely important as having a bearing on power-plant practice. For instance, there was a saving in time for engines to make their trips, due to fewer failures and therefore less expense for overtime labor and fewer delays for repairs on the road.

The results of eight years' use of softened water on the Southern Pacific Railroad system show a saving of 50 per cent in the expense of boiler repairs.

The average monthly locomotive mileage on the Union Pacific system has increased 27 per cent since the installation of the water-softening plants. Freight-train statistics also show "an increase in ton-miles per pound of coal of $7\frac{1}{2}$ per cent and a decrease in cost of repairs per locomotive mile of 34 per cent." The saving in repairs can be seen from the increased life of flues. "The average life of a set of flues in passenger locomotives with hard water was six months; since softening the water the average life is two and one-half years."

The committee's report in conclusion attempts to describe the general water conditions under which water softeners would produce savings by stating that "it would be a benefit to soften water used in locomotive boilers that contains 15 or more grains per gallon of hardening matter, or even less than 15 grains, if the hardening matter consists largely of sulphate of lime."

There are several cases in the writer's own experience, however, which illustrate the possibility of severe operating losses with a water having a hardness far below the committee's limit of 15 grains. A few weeks ago the chief operating engineer of one of our largest chemical manufacturing companies described to the writer conditions in one of its mills using the Delaware River water, having a hardness of between 3 and 4 grains per gallon in its eight 500-hp. horizontal water-tube boilers. The engineer of the plant showed tube charts which gave the average life of the tubes as six to eight weeks. The boilers were in constant danger of shut-down owing to tubes suddenly failing, and in several instances there was serious loss of life. The condition was due entirely to scale, which seemed to collect in sufficient quantity in tubes to prevent circulation and so cause overheating, blistering and bagging of the tubes. This same condition is probably familiar to other users of boiler-feed waters just as soft as the Delaware River wherever the boilers are operated at high overloads continuously. A boiler operating at 200 per cent rating with a 4-grain water has just as much scale deposited in it in the same period of time as a similar boiler operating at 100 per cent rating on an 8-grain water.

BENEFITS REALIZED BY OTHER CENTRAL STATIONS

That the installation of a water softener is warranted even with very soft natural waters is borne out by two other instances: A central station in Brooklyn, N. Y., installed a water-softening plant to obtain

water of zero hardness three years ago on the city supply of only 2 to 3 grains per gallon of hardness. The boilers (about forty of various types) develop a total of about 25,000 hp. and are run at high overloads during the peak periods. The use of the zero water has kept the boilers in such condition that these extreme peak ratings can be maintained with reliability and security at all times.

By installing the water softener this central power plant undoubtedly saved an investment for additional spare boilers which would be necessary to take up the load quickly in case of failure of some of the units in operation and actually saved about 50 per cent of the original investment in the cost of boiler repairs and the large amounts of soda ash formerly used directly in the boilers.

In a large textile plant at Bridgeport, Pa., using the Schuylkill River for its water supply (hardness, about 5 to 8 grains per gallon) the results of the first four months' run on "zero water," as compared with the same months of the previous year, showed a monthly saving in coal of 100 tons to 200 tons, compared with a consumption on hard water of 600 tons to 800 tons. The boiler plant consists of ten 150-hp. horizontal return-tubular boilers, the total horsepower developed being 1700. The same months in both years were chosen because the load was approximately the same during both periods.

It is interesting to note that the saving increased steadily during the four months in question because the scale was not completely removed when the water softener was started in operation. During the first month the saving was 102 tons, second month 166 tons, third month 208 tons, fourth month 216 tons. The soft water removed the old scale gradually, and the decreasing amount of scale present caused a corresponding decrease in coal used.

The old standards and ideals adopted for the quality of feed water are changing. The practice of maltreating boilers by using any water in them, then "doping" the boilers with some compound or soda ash and periodically cleaning the boilers with chisel and hammer is a thing of the past. With boilers costing to-day \$35 to \$40 per horsepower to install they are worth of the fine care and attention constantly given to engines. With the present practice of running boilers, especially in central stations, at 200 per cent to 300 per cent rating, and with the necessity for absolute reliability and certainty, the need for the best water with the least possible scaling contents is rapidly becoming realized.

The station operating committee of the N. E. L. & C. in describing the results obtained from a water softener in a large central steam company's plant in Manhattan operating on New York City supply of 2 to 3 grains per gallon, has this to say:

The results obtained develop a fact that is of great interest—that scale will form where boilers are operated at such high rating—200 per cent—if the water contains a hardness such as is usually obtained in the average water-softening plant. That is, boilers will not be free from scale if fed with a water of 4 grains hardness; therefore a greater refinement must be obtained to meet this condition. The demand for 200 per cent of rating is growing as more and more plants are being built to operate at that rating, and greater care will have to be taken to put into such boilers water containing the least possible hardness.

FIG. 2 — EXCHANGE - SILICATE
TYPE OF WATER SOFTENER

FEATURES OF VARIOUS SYSTEMS OF WATER SOFTENING

Lime-Soda Type.—In general there are two broad types of water softeners to consider. One is the lime-soda type, the other is the exchange-silicate type. The former consists of adding to the water lime and soda ash in fixed amounts depending on the chemical analysis of the raw water, allowing the dosed water, thoroughly mixed with the chemicals, to settle in large tanks, and then clarifying the settled water. This may be done with the water in a cold condition or by using a heater in advance so that the chemical reactions take place with hot water. The heater softeners permit of a smaller settling tank than the cold treatment, and the softened water if properly treated may have about 3 grains per gallon of hardness instead of the cold softened water of about 5 grains. But unless there is sufficient exhaust steam available to produce a temperature of over 200 deg. Fahr., there is no economy in the heater softener over the cold type because of the rapid radiation of heat from the large exposed area of the surface of the hot settling tank and separate hot filter. Furthermore, the washing of the filter and blowing off of sludge from the hot settling tank causes considerable loss of heat in the hot water wasted down the sewer.

The cold type of lime-soda softener may either be intermittent or continuous. The former consists of two or more settling tanks and filters with one tank being filled, dosed with the correct charge of chemicals, and then agitated in order to mix thoroughly while the other tank or tanks are settling and being used. The advantage of this type is that with waters of variable chemical composition the charge of chemicals may be suited to each tankful correctly. But the intermittent type naturally takes up a relatively large space and the foundations are expensive.

The continuous type feeds the chemical continuously into the water, which enters the settling tank at a constant rate, settling and then filtering, the water passing from chemical feed to filter without stopping. This type is as responsive as the intermittent with the average water supply where the chemical composition changes gradually, so that by analyzing the raw and treated water once a day the correct charges may be prepared for the day.

With all types of lime-soda water softeners the important things to watch are the size of the settling tank, the size and type of the filter and the allowable causticity in the treated water. In competition the size of the main parts naturally determines the cost, and unless these sizes are specified, competitive bids cannot be compared. It is just as necessary to check up a manufacturer's specification of a water softener as, for example those of a pump. With lime-soda softeners it is absolutely necessary to have a sufficient reaction and settling time to permit the chemical reaction to take place. If the settling period¹ is cut down, these chemical reactions take place after the water leaves the water softener, and clog up heaters, piping and boilers with the resulting precipitates.

Secondly, the filter should be of quartz and not of felspar or some other medium. Sand grains catch the precipitate best and can be easily washed by reversing the flow. The filters should be designed large enough to permit a low rate of filtration,² otherwise the precipitates may slip through.

As regards the allowable hydroxide causticity in the softened water, a limit should be set for this of about 2 grains per gallon, expressed as CaCO_3 . If no limit is set, it means that the water may be overdosed to get the guaranteed hardness. This overdosing is expensive with soda ash at 3 to 4 cents per pound, and a high causticity leads to other difficulties in boiler operation.

Exchange-Silicate Process.—The exchange-silicate process of water softening is a radical departure from the lime-soda type. The water is passed through a bed of granular insoluble sodium-aluminate-silicate, and all of the calcium and magnesium are exchanged for sodium. The exchange silicate takes the calcium and magnesium and in exchange gives its sodium to the water. The reactions are direct ex-

changes just as take place with soda ash in the lime-soda water softener. But the exchange silicate, being insoluble, is present in such high excess that all of the hardness is removed and a water of zero hardness results.

As explained previously, the addition of lime and soda ash reduces the hardness to 3 to 5 grains, and a causticity in the treated water results from the excess of soluble chemicals which was added to drive the reactions to those limits. Perhaps if the excess used and the resulting causticity were allowed to go high enough the hardness of the treated water might go lower. But with the exchange-silicate method the high excess is used and yet no causticity results because the silicate is insoluble. That explains why "zero" hardness water is possible by this method. The softening filters containing the exchange silicate are equipped with water meters, and when the designed capacity of a filter has been reached it is shut off and a solution of common salt or brine is introduced for about eight hours. This is called the "regeneration" period, and the salt solution restores the sodium to the exchange silicates, driving out the calcium and magnesium absorbed by the filter bed during the previous day's run. This salt is washed out and run to the drain in the morning, and the softening filter is then ready

FIG. 3—ONE TYPE OF LIME-SODA WATER SOFTENER

for another day's run. For continuous twenty-four hours' service two units are used in alternate service.

There are some waters, however, which can most economically be softened by a combination of the lime pre-treatment followed by the exchange-silicate filtration. This combination treatment has been strongly developed in England. In the United States also there are quite a few combination lime-exchange-silicate plants, especially in the Middle West. The advantage of the combination process over the single methods is found in large water-softening plants with waters containing a high temporary hardness of calcium and magnesium bicarbonates. The lime actually removes the temporary hardness down to several grains per gallon and so reduces the total dissolved solids in the water.

With waters of high permanent hardness, however, there is no advantage in the combination process because soda ash works by exchange on the permanent hardness just as the exchange silicates do. Furthermore about 3 lb. to 4 lb. (1.36 kg. to 1.82 kg.) of salt is needed for regeneration as against 1 lb. (0.45 kg.) of soda ash. With salt at 1/3 cent a pound and soda ash at 3 cents per pound the comparative cost of removing permanent hardness by the two processes would be 1 1/3 cents for the exchange silicate and 3 cents for the soda ash.

¹The city of Columbus allows eighteen hours' settling in the municipal water-softener.

²In the city of Columbus a rate of 2 gal. per square foot per minute is allowed.

INVESTMENT AND OPERATING COSTS

The comparative investments in different water-softening systems depend entirely on the composition of the water. Lime-soda plants remain fairly constant in cost with varying compositions, whereas exchange-silicate plants increase in size and cost with increase of hardness in the raw water. Cost of treatment depends also on the water composition and the proportion of temporary and permanent hardness. The cost of lime treatment alone is about one-third to one-half the cost of the corresponding salt for regeneration, but, as pointed out in the foregoing, the cost of the soda-ash treatment is about three times the cost of salt for regeneration. In conclusion, a typical case will be analyzed to determine the actual savings that would result from installing a water softener without reference to the type used. Take a water of the following composition (same as water in the Bridgeport installation mentioned above):

		Grains per Gal.
Total hardness,	as $\text{CaCO}_3 = 130$ p.p.m.	= 7.7
Calcium hardness,	as $\text{CaCO}_3 = 80$ p.p.m.	= 4.7
Magnesium hardness,	as $\text{CaCO}_3 = 50$ p.p.m.	= 3.0
Alkalinity,	as $\text{CaCO}_3 = 80$ p.p.m.	= 4.7
Temporary hardness,	as $\text{CaCO}_3 = 80$ p.p.m.	= 4.7
Permanent hardness,	as $\text{CaCO}_3 = 50$ p.p.m.	= 3.0

Assuming a boiler plant of 3000 hp., consisting of ten boilers with no returns using 12,000 gal. (45,400 l.) per hour raw feed water, the first cost including foundations and connections would be about \$20,000. The cost of operation for chemicals would be about 3 cents per 1000 gal. (3785 l.). With a coal consumption of 1 lb. (0.45 kg.) per 8 lb. (3.62 kg.) of water evaporated, the average daily consumption of coal would be about 150 tons. Assuming a price for coal at \$4 per ton and a saving of 5 per cent for fuel, then the fixed and operating charges of water softener would be

288,000 gal. per day \times 3 cents	= \$8.64	Per Year	= \$3,150
Labor of operation			= 500
Interest and depreciation, at 10 per cent			= 2,000

Total..... \$5,650

SAVINGS:

Coal—150 tons \times 5 per cent = $7\frac{1}{2}$ tons per day = 2740 tons per year, at \$4.....	= \$10,960
Cleaning boilers.—Assuming that the boilers were formerly cleaned six times per year and are now only inspected, six cleanings saved, at \$30 per boiler, $6 \times \$30 \times 10 =$	1,800
Tube saving and repairs.....	1,000

Total	\$13,760
Deduct	5,650

Net saving

Therefore the return on investment = $\$8,110/20,000 = 41$ per cent, or the plant would be paid for in two and one-half years out of the savings.

If the plant were operating condensing at considerably above normal rating, as is usually the case in central stations, the net saving would be much greater and the softener would pay for itself more quickly, probably inside a year. This statement is based on the assumption that the percentage saving in fuel is the same in both cases and does not take into consideration the value of having more reliable service, the avoidance of damage from bursting tubes, the expense of shut-downs, or the investment otherwise required in reserve boilers. Each case should be studied individually and the water analyzed by a chemist.

TELEGRAPHS AND TELEPHONES
IN THE FIRST YEAR OF WAR

Extensive Communication Facilities of the Country
Are Fully Organized for War Service to
the Nation

BY JOHN V. L. HOGAN

Vice-President Institute of Radio Engineers, Commercial Manager
International Signal Company

SINCE the United States went to war the communication systems have been concerned mainly with establishing and maintaining their business and personnel upon a war basis. Naturally enough, the wire telephone and telegraph systems and the cables, as well as radio-telegraphy, have been strongly affected. Probably the greatest changes have occurred in the radio or wireless field, because of the peculiar utility of that mode of signaling for various military purposes.

WIRE AND CABLE LINES ACTIVE

On the whole, the wire and cable lines are carrying on "business as usual," except for the difficulties introduced by the loss of the trained civilian staff to the signal services of the army and navy and by the necessity of giving precedence to the immensely increased government traffic, which has grown in volume so rapidly. The telegraph companies have found it desirable to re-employ retired operators who had given up work at the Morse key. Many additional women employees have been placed in operating, clerical and supervisory posts formerly occupied by men. It seems likely that the desire to hold down plant expenses during unsettled times will be overbalanced by the scarcity of skilled operators, and that, consequently, the use of automatic and printing telegraphs will increase. Up to the present the installation of these modern and effective traffic channels has been limited to intercity lines over which abundant message business could always be had, since their expense seemed justified only in these instances. Looking ahead, however, the indications are that the quantity of available traffic will cease to be the only determining factor.

Increased use of the printing telegraph is also favored by the recent independent developments of devices in which much of the complication and expense of the older systems is avoided. The day is at hand, if not actually here, when keyboard transmitters and automatic type-writing receivers may be plugged in at the terminals of any normal simplex or duplex line and thereafter operated by untrained clerks at a message speed greater than that attained by the best hand Morse operators. The invention and perfection of machines whose operation is substantially independent of line conditions makes it feasible for a main office to use three or four sets of automatic apparatus for a dozen or more trunks, clearing congested traffic as necessity arises.

The telegraph systems of the country have become more heavily loaded in at least two ways—(1) because of the growing need for quick communication which results from the large amount of war-time production, and (2) on account of the daily increasing delays in the mails, which, of course, enforce larger use of telegraphic messages. On the other hand, telegraphic traffic is cut down by the natural stimulus to economy which accompanies uncertain financial conditions and also by the increased urgency which in many instances

necessitates telephonic communication, even at increased cost. Just how these several factors will finally affect the general traffic load cannot be determined until detailed message reports are available, but it seems likely that a marked growth in telegraph business, and especially that of the "night letter" classification, will be found.

Uncertainty in transatlantic mails, the essential close co-operation between our government and those of our European allies and the diversion of long-distance wireless stations for military uses have all tended to increase cable traffic. More stringent censorship regulations, which add to the burden of the cable staff, have come as a natural result of the state of war. However, nothing abnormal has been reported in the way of interruptions (perhaps because of the scarcity of enemy raiders left at large), and, in its entirety, the cable business seems to have been little changed. Certain technical advances, including the practical use of selenium and other relays, have been continued throughout the year, but no particularly sensational improvements have been announced.

HEAVY DEMANDS ON THE TELEPHONE SERVICE

Commercial long-distance telephony has suffered since the beginning of the war. In spite of careful plans for keeping essential members of the plant and operating organizations at their normal posts, on account of their value to the government communications in their usual daily work of providing good intercity telephone services, it is reported that so many have entered the Signal Corps and naval communication department that the telephone companies are actually handicapped. Moreover, a large number of long-distance trunk lines have been turned over directly to the government and are used entirely for official conversations. These are lost to the commercial service, since they have not been completely replaced by new lines in proportion to an increasing volume of long-distance traffic. Thus the usual business message service is not only somewhat poorer than in the past, but it also appears to be subject to more frequent and longer delays in times of storm. In consideration of the tremendous work the telephone organization is doing directly for the army and navy, however, the "non-essential" (from the war work viewpoint which must prevail to-day) uses of the telephone are in fact limited only very slightly.

The tremendous expansion of local government telephone service in large cities, and particularly in Washington, has crippled normal work to a considerable extent. New telephone instruments have been called for in such large quantities that companies have been forced to refuse to extend many private installations. Increased demands upon central offices and the larger private branch exchanges, as well as the withdrawal into military service of many men switchboard operators, have brought a large number of inexperienced girls into the work, and this naturally increases confusion and delay despite the best efforts of the companies. Without a doubt readjustments of plant and employees will relieve current difficulties where they are now most evident, and the telephone companies deserve full credit for the way in which they have continued to perform their important duties.

An interesting and relevant topic in connection with telephony is the extension of women's work into the

positions formerly held almost exclusively by men. Telephone companies have always had large numbers of women employees; but in common with many other industries they have not been fully cognizant of the availability of women for positions requiring long and technical training. It is most significant, though not generally known, that the complicated mathematical operations involved in transmission and other problems considered by the telephone engineering departments are worked out largely by women who specialized in mathematics at college and were employed thereafter as computers.

GREAT CHANGES IN WIRELESS FIELD

War conditions have brought great changes in the wireless-telegraph field. In the first place, all commercial shore stations were closed by order of the President immediately after the United States entered the war. This put a stop to actual and anticipated international and overland radio traffic. Wireless outfits were permitted to remain in operation on shipboard as a matter of safety to passengers and cargoes, but communication has been limited strictly to necessary position reports, warnings and similar maritime matters, all of which are sent in cipher. The Navy Department maintains a chain of land wireless stations along the shores of the country and has extended its service to comprehend essential commercial radio traffic, but since this must be entirely subordinated to governmental affairs the total number of private messages is extremely small.

In taking over and building many cargo ships the government has also acquired the ownership, control and operation of the radio apparatus upon them. Some hundreds of vessels using a large Eastern port are now entirely in the hands of the naval radio service as regards the inspection and maintenance of their radio apparatus and the supply of operators for them. The various wireless companies have largely become manufacturers for the army and navy, since their operating and research branches cannot continue on anything approaching the pre-war basis. Development of new inventions is directed almost entirely toward their utility in war work, and only those which are of the greatest actual or potential value to the military and naval services can justly be given full attention.

GRATIFYING ABSENCE OF WASTE

In view of their immense value and importance it is only natural that the communication facilities of the country should be so fully organized for war service, but it is especially gratifying to see that the radical changes in policy and operating methods throughout the several systems for transmission of intelligence have caused so little waste. So far as can be seen, the cable and wire channels will grow to be of even more utility to the government without seriously reducing their commercial value. The commercial future of radio, however, seems to be dependent largely upon its general technical development, and consequently the present period of military domination must be looked upon as a necessary setback resulting from the availability of wireless communication as a weapon. When the great war is won and conditions are more normal again, the useful future of radio signaling will come into sight once more, and this newest of the communication arts should progress rapidly to its fuller development.

Application of Motors to the Textile Industry

Increased Production Possible with Motor Drive Tends to Reduce Mill Investment per Unit of Output—Factors Affecting Selection of Motors and Control Apparatus

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

A brief statement of the power situation in the textile industry in reference to the increasing use of motors for this class of machinery. Types of motors now commonly employed are described, with notes on the control auxiliaries in standard practice; the economic advantages of the adoption of motors in preference to steam or water power are dwelt upon, and the principles outlined in the article are illustrated by reference to actual installations where examples of both belted and directly coupled motors are found.

THREE factors stand out prominently in the cotton textile industry that have an important bearing on the application of motors in this field: First, the enormous increase in the value of the products during the last fifty years; second, the large capital invested,¹ which makes a high rate of production essential to the economical operation of such plants, and, third, a decreasing proportion of water power used in terms of the total power together with an unusual increase in the use of electric power.

In the earlier days of the cotton-textile industry water power was the largest source for driving purposes, forming about 60 per cent of the total in 1870, with steam power about 40 per cent. In 1910 water power dropped to about 20 per cent of the total, steam power increased to about 60 per cent, and the remainder was largely electric power. Beginning about 1900, therefore, and with a rapidly increasing growth, elec-

FIG. 1—EXAMPLE OF DIRECT-CONNECTED MOTOR DRIVE IN A SPINNING ROOM

tric power has been applied to textile machinery, this growth being so marked that Rickards² has estimated roughly 40 per cent as the probable proportion of elec-

tric power to be used in this industry two years hence.

To show the place held by the motor in the textile industry, the limitations experienced with the operation of these plants by mechanical means from steam and water power will be cited. Utilization of water power, which was a general method in the earlier

FIG. 2—INCREASE IN VALUE OF COTTON TEXTILE PRODUCTS

plants, usually made it necessary to locate mills at points inconvenient for shipping and resulted in a less flexible arrangement than when other motive power were employed. If the wheels are at one end of the mill, the long-line shafting thus required introduced high friction losses and other mechanical difficulties.³

The more flexible arrangements possible with a steam plant, its adaptability to central locations by which shafting may be extended on either side of a central tower, and the ability it gives to locate the plant at a point convenient for shipping make it a more favorable source of supply than water power. These advantages, together with the improvements of steam engines in recent years, have resulted in a considerable increase in the use of steam power, with a corresponding decrease in the growth of water-power plants.

Both of these sources, however, require mechanical transmission, and the exacting requirements of certain machinery, like looms, which must be stopped and started up under full load continuously, impose severe stresses on the belts connected with such drives. Added to this are the effects of speed regulation and presence of dirt, which may fly off from the belts, etc., on the quality of the product. In these directions motor drive has proved its superiority over the other power sources.

The motor has thus gained much headway in the

¹In recent years the amount of capital required per unit of output value has decreased, indicating that manufacturing efficiencies have increased.

²See *Electric Journal*, Vol. XI, No. 7, p. 404. Fig. 2 has been drawn from information in this article, and other references are made to it in this discussion.

³The reader is referred to a treatment of power in textile mills by William W. Crosby, "Standard Handbook for Electrical Engineers," fourth edition, p. 1267, to which several references have been made in the preparation of this article.

field as an aid to accuracy and uniformity in the manufacture of a more or less delicate product. The reduction or entire avoidance of speed fluctuations is a factor entering into both the quality and the quantity of the output. As usual in electrical developments of this kind, much effort has been expended by the motor and

Squirrel-cage induction motors are well adapted to the conditions because of their simplicity of structure and the absence of a commutator. Motors of this type, as used for textile work, are designed for operation at reasonably low temperatures and uniform speed and possess high efficiency, high power factor and low slip.

FIGS. 3 AND 4—SEVERAL TYPES OF TEXTILE-MILL MOTORS

control manufacturers to design motors and control apparatus with characteristics which adapt them to the particular machinery to be driven. In the following paragraphs, therefore, the principal points to be discussed are those which relate (a) to the types of motors now available for such service, (b) to interesting aspects of modern control apparatus for textile motors, and (c) to cases selected from actual practice which illustrate given motor applications.

From some standpoints the direct-current motor might be looked upon as suitable for textile machinery,

The practice of one leading motor manufacturer is to list these motors in two groups,¹ one group having a starting torque of at least three times full-load torque, and the other having starting torques ranging from one and one-quarter to two and three-quarters times full-load torque.

The slip for motors of this class varies somewhat with the service to which they are applied. Where uniform speed is required the motor is designed for a slip of about 4 per cent at full load. However, where the motors seldom, if ever, operate at less than half

FIGS. 5 AND 6—FOUR-FRAME BELT DRIVE AND INDIVIDUAL MOTOR DRIVE WITH GEAR CONNECTION

at least in many cases. The presence of lint and dust in the air, however, has had a tendency to increase the use of induction motors for such service. The constant deposit of dust and lint in the crevices of the motor and in uncovered bearings is such a serious objection that motors have been designed for the complete protection of the interior of the frame, the windings, bearings and oil wells.

load the actual gross speed variation is thus only about 2 per cent.

The tendency in the application of these motors is

¹Catalog 3002, Section 1, p. 44, Westinghouse Electric & Manufacturing Company. Figs. 3 A and B, 5, and 7 A, B, C, E and G are shown by courtesy of this company; Fig. 4 A, of the Wagner Electric Manufacturing Company; Figs. 7 D and E, of the Crocker-Wheeler Company; and Figs. 1 and 6, of the General Electric Company. Data and other information have been contributed by these companies.

for individual drive, which possesses decided advantages over the group method. Sometimes, however, a single motor may be used for driving a group of textile machines according to the usual group method, as shown, for example, in Fig. 5. In a case of this kind it is unnecessary to use line shafting.

In addition to the general precautions taken in the design of textile motors, as outlined above, for preventing the accumulation of dust and lint on operating parts of the motor, consideration is also given to other peculiar conditions found in the various departments of textile mills. Among them are the fire risk in picker rooms, the presence of acid fumes in the dye house, etc.

Typical loom motors are adapted also to such cases as warpers and winders, and special types are available for the class of machinery typified by the picker and

with its own individual motor, but the entire series controlled from one point.

Where starting conditions permit, synchronous motors may be used in conjunction with the standard induction motor equipment, a feature which is specially desirable in case the power factor of the induction-motor circuits is low.

The advantages of the motor depend to a considerable extent on the control facilities available. For individual drives a non-automatic "quick-make-and-break" oil switch (Fig. 7G) may be employed. The protective features of standard textile switches include overload protection only in some cases, low-voltage protection only in others, and both features in still others.

For frequent starting and stopping, and also where push-button operation is required, the practice is to

FIG. 7—DIFFERENT TYPES OF TEXTILE MILL MOTOR CONTROLLERS

the roving frame. To meet particular conditions in yarn mills the double-extended shaft and the four-frame-drive have made it possible to drive four machines from one motor without line shafting.

Finally, some cases are found, as in finishing processes, where different qualities of goods worked upon call for different speeds. In such cases either the direct-current adjustable-speed motor or the wound-rotor alternating-current induction motor is used. The former is preferable where wide ranges of speed are necessary and also in cases where a number of productive machines are arranged in series, each equipped

make up regular contactor panels for the condition of any given case. In those mills where central-station power is purchased rules of the power company may not permit the starting of induction motors by throwing them directly on the line. In such cases starting switches like Fig. 7G may not meet the requirements and an auto-starter becomes necessary. With the starters overload and low-voltage protection is available, together with arrangement for conduit. Where direct-current adjustable-speed motors are used for series of productive machines operated from a central point automatic or semi-automatic control is advisable.

The agitation in the press at the present time concerning the textile situation places unusual emphasis on the small margin of profit derived by such concerns in comparison with some other industries. This being the case, there is every reason for the manufacturers of textiles to investigate each possible channel through which increased production may be realized for given manufacturing expense. Recent data indicate a rapid increase in the adoption of the motor for textile mills, and those responsible for the power supply will do well

to take advantage of the developments which have been made in the design of motors and control for the various classes of machinery which are met with in plants of this description.

The experience of the immediate past points to a gradual reduction in the capital required per unit of manufactured value of textile products. Every per cent of reduction along this line means just so much more leeway for the operators in profit margin, and the possibility of improving wage conditions.

A Study of Electric Range Efficiency*

Results Obtained by Means of Tests Made on Both Open and Inclosed Heating Units with Different Kinds of Utensils, as Well as from Experiments with Ovens of Different Size

BY R. G. KLOEFFLER

Assistant Professor in Electrical Engineering, Kansas State Agricultural College

AN INCREASED interest in the efficiency of the electric range has recently become evident. This has been the natural result of the widespread introduction of this modern cooking appliance during the last three years. The cost of operation is the thing which interests the prospective owner of an electric range and the central station supplying the electrical energy. The cost of operation and efficiency, however, are almost synonymous when applied to electric cooking.

In order to determine the efficiency and practicability of the electric range a series of tests was carried on during 1917 in the electrical engineering laboratories of the Kansas State Agricultural College. The important results of this investigation are presented below. Details of these tests and complete data will be published in *Bulletin No. 9* of the Engineering Experiment Station of the Kansas State Agricultural College.

SURFACE-HEATING UNITS

The efficiency of surface-heating units was obtained in a simple manner, as follows: One quart (0.94 l.) of distilled water at a temperature of 60 deg. Fahr. (15.6 deg. C.) was placed in a covered dish upon a unit. Current at a constant potential of 110 volts was turned on the unit (beginning cold) until the water rose nearly to the boiling point (206 deg. Fahr., or 96.7 deg. C.) as registered by a mercury thermometer. At the same time the energy consumption was recorded by a standardized watt-hour meter. The energy in B.t.u. utilized is the product of the pounds of water and the change in temperature, while the energy input (B.t.u.) is the product of kilowatt-hours and the constant, 3415. Efficiency = [pounds water \times change in temperature (Fahr.)] \div [3415 \times kilowatt-hours].

If the water should reach the boiling point and boil for some time, the efficiency could be again obtained with fair accuracy by reweighing the water and adding to the previously computed absorption that required to change the water into steam; thus: Efficiency = [pounds water \times change in temperature + pounds

evaporated \times latent heat of evaporation] \div [3415 \times kilowatt-hours].

According to these methods, the efficiencies of the surface units on eight different electric ranges were computed. Seven of these units are shown in Fig. 1. The eighth was omitted because of the difficulty in classifying it for the general work of comparison. The three units at the top of Fig. 1 are of the inclosed or disk type. The lower units are of the open or radiant type.

It might be expected that the efficiency would vary with the size, color and material of construction of the utensil used in the tests. In order to get an average value for such variations and also to get the data for desirable comparisons, the following utensils were

FIG. 1—INCLOSED AND OPEN UNITS FOR ELECTRIC RANGES

chosen: a small bluish-gray granite kettle having a diameter of 6 in. (15.2 cm.) on the bottom; a small aluminum kettle 6 in. (15.2 cm.) in diameter called "new" in this article since it had a bright, new luster and a perfectly flat bottom; a small aluminum kettle same as above except that it was discolored with use and dented at the bottom (called old); an aluminum fireless cooker pan 8 in. (20.3 cm.) in diameter and having a perfectly flat bottom (called new); an agate granite pan and a white granite pan each having a diameter of 8 in. (20.3 cm.) on the bottom. All of the above utensils were fitted with suitable covers before the experiments began.

The efficiencies on the seven units illustrated are

*Copyright, 1918, by R. G. Kloeffer.

condensed into Tables I, II and III for the purpose of specific comparisons.

Table I gives the values of surface unit efficiencies for granite and new aluminum utensils on the open and on the inclosed type of surface units. From the average percentages it is observed that the open type has 4.9 per cent more absolute efficiency when used with

Inclosed	53.3	37.8	48.7	43.75	50.3	63.5
Inclosed	37.1	25.2	51.9	51.5	57.5	72.9
Average	42.3	28.6	50.9	45.9	55.9	68.1
General average	46.97	40.35

granite than with aluminum utensils. This figure relative to the efficiency with aluminum makes the granite utensils 12.7 per cent more efficient.

For the inclosed type of unit, however, the reverse of the above is true, and the average percentages show that the new aluminum utensil gives an 8 per cent higher absolute efficiency than the granite. This value in terms of relative efficiency makes the aluminum utensil 20.7 per cent more efficient. For the purpose of easier comparison the results of Table I are plotted in the chart (Fig. 2).

These facts can be explained in the following way: The open-type units give up their heat principally by radiation, though some convection and conduction will take place. On the one hand, the granite dishes will readily absorb the radiated heat, while the aluminum, if bright, will have a tendency to reflect the radiated heat downward again. On the other hand, the inclosed unit gives out most of its heat by conduction, with smaller amounts emitted by radiation and convection. Here the granite dish, because the coating of enamel is a poor conductor of heat, does not receive the heat readily while the aluminum dish, since aluminum is an excellent conductor of heat, acts more efficiently.

Columns 2 and 3 of Table II give the efficiencies on an old and a new 6-in. (15.2-cm.) aluminum utensil. For the open type of unit the new aluminum utensil has an average absolute efficiency of 2.45 per cent more

than for the old, and therefore the former is relatively 7.75 per cent more efficient. This percentage is to be contrasted with that of the inclosed group of units, where a difference of 13.7 per cent in absolute efficiency is noted; that is, relative to the old aluminum utensil the new one is 48 per cent more efficient. The efficiencies of this part of the table for the old aluminum utensil are also plotted in the chart of Fig. 2. It will be observed that the second open type of unit has a slightly higher efficiency with the old aluminum utensil than with the new one. This occurs because this unit, being of the reflector type, will absorb the heat more readily from the darker-colored utensil bottom. A study of Fig. 2 gives the inclosed units the maximum of all the efficiencies obtained, when used with the new aluminum utensils, but the big reduction in comparative efficiencies as the bottom of the utensil becomes discolored and dented offsets this advantage.

Columns 4 and 5 (Table II) show the efficiencies with and without a cover on the utensil. For the open type of unit the cover adds an average of 23.7 per cent to the relative efficiency; for the inclosed type the relative efficiency is increased by an average of 10.9 per cent, and for all seven units the average increase is 16.4 per cent.

Columns 6 and 7 of this table contain the computed efficiencies when, after being heated for thirty minutes, the utensil remains on the unit until the boiling of the water has ceased. A study of the averages here reveals that the inclosed units give the higher values, which might be expected since the heat stored in the

iron mass of the inclosed unit will be readily given up by conduction.

The first section of Table III gives a comparison of an agate, a dark-blue and a white granite dish, all containing 2 quarts (1.9 l.) of water. It might be expected that the color of the enamel would affect the amount of heat absorbed, particularly on the open type of unit. The results seem to bear this out, though the

difference is rather small. This does not explain the same difference found in the case of the inclosed unit. The last column in this section gives the efficiencies on the blue pan when 3 quarts (2.8 l.) of water are used. As expected, the efficiency increases with the quantity of water and the time required for a given change of

FIG. 2—CHART PLOTTING PART OF TABULATED DATA (TABLES I AND II)

temperature. The average increase in efficiency here is the same for the open and for the inclosed type of units.

The second section of this table compares the efficiency and time required for a given rise of temperature of 2 quarts (1.9 l.) of water on 1100-watt and 1500-watt units. The average of the results shows that

a bright new reflector and the discolored, dirty reflector which results from use. The average for four utensils on two different units shows a decrease of 6.3 per cent in relative efficiency after being in service for a time.

Thus far consideration has been given only to the efficiency obtained on raising the temperature of water from 60 deg. to 206 deg. Fahr., which requires from fifteen to twenty-five minutes. It would also be of interest to know how the efficiency has varied from the beginning, and to get this variation in efficiency readings of temperature and kilowatt-hours were taken at three, six, ten and fifteen minutes from start on two of the utensils tested. From these values the efficiencies were computed according to the method previously described, and they have been plotted in curves of Fig. 3.

With the new aluminum utensil both the open and the inclosed units have an average efficiency of about 17½ per cent at the end of three minutes. Beyond the three-minute point the efficiency of the inclosed units rises very rapidly, approaching a maximum in about fifteen minutes. The curves on the granite utensil show that at the end of three minutes all the open type of units have about 22½ per cent efficiency, while the average of the inclosed type at the same period is only about 7½ per cent. It takes about eight minutes for the inclosed type to reach the efficiency obtained by the open type at the end of three minutes. The open-type units rise to an average of nearly 40 per cent in the first ten minutes. The particularly rapid rise of unit C to almost a maximum in ten minutes should be noted, since there are some hasty operations in the kitchen where the surface unit may be in use for only five to eight minutes. This is more especially true where hot

FIG. 3—CHART PLOTTING EFFICIENCIES AT STATED INTERVALS OF TIME

about three minutes in time is gained at a sacrifice of almost 12 per cent in efficiency by using the larger unit. Hence an effort to hasten results by using a surface unit of the higher wattage will increase the cost of operation.

The last section of Table III brings out the difference on units of the reflector type in efficiency obtained from

water is available at the tap. For such operations obviously the surface unit with the higher efficiencies obtained in a short time has a decided economical advantage.

In a future issue of the ELECTRICAL WORLD data and tables on the performance of electric ovens will be printed.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

INTERESTING INSULATION

TEST ON STEAM DRUMS

Experiment Showed that with Proper Heat-Insulating Material a Saving Resulted That Paid for This Extra Insulation

An interesting test for determining loss of heat by radiation from boiler settings and steam drums was recently made by C. A. Eastwood, superintendent of Station A, Pacific Gas & Electric Company, San Francisco, Cal. For the experiment a 560-hp. B. & W. boiler was selected, the steam drums of which were covered with one course of common brick. A rectangular can containing a measured quantity of water was placed on top of one drum and the boiler was run at its rated capacity for a period of three days. During this time the rise in temperature of the water was carefully noted.

To determine how much of the fuel loss could be saved by the use of an effective heat-insulating material, one 2½-in. (6.4-cm.) course of Armstrong nonpareil insulating brick was then placed on top of the common brick covering and readings were taken as in preceding tests. The result showed that with the nonpareil brick in place the loss of heat amounted to only 144 barrels of oil per year. With oil costing 70 cents per barrel, the saving amounted to more than enough to pay for the cost of the insulating brick and the labor required for installing it.

USE OF LIGHT-WEIGHT MOTORS A MEANS OF ECONOMIZING

Large Quantities of Copper and Steel Will Be Released Thereby for Other Purposes—
Freight on Light Motors Less

BY A. BRUNT

Engineer Westinghouse Electric & Manufacturing Company

Economy with all the resources of the country is of the greatest importance under the present conditions, it being just as important to economize with copper and steel as it is to economize with food and coal. In order to pay off the immense war debts it will be imperative for this country to make the best possible use of its resources. Of these copper and iron ore form very prominent parts. Economy in these metals must be made at every point, and no part of a machine should contain metal not necessary for its proper operation. By giving preference to lighter motors of equal rating users will encourage manufacturers to seek out means of economizing metals and thus release a very substantial amount for other uses.

Records of a prominent manufacturing concern indicate that the average-size direct-current general utility motor sold has a torque of 65 ft.-lb. (8.97-kg.-m.), corresponding to 15 hp. at 1200 r.p.m. This size of motor can be bought with a weight varying between 605 lb.

and 1080 lb. (274.4 kg. and 489.8 kg.) (Fig. 2). Assuming the average weight of motors of 65-ft.-lb. (8.97-kg.-m.) torque to be 845 lb. (383.3 kg.), and further assuming a total production in this country of 30,000 motors per year, the waste of material by using the average motor instead of the lightest motor will be $(845 - 605) \times 30,000$, or 7,200,000 lb. (3,265,865 kg.) per year. This figure is appalling, especially under present conditions.

Improvements in the design of direct-current motors—chiefly the adoption of the commutating pole, a more thorough knowledge of allowable operating temperatures and more effective means of ventilation—have made it possible for progressive manufacturers to reduce the weight of their machines very substantially (Fig. 1).

Since all manufacturers sell in the same market, their prices for motors of the same rating must necessarily be nearly the same. The purchaser of a motor natu-

FIGS. 1 AND 2—RELATION BETWEEN WEIGHT AND TORQUE FOR COMMUTATING-POLE AND NON-COMMUTATING-POLE MOTORS; ALSO FOR SEVEN VARIOUS MAKES OF MOTORS

rally will ask, "Should I buy the light or the heavy motor?" The motors will all be designed to have the same temperature guarantees, and, assuming that the speed characteristics will be satisfactory and the efficiencies equally good, it may be asked, What are the advantages of the one over the other?

Naturally many purchasers of direct-current motors will think that by buying the heavy motor they are getting more for their money. A careful comparison of the two motors, however, will show that this is not so. If the heavy motor should have more excess capacity, this should also show itself in dimensions of shaft and bearings. However, an examination of the pulley-end bearing diameter for two competitive lines of motors manufactured by prominent concerns shows that there is very little difference between shaft diameters of competitive motors.

The lighter motor necessarily must be the better ventilated one, which means that the motor is so con-

structed that the cooling air comes in thorough contact with those internal parts in which the heat is generated. Thus it follows that the excess of actual external temperature over the temperature measured by applying a thermometer to outside surfaces must be smaller in the light, well-ventilated motor than in the heavy motor, with consequent smaller danger of damage to the insulation. In this respect the light, well-ventilated motor is much to be preferred over the heavier one.

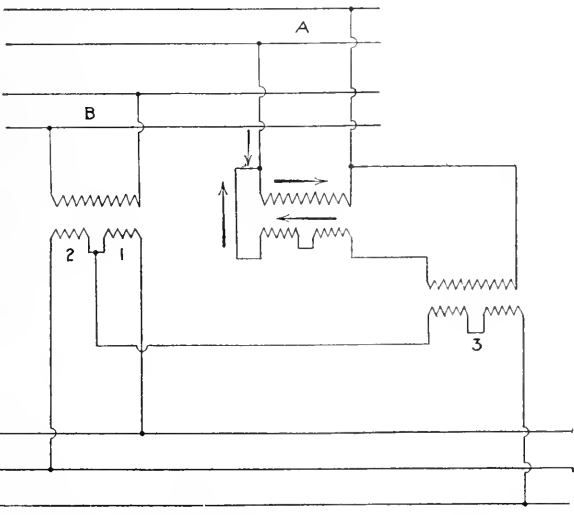

Light motors further can be handled more easily and also have a lower freight rate, which is an advantage to the purchaser in case the motor is to be shipped outside of a free-delivery zone. That great weight is not necessarily an equivalent of superior qualities is well illustrated by the weight curves of Fig. 1. Efficiency and especially commutation of the commutating-pole motor are decidedly superior to the same qualities of the very much heavier non-commutating-pole motor.

FROM TWO- TO THREE-PHASE WITH STANDARD TRANSFORMERS

Balanced Voltages by Connecting Two Transformers in T and Using a Third to "Buck" Voltage Across Unit Corresponding to Leg of T

BY E. CHARLES SEARS

Where two-phase service is supplied and three-phase energy is desired, but only standard transformers are available, the following plan can be followed: Assume that the primary voltage is 2200 and that 2200/220-110-volt transformers are available. Connecting the primary windings of two transformers across the two phases and joining the secondary of one transformer with the mid-point of the other transformer's secondary will not give balanced three-phase voltages, since the secondary windings do not have the proper number of turns, relatively, for T-operation. In fact, operating

METHOD OF CONNECTING THREE STANDARD TRANSFORMERS TO CONVERT FROM TWO-PHASE TO THREE-PHASE

the transformers mentioned above in T the phase voltages* would be 228, 261 and 261.

By connecting a third transformer across phase A to "buck" the primary voltage of transformer 3 by

*Based on actual measurements for a specific installation—voltages across windings 1 and 2 were both 114, while voltage across winding 3 was 235.

220 volts, however, the voltages across phases are made nearly equal, as shown by the following calculations: Voltages across both windings 1 and 2 were 110 volts and the pressure across winding 3 was 198 volts. Thus the voltage across windings 1 and 2 would be 220 volts, while both the other delta voltages would be

$\sqrt{110^2 + 198^2} = 227 \text{ volts.}$

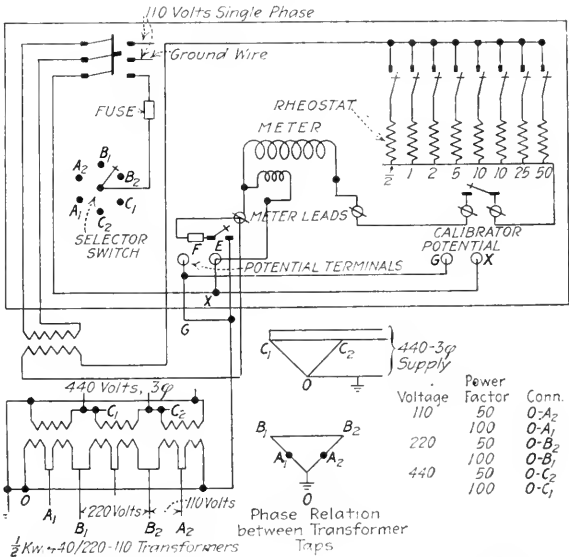

METHOD OF TESTING METERS AT TWO POWER FACTORS

Transformer Taps Provided to Give 110-220-440 Volts and 50 and 100 per Cent Power Factor—Diagram of Connections

BY JOSEPH N. M'CLURG

Foreman Meter Department Scranton Electric Company

The writer recently developed a meter-testing panel for testing single or polyphase meters of 0.5-amp. to 100-amp. ratings at 110, 220 and 440 volts. The panel

WIRING DIAGRAM AND PHASE RELATION BETWEEN TRANSFORMER TAPS

is of transite wood. The main switch is a 60-amp. single-throw, triple-pole instrument, and the load switches are 30 amp. single-throw, single-pole.. The load consists of old direct-current arc-lamp resistance coils connected with an old 5-kw., 2200/110-volt transformer operated at reduced voltage to obtain 20 volts on the secondary.

The selector switch gives 110-220-440 volts, 50 and 100 per cent power factor. The connections for giving different voltages and power factors are indicated in the accompanying diagram. Switch E is closed when testing single-phase meters, one potential lead being fastened to the line terminal of the series coil in the meter. This switch is opened if the potential coil is not joined with the current coil. It has individual terminals.

From the vector diagrams at the bottom of the illustration it may be seen that if the load current is in phase with vector OC₁, OA₁ or OB₁, 100 per cent power factor will be obtained by connecting selector switch with contact A₁, B₁ or C₁, the voltages being 110, 220 and 440 volts respectively. When connected with A₂, B₂ or C₂, however, the voltage is 60 deg. out of phase with the current, so 50 per cent power factor will be obtained.

SAFETY BULLETIN BOX FOR PREVENTION OF ACCIDENTS

Provides Receptacle for Suggestions, Display of Safety Council Bulletins and Opening for Lantern Slides

The United Gas Improvement Company of Philadelphia has developed the safety bulletin box shown herewith to attract the attention of its employees. In addition to serving as a receptacle for suggestions, the box provides a new arrangement for the display of standard letter-size safety-council bulletins. There is also a standard opening for lantern slides and descriptive notes, which are made prominent by a flashing light. The box is strongly made of light sheet metal and contains a flashlamp, double glass sides, necessary electrical connections and a short section of insulated

BULLETIN BOX FOR PROMOTION OF SAFETY

cable which may be extended through an insulated bushing at the upper corner on either side of the box. The exterior is enameled in safety green, and the interior is painted in aluminum. The box measures 12 in. by 22 in. by 20 in. (30.5 cm. by 55.9 cm. by 50.8 cm.).

THE TREMENDOUS FORCE EXERTED BY SHORT CIRCUIT

Conductors and Insulation Expelled from Sheath—Bulge Produced in Cable 150 Ft. from Point of Rupture

BY GEORGE W. TEFFEAU

Some indication of the enormous force exerted when a short circuit takes place close to a station was given recently when cable trouble occurred on the lines of a large Western company. In searching for the damage done a slight bulge was observed on the joint sleeve where the cable joined a submarine cable. The joint was opened and it appeared that the conductors had been crowded forward into the joint 2 in. (5.1 cm.).

On testing the damaged submarine cable from the street end it was found that the conductors showed all three legs short-circuited and grounded, while a test from the station end showed the three conductors short-circuited but free from ground, indicating that the cable had burned apart. Resistance tests indicated that the failure had taken place three-quarters of the way between the station and the street end. The cable was dug up at this point, the break discovered and the cable found to be damaged for a distance of about 4 ft. (1.2

m.), with no damage to adjacent cables. At the point of failure the lead sheath and steel jacket were badly ruptured, while on the station end the copper conductors with their paper insulation had been forced out of the lead jacket for a distance of 2 ft. (0.6 m.). The mighty force which caused the rupture was great enough to push the cable in its jacket of steel forward, causing the bulging in the sleeve referred to before. The distance between the failure and the sleeve was 150 ft. (45.7 m.).

TEST POINTS IN SERIES

CIRCUITS SAVE TIME

Installation of Test Points Required Modification of Trouble-Hunting Methods—Details of Methods and Instructions Given

Suitable test points in series circuits are time savers in trouble hunting. One central station which recently changed from inclosed carbon arcs to Mazda C units modified its overhead construction at the same time to minimize line trouble. The first improvement was the installation of absolute cut-outs at the lamps. This not only made patrolling and renewals safer but also permitted the service wires to each lamp to be pulled up tight permanently, since these wires no longer swung down when the lamp was lowered. As it was no longer necessary to provide for clearances with cross leads in lowering the service wires, vertical runs on poles were obviated and construction on poles was much simplified. Further safety was secured by the use of duplex feeds.

However, the new installation required a modification of trouble-hunting methods previously in force. Patrolmen looking for grounds or opens had made a practice of lowering an arc into the street, disconnecting a terminal and ringing out in the usual way to ground. The new absolute cut-outs precluded this method, and even where cut-outs were not installed it was impossible to trace back through the duplex feed. It was therefore decided to install test switches at convenient points. These consist of ordinary knife-type "disconnects" suitably chosen for outdoor service at the maximum voltage of the constant-current circuit. Shorter circuits are divided into five parts by four switches, longer into seven or more sections. Switches are, where possible, mounted on poles where both sides of the circuit are available, since this aids in trouble location. A ground pipe is driven at the base of the switch pole and a ground wire is run up the pole to a point near the switch and terminated in a connector convenient for testing. Instructions to trouble men using sectionalizing switches are as follows:

Ground.—Have substation operators clear circuit terminals. Open sectionalizing switch and ring out each side to ground connection with a magneto. Grounded section rings. If there are two switches on test pole, open both, thus cutting circuit into three sections.

Open Circuit.—Have substation operator ground circuit terminals. Open sectionalizing switch and ring out each side to ground connection. Open section will not ring. If there are two switches on test pole, open both and ring terminals toward substation. If both ring, break is in loop beyond switches. Check this by attempting to ring across loop terminals.

Short.—Trace by observing dead lamps.

Cross.—Open sectionalizing switch or switches and test for hot section by grounding.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

RATES FOR THAWING

FROZEN WATER PIPES

Average Return per Service in Binghamton, N. Y.,
Is Approximately \$13—Eighty Jobs Are Under-
taken in One Cold Week

Owing to the extremely cold weather which has recently been experienced there have been a great many applications made to central stations and contractors for thawing out frozen water pipes. During the week of Jan. 5 to 12 there were eighty requests for this class of work in Binghamton, N. Y. The Binghamton Light, Heat & Power Company's methods of accomplishing these thaw-outs have been very successful, and the practice is a source of revenue. The minimum charge for the work is \$10 per service, to which is added \$1 for each mile that the customer is from the company's stockroom, \$1 for each 100 ft. (30.4 m.) that it is necessary to run service wires, and \$1 for 0.5 in. (1.27-cm.) increase in size of pipe over 1½ in. (3.81 cm.). The average return from thawing a pipe by the electrical method is approximately \$13.

HOW ONE CENTRAL STATION ENCOURAGES ECONOMY

Records of All Labor and Materials Are Kept on a
Series of Forms and the Success of Each
Foreman Is Checked

A scheme which encourages employees to economize time and material has been successfully developed by the Spokane (Wash.) Heat, Light & Power Company. The idea developed primarily in connection with construction work, but has been extended to include practically all operations where labor and materials are involved, even to firing boilers in the central heating plant.

The plan simply requires an advance estimate of the cost of any work to be done, and this estimate, embodied in a written work order, is given to the foreman or that employee who has the particular work in hand. Thus the work order becomes a bogie to the foreman and he endeavors to keep within it if he can. If he exceeds the figure set, he has to secure authorization for more expenditure, and his explanation of this situation brings out either (1) unforeseen conditions, which aid the estimating department in future work, or (2) evidence of waste which the foreman must clear up to the satisfaction of his superior.

The advantages claimed for the scheme are that, in addition to the actual money saving, the psychological effect is excellent. Foremen dislike to exceed estimates and be obliged to explain why, and on the other hand they take pride in keeping the cost below the estimate. There are also the advantages of an accurate record of costs conveniently arranged, an allocation of all charges

for labor, a constant check on materials on hand, and a means of making up the payroll easily at any time by totaling work-order records.

There are several forms about which the system centers. These begin with a letter size form known as the A. F. E. ("authority for expenditure"—Fig. 1), on which are entered the name of customer and a brief statement of the work to be done, with a list of the more important items that will be required on the work. It also states the amount which the work is estimated to cost. Before this A. F. E. sheet receives a work-order number and the work is classified it must be signed by officials of the sales department and the accounting de-

FIG. 1—FORM USED TO EMBODY "AUTHORITY FOR EXPENDITURE" IN CENTRAL STATION OPERATION

partments, as well as by the estimator and some one in a managerial position, either the general manager or the president. These A. F. E. sheets are made out in triplicate, one copy going to the superintendent, who usually prepares the estimates, one copy to the engineering department and one to the accounting department. By using different colors the three forms are readily kept separate.

Next in order comes the work order (Fig. 3), a square 4-in. (10.16-cm.) slip, also made in triplicate, or which the most important entry is simply the work-order number. Of course, it also carries date and résumé of the work to be done. The copy of the work-order sent to the superintendent is on white paper and is simply his notification. It is not preserved or required again in the records. The yellow and blue copies, however, going to the accounting department and the foreman respectively are carefully kept, and by them the progress of the work is checked on the ledger

sheet. This sheet (Fig. 4), which enters the scheme at this point, is a page from a loose-leaf file. It also bears the work-order number which identifies each individual job all through the records and carries the accounting department's detailed record of all materials and labor. It carries the figure which the work was estimated to cost, so that as the items of labor and material charges to the job increase their total can be compared with the estimate for the job. Thus the approach to the limit is readily seen and checked with the progress of the work.

As soon as the accounting department gets a yellow work-order slip, this is attached to a blank ledger sheet made out for the job, thus showing that it has been approved for construction. When the work is finished the blue work-order slip, duly signed by the foreman, is also attached. Thus a glance through the file shows what work is authorized and what is completed.

When a foreman requires materials he gets them from the warehouse by signing a small form called a warehouse slip (Fig. 5), on which the materials are itemized and which bears the work-order number. This

small time slip (Fig. 2) filled out for every workman every day by his foreman. It bears the signature of workman and foreman and indicates the number of hours each man put in, the work-order number to which his work is to be charged and the total charge on each work order. The accounting department enters these data on the ledger sheet bearing the corresponding work-order number. Thus the system simplifies to the point that practically all data of permanent value are carried by the ledger sheet and a convenient means of completely checking the estimate, cost or progress of any job is thus afforded.

What are known as standing work orders are assigned to such work as firing boilers and any other plant maintenance work, so that the daily reports can be simplified and yet keep the records standard for all kinds of work in which the company uses labor and material.

The system is a new feature, having been worked out in its present form only a few months ago, and minor changes have been made in it up to a recent date. However, company officials express great satisfaction in its

The image displays four forms used in a systematic accounting system for construction work.
1. **DAILY TIME SLIP (Fig. 2):** A form for recording daily work hours. It includes fields for 'Spokane Heat, Light and Power Co.', 'SPOKANE, WASH.', a date field (191...), and a section for 'WORKMAN NO.' with columns for 'RATE', 'HOURS', and 'AMOUNT'. It also has a 'FOREMAN' signature line.
2. **WORK ORDER (Fig. 3):** A form for authorizing work. It features the company name 'Spokane Heat, Light and Power Co.', a 'No.' field, and a 'FOREMAN' signature line.
3. **LEDGER SHEET (Fig. 4):** A large ledger with multiple columns for tracking costs. It includes sections for 'MATERIAL' and 'LABOR', each with sub-columns for 'DATE', 'W I', 'AMT.', 'No WKM N', 'No Hrs', and 'AMT.'. It also has a 'REMARKS' column.
4. **WAREHOUSE SLIP (Fig. 5):** A form for issuing materials. It includes the company name, a 'No.' field, a 'Dated' field, and a section for 'Issue and charge the following Supplies to W. O.' with columns for 'DESCRIPTION', '@', and 'AMOUNT'. It also has a 'FOREMAN' signature line.
The forms are shown overlapping, illustrating how they are used together in the accounting process.

FIGS. 2, 3, 4 AND 5—TIME SLIP, WORK ORDER, LEDGER SHEET AND WAREHOUSE SLIP USED BY PACIFIC COAST COMPANY TO SYSTEMATIZE OPERATION

is a notice of materials to be charged to a job and is sent to the accounting department and copied on the ledger sheet carrying the corresponding work-order number. Credit for materials returned from a job is later given on a similar slip and likewise listed on the ledger sheet.

One more form enters into the scheme. This is a

effectiveness and point to notable reduction in construction costs since its adoption.

The system described in the preceding paragraphs has been worked out by Ludwig Kemper, president of the Spokane Heat, Light & Power Company, in conjunction with H. W. John, who is secretary-treasurer of the company.

ELECTRIC VEHICLES MAKE RECORDS IN SNOW DRIFTS

Blizzards and Coalless Days in Chicago Fail to Tie Up Storage-Battery-Driven Passenger and Commercial Cars

Owners of electric vehicles in Chicago are enthusiastic over the "cold-weather" results that their cars have given this winter. Commercial car users have had considerable faith in the snow-fighting ability of their electric trucks, but such an opportunity as the recent

AN INSTANCE OF PARTICULARLY HEAVY GOING THROUGH BLIZZARD-STRIKEN STREETS

blizzards afforded for the supreme trial of the trucks has not been given the owners before. The trucks and passenger cars came out of the tests successfully, and as a result have gained more staunch supporters.

The firm of Case & Martin, a pie company, has operated sixty-three trucks through two severe blizzards in which the snow has drifted to depths of from 3 ft. to 10 ft. (0.9 m. to 3 m.) all over the city. In spite of these severe conditions the trucks have made from 32 miles to 52 miles (51 km. to 83 km.) a day. The regular trips to Evanston, Oak Park, West Pullman and other suburbs were made daily. Marshall Field & Company stated as their experience that the electric trucks on short hauls in the city would conquer drifts that gasoline cars would not dare attack. When snow did clog around the battery box and stop a car the drivers had only to clear the snow away from the box, put a small shovelful of ashes under the wheels and go ahead. When some of the company's big gasoline trucks stuck in drifts on the south side of the city an electric was sent out to pull them out, and succeeded in the job. The company has maintained two deliveries a day in spite of the weather, except on the two days when there was no street traffic. The cars averaged 30 miles (48.2 km.) a day in the snow.

HOW SNOW PLOWS WERE HAULED

The Commonwealth Edison Company used one of its trucks in an ingenious manner to pull a snow plow. No truck could pull a plow through the drifts with a direct hitch. In fact, it was a feat for a truck to get through itself. This particular vehicle was fitted with a winch for pulling cable. In its snow-plowing operations it would plunge through the drifts for a few hundred feet, its drivers would dig down to a manhole and anchor the truck. Then the snow plow attached to the end of a hauling line would be pulled up to the truck by the

cable-pulling winch. This operation was repeated over the full length of street to be cleaned.

In the passenger-car field equally satisfactory service was given. Harry Salvat, president of the Fashion Automobile Stations, reported that his men were skeptical about sending out customers' cars. Mr. Salvat was not skeptical. Taking his own car, without even equipping it with chains, he went out the first morning after the heavy snowfall and drove 52 miles (83.7 km.) through the drifts. Since that incident all of the Milburn cars operating out of the Fashion garages have been continuously in service. But, what is more important, every employee of the Fashion stations is now enthusiastic about electric cars. On coalless days the Fashion company's battery-exchange plan proved its worth, permitting customers to get charged batteries at any time without violating the Garfield order.

GOOD RECORD AT DETROIT

The Anderson Electric Car Company also reported that its customers found no difficulty in negotiating the deep snows anywhere in the Middle West. A. C. Downing, who went to the Chicago Automobile Show after a trip from Detroit through Louisville, Ky., Evansville and Indianapolis, Ind., stated that the performance of electric cars in the snow has surprised even the Detroit company's agents. At Detroit the company after the first severe snowfall telephoned customers telling them to go ahead and use their cars and to call the factory for aid if they got into trouble. As the result of this the company had only four "pull-ins" in Detroit, as against seventy-eight "pull-ins" which a certain eight-cylinder gasoline car with an equal number of cars out had to its credit. At Evansville, Ind., the company's dealer enlarged its list of prospective customers by going into the residential districts on mornings when other means of transportation failed and inviting pedestrians to ride downtown.

From the owners of electric cars the statement is

ELECTRIC TRUCK PULLING SNOW PLOW TO CLEAR STREET FOR OTHER VEHICLES

heard in all quarters that the cars will pull through almost any depth of snow. This takes a little more energy than usual, but that is true of any car. The usual speed will not be attained, but with the condition of the streets as it is after a blizzard the electric will go as fast as it is safe to drive.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Iron Commutators.—FREDERICK MURGATROYD.—The fact that war conditions in Germany have necessitated a limitation of the use of copper and enforced the manufacture of iron commutators in certain classes of machines raises the whole question of the commercial possibility of iron for this use after the war. Presuming that an iron commutator will always be cheaper than one made of copper, then, provided there are no insuperable commutation or mechanical difficulties in operation, it can be safely assumed that the iron commutator as a commercial proposition has come to stay. The author points out that while British engineers will naturally watch developments in Germany, it would be wise for manufacturers in England to tackle seriously the question of iron commutators on their own account. The problem appears to be one for the brush engineer to solve. Sparkless commutation would be attained with much greater difficulty in view of the increased reactance voltage and the extra attention required to maintain a good polished commutator surface. With regard to the difference in friction coefficients and contact drops as a result of the change from copper to iron, it may be noted that German experience seems to show that there is practically no difference in the temperature rise of iron and copper commutators working under identical conditions. Whether this should be taken as a fact, or whether German engineers are merely making a virtue of necessity, is certainly doubtful. That iron commutators would require careful watching in operation is obvious, and in certain situations, such as in hygroscopic atmosphere, the formation of rust may forbid the adoption of iron. Trouble may occur with recessed mica owing to an accumulation of rust or of an oil-and-rust paste in the slots of the segments, but this is a detail which should not present any great obstacle.—*London Electrical Review*, Jan. 18, 1918.

Parallel Performance of Static Transformers.—Remarks made upon an article on this subject in the *Revue Générale de l'Electricité* for Sept. 29, 1917. It is entirely possible, the writer holds, to manufacture transformers that will operate in parallel with existing equipment if attention be paid to the following points: (1) Strength of the apparatus; (2) polarity; (3) short-circuiting voltage; (4) ratio of transformation with no load; (5) ratio of transformation with load; (6) resistances of primary and secondary windings; (7) ohmic fall of voltage or output and losses when operating at no load.—*Revue Générale de l'Electricité*, Jan. 5, 1918.

Lamps and Lighting

Calculations in the Use of Projectors.—WALDO C. COLE.—In the protection of industrial plants as well as in ornamental illumination the question of how many projectors to use at a given distance is one of the utmost

importance. A combination of theoretical calculations under ideal conditions corrected by practical factors produces very accurate results, according to the problems considered by the author. The curve presented for the determination of light intensity at given distances should prove of great value in actual use.—*Journal of Electricity*, Jan. 15, 1918.

Problems of Factory Lighting.—ROMAINE W. MYERS.—The speeding up of production processes by means of more adequate shop lighting is always a live subject with electrical men, and to-day it has come to be one of the important war services. The article in question is on the elements of successful illumination as applied to the shops of the Judson Manufacturing Company of Oakland, Cal. The author points out that the proper maintenance of a good lighting system after installation should be carefully considered. The deterioration of tungsten lamps and reflectors due to accumulations of dust on the lamp and reflector surfaces amount to as much as 40 per cent if not properly cleaned. In one installation it was found under test that 25 per cent of illumination was lost by the accumulation of dust on the lamp alone.—*Journal of Electricity*, Jan. 15, 1918.

Generation, Transmission and Distribution

Emergency Substitutes for Coal.—J. F. SPRINGER.—The author points out that when a shortage of coal occurs the factory that is equipped to utilize a substitute is not likely to suffer much delay, for the other kinds of fuel are certain to be available. He tells the characteristics of these substitutes for steam coal: Fuel oil, tar, natural gas, producer gas, charcoal, coke from refuse coal, powdered coal from refuse, and refuse coal.—*American Industries*, January, 1918.

Design of High-Voltage Insulators.—C. E. OAKES.—(Third installment.) The author takes up the effect of the application of high frequency to porcelain insulators. A summary of insulator requirements follows: (1) Sound vitrification, resulting in high-puncture strength and low porosity, obtained by better manufacturing methods. (2) The highest surface resistance that is compatible with other requirements. A high surface resistance should not be obtained at the expense of short air spaces between petticoats or flanges. A uniform distribution of electrostatic stress is as important as high-surface resistance. (3) A uniform distribution of stress obtained by a symmetrical arrangement of metallic surfaces. (4) Provision of large air spaces at the junction of petticoats in the pin types. (5) As far as possible the air and porcelain, being dielectrics of different constants, should not be placed in series. (6) Provision of the maximum thickness possible together with the requirements in (3). The voltage at which corona first appears can be raised appreciably by judicious designs in this direction. (7) The radius of curvature of the head of the porcelain cap

in the cap and pin type insulator should be as large as possible.—*Sibley Journal of Engineering*, January, 1918.

Traction

Electric Tractors in Municipal Service.—A description of various types of tractors adopted for municipal service by the city of Wiesbaden, Germany, on account of the scarcity of horses. The machines still need perfecting, especially as regards the extinction of the arcs. For light vehicles with small batteries forty elements (80 volts) are enough. Two motors rated at 5 hp. are satisfactory for most vehicles, four motors being desirable for the heaviest ones. These motors should withstand an overload of 50 per cent for long periods. Motors of high speed and double reduction are recommended.—*Revue Générale de l'Electricité*, Jan. 5, 1918 (abstracted from *Zeits. V. D. I.*, April 28, 1917).

Installations, Systems and Appliances

Calculation of Energy Absorbed by Starting Rheostats.—J. SAINT-GERMAIN.—In this article a graphical method is described by which, in every case, one may calculate the energy absorbed in rheostats used to start direct-current and induction motors in terms of acceleration and resistance and of the duration of the starting period. Algebraic formulas are given which permit the same result to be obtained more rapidly.—*Revue Générale de l'Electricité*, Jan. 5, 1918.

Electrical Mining Machines.—F. ROBIN.—An extended technical article on electricity as employed in the extraction of coal and iron. The author seeks to reduce to the minimum the I^2R losses in the armature of the motor and the generator used for this service by properly proportioning the periods of acceleration of operation and of slowing down.—*Revue Générale de l'Electricité*, Jan. 5, 1918.

Electric Cargo Winches.—E. F. WHITNEY.—The use of electricity on shipboard is increasing rapidly in both the variety and the extent of its applications. Most ships to-day are electrically lighted, have their fans, pumps, etc., electrically driven, and are equipped with a radio outfit. In addition to these applications, the galleys of many ships are electrically equipped, and a considerable number of ships are electrically propelled. A comparatively recent but equally successful development is the application of electric drive to cargo winches. The magnitude and characteristics of winch work are defined, the electrical equipment is described, and the superiority of its operation over steam-winch operation is discussed in terms of reliability, speed control, cost and efficiency.—*General Electric Review*, February, 1918.

Wires, Wiring and Conduits

Cable Fault Localization in Practice.—D. M. W. HUTCHISON.—The writer gives some actual results from his own experience in the locating of faults in underground cables. Loop tests, with the dial resistance boxes supplied in so-called "mains testing sets," and "search-coil tests," were found to be very inaccurate and were abandoned. The writer points out that for the difference of potential tests a 4-volt storage battery, a bank of lamps, a reversing switch, an arc-lamp resistance, and a galvanometer like that used in loop tests were all the apparatus required. On the occurrence of a fault the procedure was as follows: All service fuses were removed, both ends cleared, and a megger test and

lamp tests were made. The faults were then classified as follows: (1) All cores shorted and earthed; (2) all cores shorted but not earthed; (3) two cores shorted, third good, no earth; (4) two cores shorted and earthed, third good; (5) one core earthed, others good, and (6) total disconnection. The author explains in four examples the calculations necessary. Example 1 is a loop test, class 3 fault, three-core V.B. cable-megger tests. Example 2 is a loop test, class 3 fault. This has been given because it is a good example of how the megger tests may be misleading if not supplemented by lamp tests. Example 3 is a difference of potential test, method 1, class 4 fault. Example 4 is a difference of potential test, method 2. This is an example of the method which was used for faults of classes 1 and 2.—*London Electrical Review*, Jan. 18, 1918.

Electrophysics and Magnetism

Graphical Representation of Resistances and Reactances in Multiple.—H. C. STANLEY.—Frequently a number of resistances or reactances are connected in multiple and it is desired to know their total or combined value of resistance or reactance. The calculation necessary to obtain this combined value is usually simple in principle but at times laborious in practice. For approximate results and as a check on the more accurate calculations a graphical solution is given in this article for some representative cases.—*General Electric Review*, February, 1918.

Units, Measurements and Instruments

Electromagnetic-Clutch Indicating Device.—V. KARAPETOFF.—This is a device for predicting the performance of the Entz electromagnetic clutch and transmission used on motor cars propelled by internal-combustion engines. This device is one of the several kinematic models, partly built and partly designed by the author, for the general purpose of quantitatively imitating the performance of various types of direct-current and alternating-current machinery. He hopes to bring them to a degree of convenience and perfection such as to do away with tedious analytical computations, or complicated graphical diagrams used in the design and predetermination of performance of electrical machinery. It is pointed out that the designer will simply have to select provisionally the constants of his proposed machine and to set certain types of a kinematic device to correspond to these constants. Then by moving certain levers he can obtain and read to scale various performance characteristics of the proposed machine, such as speed, power factor, output, etc. If the performance is not satisfactory, he can easily change the setting of constants and after a few trials get the desired characteristics.—*Sibley Journal of Engineering*, January, 1918.

Telegraphy, Telephony and Signals

Electrical Signaling and Control on Railways.—C. M. JACOBS.—A comparison of British and American signaling with details of control.—*London Electrical Review*, Jan. 18, 1918.

Reis Telephone and Nature of Sound.—ARTHUR BESSEY SMITH.—This is a discussion of the "break-and-make" theory of the Reis telephone in regard to its relation to nature of sound. The structure of the Reis telephone, its intended action and its occasional action are discussed. It is pointed out that this is not a practical instrument.—*Telephony*, Jan. 26, 1918.

Scientific and Industrial Research

A Department Devoted to Interchange of Ideas, Investigations Contemplated, Research Facilities Available, and Suggestions for Co-operative Work.

Conducted by PROF. VLADIMIR KARAPETOFF

Cornell University, Ithaca, N. Y.

FEATURES OF BRITISH PRACTICE IN RESEARCH

Taken from Report of British Committee for Scientific and Industrial Research as Suggestions for Formulating American Practice

Some points are brought out in the report of the British Privy Council committee for scientific and industrial research which might be utilized in organizing research in this country. The report covers features of organization, administration and policies of the committee.

Funds Available.—The Imperial Trust for the Encouragement of Scientific and Industrial Research holds £1,000,000 that Parliament has voted for research purposes. Manufacturers' associations, the London County Council and some governmental departments have also contributed funds for specific purposes.

Personal Grants to Research Workers.—Thirty-six awards in the nature of maintenance grants were made to individuals, of which twenty-four went to students being trained in the methods of research, ten to independent research workers and two to research assistants. Grants will also be made for apparatus and materials.

Industrial Versus Pure Science Research.—During the past year the committee has devoted its chief effort to the organization of industrial research rather than to the prosecution of work in pure science; first, because it felt the paramount importance of arousing the interest of manufacturers and, second, because of the influence of the war. It emphasizes the hope that the absence of references to pure science should not be taken as indicating a lack of appreciation of its importance.

Trade Research Associations.—Many trade associations have lately come into existence, some of which include research among their objects. The committee has helped in their organization and has assisted and co-operated in their research activities.

Research in the Universities.—Hearty co-operation of the principal universities, technical schools and trade schools in England has been secured, and their resources have been co-ordinated for the important problems on hand. A closer connection is being established between these institutions and the industries which rely upon results of research in the manufacture of their products.

Technical Societies.—The committee is co-operating with the electrical, mechanical and mining engineers' institutions and other professional societies, in some cases subsidizing the researches originated by the institutions and extending their scope.

Information Collected and Published.—In co-operation with technical societies and institutions of learning

the committee has collected and published available information and is continuing this useful work, which will greatly simplify that of future investigators. It is also preparing memoranda on various fields for research, with an analysis of the problems involved and the proposed program for research.

Assistance to Individual Manufacturers.—An arrangement has been made with the Royal Society by which it will assist the committee in selecting the institution or research workers best fitted for a particular investigation. If the investigation progresses satisfactorily, the manufacturer is invited to contribute part or all of the expense in exchange for the exclusive use of the results over a given period. Another proposed way is to attach an investigator to the works laboratory and share expense with the manufacturer.

Summary of Investigations, Available Apparatus and Research Suggestions

INVESTIGATIONS UNDER WAY OR COMPLETED (RESEARCH WORK REPORTED SINCE JAN. 19)*

GASES, COMBUSTIBLE, IN THE AIR.

Development of an electrical method of measuring the amount of combustible gases in the air.—*E. R. Weaver and E. Weible, Bureau of Standards, Washington.*

HEAT TRANSMISSION.

Rate of heat transmission from the surfaces of hot bodies to fluids passing over them. The primary object is a reduction in the weight of gasoline engines for aircraft by a more efficient design of the cooling surfaces, but the data obtained will also have other important industrial applications.—*National Physical Laboratory, England.*

RESONANCE IN ALTERNATING-CURRENT CIRCUIT.

A suitable combination of series and parallel circuits makes it possible to secure two maximum values of the current, while the voltage is kept constant and the frequency is being varied. A considerable control can be exerted on the nature of the variation of the total impedance and power factor with change of frequency. If the total impedance is plotted as a vector in a polar diagram, the hodograph can be made to assume the form of a strophoid with the loop embracing the current axis. In such a case the current hodograph has the form of a limaçon and the power factor passes through unity at three different frequencies and can be made to hover near unity over a large range. The considerations involved are of interest in connection with non-harmonic currents in complex circuits.—*H. K. Dodge, University of Iowa.*

SYNCHRONOUS MACHINES, SHORT CIRCUIT.

(1) Flux distribution in alternators with salient and non-salient poles, under sustained short-circuit conditions. (2) Calculation of phenomena accompanying sudden short circuits in such alternators. (3) Experimental and theoretical study of electro-mechanical phenomena occurring under sudden short-circuit conditions.—*N. S. Diamant, Rice Institute.*

APPARATUS AVAILABLE FOR RESEARCH

SALT LAKE CITY, UTAH.

An artificial transmission line is available which on a small scale duplicates in considerable detail the actual transmission system of the old Telluride Power Company. The artificial line consists of inductance coils, plate condensers and wires of high resistivity, which represent to a certain scale the inductance (self and mutual), the capacity and the resistance of the actual line. The transformers, the load and the generators are also imitated, so that the performance of the actual line may be studied under many normal or abnormal conditions. An oscillograph and other measuring instruments are available. Some tests have been made on this artificial line to elucidate the action of reverse-power relays under various short-circuit conditions. (See A. I. E. E. *Proceedings*, Vol. 36 (1917), p. 713, where a detailed description of the line will also be found.)—*M. Cheever, Chief Engineer Utah Power & Light Company.*

SUGGESTIONS FOR RESEARCH

INSULATION, THERMAL CONDUCTIVITY.

Investigation of the thermal coefficient of the insulating medium in which copper coils are embedded in electrical machinery.—*B. A. Behrend, Boston, Mass.*

PHASE BALANCING.

Investigation, theoretically and experimentally, of the extent of balancing possible with polyphase induction motor connected across polyphase circuit and also the motor constants that are conducive to most accurate balancing. Would a synchronous motor accomplish the same purpose with the additional advantage of phase correction?—*Editorial suggestion.*

VENTILATION OF ELECTRICAL MACHINERY.

The flow of air and its convective capacity at different velocities and at different temperatures; the effect of eddy currents and vortex motion in such air currents on their convective capacity; obstacles to the motion of air and the creation of eddies at edges due to discontinuous motion.—*B. A. Behrend, Boston.*

*The names of individuals given after each institution reporting investigations are those of persons with whom others interested should communicate. All institutions reporting research work should give such names.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

INTERCONNECTION SAVES POWER AT SCHENECTADY

Co-operation of Five Utility Companies and One
Manufacturing Company Relieves Critical Power
Situation on Short Notice

Under normal conditions the Schenectady Illuminating Company and the Schenectady Railway Company receive all of their power from the General Electric Company, which generates part by steam and receives part from the Schenectady Power Company. The latter company has a hydraulic station at Schaghticoke. Owing to the abnormal winter the water supply at the Schaghticoke plant is practically frozen up. After carrying for some weeks this burden on the steam plant of the General Electric Company, combined with the enormous load brought on by the large amount of government work which has been done in Schenectady, it became imperative at once to relieve the steam plant of the General Electric Company of from 2000 kw. to 4000 kw. during the day.

In the emergency General Manager Henry W. Peck of the Schenectady Illuminating Company immediately got in touch with Carl H. Graf, Municipal Gas Company of Albany; W. A. Buttrick, Adirondack Electric Power Corporation; E. B. Doen, Schenectady Power Company, and A. L. Rohrer, General Electric Company. Within twenty-eight hours of the time that Mr. Peck was notified of the urgent need he was receiving, with the most hearty co-operation of the officials mentioned, the necessary supply in Schenectady.

This supply was transmitted to Schenectady indirectly. The Adirondack Electric Power Corporation, with hydraulic plants at Spier Falls and Mechanicville, normally supplies electric energy to Albany, as well as to Troy, Glens Falls and other places. The shortage of water had already required the supplementary operation of the 15,000-kw. steam-turbine plant of the Municipal Gas Company. Upon receipt of the request from Schenectady this station assumed more of the Albany load to the approximate amount required by Schenectady, thus relieving the Adirondack company of that load.

The Adirondack company, in turn, having an open-air switching connection with the high-tension line of the Schenectady Power Company near Mechanicville, made connections and supplied the needed power from its line over one of the lines of the Schenectady Power Company to a section of the busbars in the power house of the General Electric Company, whence it was conveyed on the lines of the Schenectady Illuminating Company and Schenectady Railway Company to their substation.

This co-operation of five utility companies and one manufacturing company is noteworthy, and undoubtedly its successful accomplishment is an indication of the advantages that accrue through a consolidated power system.

SIDELIGHTS ON THE EVENTS AT WASHINGTON

Criticism from Congress, Which Demands Action
and Does Not Act Itself—The Bills
Which Are Not Passed

(By Our Washington Correspondent)

This is the day of criticism. It has been inspired in Congress—to what extent at the behest of the people back home remains to be seen. On every side one hears that Congress is demanding action, reorganization and co-ordination. What is Congress doing to keep the war machine moving, besides blowing the hot breath of criticism? In two precious months, while American lifeblood is taken in the trenches and on the high seas, while business is straining behind the lines, Congress has not placed on the legislative books one single big constructive act.

* * *

Money is needed. Authorization is needed to spend money, to plan, prepare, act, co-ordinate. As this is written the House of Representatives has passed but three of the big money-supply bills—post office, Indian and agricultural—and those, in the large sense, are not war money bills. By the time this is printed the legislative, executive and judicial appropriation bills may be passed by the House. The Senate has not passed any of the appropriation bills. The only measures of consequence passed by the Senate so far are the coal and oil lands leasing bill and the Shields water-power bill. These have not been passed by the House. In other words, literally nothing has been done. Industries need the apparently unobtainable passage of the conference report on the Webb bill, which would permit combination for export trade, as well as a real law permitting water-power development.

* * *

Secretary Baker is to go to France for an indefinite period, to take his seat on the Supreme War Council. In his place the President must find another man who, under the President's proposed legislation, will fill the post which Senators have been trying to create—Ministry of Munitions, or its equivalent. Is not this the place for Mr. Stettinius, and is it not time to bring forward business men of his type?

* * *

There has been too much let-up in many fields already. Highways must be maintained and developed as a war measure. With the failure of steam transportation, truck lines are coming more into use. There must be money for more power plants. It is not at all certain that the power-from-coal question will be solved by good weather and restoration of steam-traffic facilities. More power plants, or expansion of present power plants, is indicated. Capital must be obtained and a properly founded and administered "War Finance Corporation" could be of the greatest service.

CURTAILMENT OF LIGHTING
MEANS SMALL COAL SAVING

Preston S. Millar, in Paper Before Illuminating Engineering Society, Says Other Methods Will Save More Fuel

In a paper on "Lighting Curtailment," presented before a special meeting of the Illuminating Engineering Society, New York, on Feb. 14 and at a meeting of the Philadelphia Section on Feb. 15, Preston S. Millar, gen-

eral manager Electrical Testing Laboratories, New York, said that the amount of coal used in the production of electric light is less than 2 per cent of the total coal output of the country. Curtailment, therefore, can accomplish relatively little in saving coal.

Mr. Millar made prominent in the discussion his belief that in general the standards of illumination intensity before the war were too low. In view of the war and fuel shortage, he believes that lighting ought to be reduced in some classes of service and increased in others. Any practicable curtailment is about 7 per cent net for all classes of lighting service, or a trifle more than one-tenth of 1 per cent. Declaring that it is practicable to effect much larger fuel savings by other methods with less disadvantage to the public, Mr. Millar called attention to a number of points, including the elimination of small power plants, with their "inherently lower efficiency," estimated to be "responsible for the use of one-third more coal than necessary."

RECOMMENDED ADJUSTMENT OF ILLUMINATION INTENSITIES IN VIEW OF THE WAR AND THE FUEL SHORTAGE

Class of Lighting Service	Per Cent Distribution	Desirable Adjustments in Intensity, Per Cent	
		Per Cent	Per Cent
Street	15	—	5
Public building	3	—	10
Industrial	18	+	50
Protective	1	+	200
Commercial	20	—	20
Residence	26	—	20
Recreational	7	—	40
Advertising	5	—	80
Miscellaneous	5	—	10
Total	100	Net	7

shortage, the equivalent of which must be saved, is 50,000,000 tons; the estimated saving in coal during 1914 if all private plant power could have been replaced by central station power, 13,000,000 tons, and the estimated saving in coal by maintaining temperature of building interiors at 67 deg. Fahr. instead of 70 deg. Fahr. comes to 10,000,000 tons.

It is evident therefore that the total consumption of coal in the production of all electric light is relatively

not a very large item in the coal consumption of the country. If the entire electric lighting of the country were cut off, the saving in coal would be only 24 per cent of the required saving and no more than would be accomplished by a reduction of readily practicable extent in the heating of buildings.

The author has prepared the table in this column, which roughly estimates how artificial light is dis-

Cost of artificial illumination, one-half of 1 to 2 per cent of the total expenditure of the people, compares with other expenditures as follows: Illumination, \$500,000,000; liquors, \$665,000,000; tobacco, \$490,000,000.

The significant figures to have in mind when discussing this subject, said Mr. Millar, are as follows, all being rough approximations: Total coal output of the country, 640,000,000 tons; total employed in production of electric light and power (traction excluded), 36,000,-

000 tons; total employed for production of light by electricity, 12,000,000 tons.

According to these estimates, about 2 per cent of the coal consumption of the country goes into electric light. Some comparisons may assist to provide a proper perspective for the consideration of these data: The coal

tributed among the several classes of service adopted as a classification for this purpose.

Beside these figures showing approximate distribution of lighting among the several classes of service are figures representing the consensus of opinion of ten qualified observers as to the extent to which lighting in each class of service ought to be curtailed or increased in the present emergency. The values are thought to be reasonably indicative of expert opinion on this subject at the present time.

One may ask, says Mr. Millar, why this net saving should be adopted as the conclusion from this survey instead of 17½ per cent, which is the gross saving from which no deduction is made to cover the desirable increases. The author says that he would consider himself unworthy to discuss this important subject before the Illuminating Engineering Society if he failed to insist that except in the presence of an actual coal shortage which could not be compensated by saving elsewhere, the increases in intensities which are recommended for certain classes of service are more important to the public welfare than is the coal saving which it is desirable to effect in other classes of lighting service. The net saving therefore is the value which should enter into our calculations.

In his conclusions Mr. Millar says:

After careful consideration of this subject, including study of the statistics presented in this paper, the author has reached the personal conclusion that to curtail lighting generally would result in damaging the eyesight and impairing the efficiency of our people. He believes that the country cannot afford to incur such a risk for the sake of the small coal saving which may result—a saving which may be accomplished otherwise with much less disadvantage.

UTILITIES MUST CONSERVE THEIR FINANCIAL STRENGTH

**California Railroad Commission, in Case Affecting
Pacific Gas & Electric Company, Favors
Expenditures to Win the War**

The California Railroad Commission, in a decision permitting the Pacific Gas & Electric Company to use \$771,348, proceeds of the sale of bonds for capital expenditures in the recent past, passes for the first time on the vital question of public utility financing in the war emergency.

A proposed issue of \$3,000,000 bonds is considered unwise now on account of the money market, and the company has so stated. The commission says:

It is a matter of common knowledge that many public utilities as well as other enterprises will have considerable difficulty in financing new construction during the war. The general welfare requires that our electric utilities, which play so vital a part in the nation's efficiency, shall in so far as possible conserve their financial strength so that they may continue to be able to secure such funds as are imperatively needed to increase their production and maintain their efficiency.

Expenditures which otherwise might be considered desirable, even though not immediately necessary, should be deferred in favor of expenditures most urgently necessary at the moment to increase the efficiency of these utilities to help win the war. Furthermore, while the cost of materials and money is abnormally high, it is in the interest of both the utility and its patrons that all work not clearly now necessary be deferred. This situation requires an analysis of proposed large expenditures from a different point of view from what was the case before the war.

PROBLEMS OF UTILITIES PRESENTED AT WASHINGTON

**Prominent Executives of Companies Appear Before
Capital Issues Advisory Committee of Federal
Reserve Board and Senate Committee**

Representatives of the public utility companies have had two opportunities in Washington within the last few days to present their problems to government legislators and officials and are much encouraged with the reception of their views.

On Feb. 8 these problems were presented before the capital issues advisory committee of the Federal Reserve Board, with Governor Delano and Governor Hamlin present and Allen B. Forbes, chairman, presiding. On Feb. 12 representatives of the utility companies appeared before the Senate committee on finance to discuss the proposed "War Finance Corporation" bill.

The argument before the capital issues advisory committee was presented by P. H. Gadsden, member of the war board of the American Electric Railway Association, at the request of John Stanley, president of the association. Mr. Forbes, chairman of the advisory committee, had requested heads of large utility organizations to be present, and in addition to Mr. Gadsden among those present were the following:

John W. Lieb, New York Edison Company, president National Electric Light Association; Alfred Forestall, president American Gas Institute; E. K. Hall, Electric Bond & Share Company, New York; H. H. Crowell, Commonwealth Power, Railway & Light Company, New York; C. M. Clark of E. W. Clark & Company, Philadelphia, and H. G. Bradlee, Stone & Webster, Boston.

At the hearing before the Senate finance committee statements were made by S. R. Bertron of Bertron, Griscom & Company, New York; Mr. Crowell and Mr. Gadsden. The argument, which was substantially the same at both hearings, was in effect as follows:

First—Public utility rates must be increased. Labor and materials are eating up equities in those properties. The fundamental remedy is to restore values by increase in rates.

Second—During the war the companies should be relieved of franchise requirements, such as paving streets and putting wires underground, regarded as unnecessary capital investment at this time.

Third—Companies are being called upon to make large expenditures for extensions and betterments to meet the war program. It is estimated that these expenditures for the year will be between \$100,000,000 and \$200,000,000 required for government purposes. Some way must be provided for the government to furnish this money.

Fourth—The public utilities—railway, gas and electric companies—have maturing obligations in 1918 of about \$225,000,000. Under present conditions, where the government has monopolized the whole money market, it is impossible to finance these maturities through the banks, and if the companies are to continue to perform their essential part in furnishing facilities for speeding up industry in this country the government must furnish utilities some relief in taking care of the maturing obligations.

It is understood that the Senate committee on finance was evidently impressed seriously by the situation which confronts the companies. On the question of rates members of the committee frankly asked the gentlemen before them if it is not possible for Congress to grant some relief. It is felt that the committee practically unanimously saw the force of the rate question, as well as sympathized with the suggestion

that the companies be relieved from non-essential expenditures; also there was apparently no question that the committee realizes that much new capital will be required by the companies in order to meet government war needs.

The committee by its questions indicated an apparent unwillingness to grant such unlimited powers as those conferred in Section D of the proposed "War Finance Corporation" bill.

Mr. Gadsden took the position before the committee that public utility securities are a class which must be taken care of and suggested to the committee that the words "public utilities" be inserted in this section of the bill to leave no doubt that it was the intention to provide for them.

A hearing at which representatives of public utilities will be present will be held soon on this bill before the House committee on ways and means.

RELATION OF THE WAR

TO JOBBERS' BUSINESS

Atlantic Division of Electrical Supply Jobbers' Association, Meeting at Philadelphia, Discusses Timely Problems—E. C. Graham Chairman

War in its economic relation to business was the keynote of the Philadelphia meeting of the Atlantic division of the Electrical Supply Jobbers' Association held on Wednesday of the present week at the Bellevue-Stratford Hotel.

The session opened in the morning with the presentation by M. A. Curran, general credit manager Western Electric Company, of a plan for the practical application of trade acceptances in a comprehensive manner. Mr. Curran emphasized the fact that there must be an intelligent introduction of trade acceptances if they are to prove to be of value in the long run.

Touching briefly on the opportunities for profitably increasing the business of electrical jobbers, J. M. Wakeman, general manager Society for Electrical Development dwelt largely on the growing strength of the electrical appliance market. He expressed the thought that wider distribution of electric ranges would leave its impression on the nation's domestic coal supply through more economical and efficient utilization of fuel.

Considerable enthusiasm arose over the paper entitled "What the War Means to American Business," read by G. E. MacIlwain, specialist of the Babson statistical organization. Mr. MacIlwain pointed to the industrial leveling of Europe and what it means to American business. Through the industrial-awakening of Europe the United States will face after the war a more efficient competition. The author showed a four-period condition: First, good business during the war, limited by priorities and curtailment of great private profits; second, a temporary lull to accompany real peace proceedings; third, a short, sharp peace boom at the immediate end of the war, and, fourth, a very marked decline and depression to follow. In closing, the speaker drew attention to the changing relation of labor to capital, predicting that the solution of the labor problem will come about through participation with capital in profits.

C. E. Patterson, comptroller, and J. F. Zoller, tax

attorney for the General Electric Company, went somewhat into detail on the accounting and legal aspects generally of the preparation of returns under the war tax law. The members of the division were urged to secure copies of regulation No. 41 relative to the war excess profits tax issued by the Treasury Department and corporation tax form No. 1031. Excess profits tax form No. 1103 is not yet ready for distribution.

At the close of the session officers for the ensuing year were elected. E. C. Graham, Washington, was elected chairman.

WORKLESS MONDAY ORDER

SUSPENDED BY GARFIELD

State Fuel Administrators, However, Still Have Authority to Enforce Restrictions and Reservations—Embargoes Hold

Dr. Garfield announced on Feb. 13 that the order for heatless and workless Mondays until March 25 had been suspended. However, state fuel administrators will retain the full authority heretofore conferred upon them to establish and enforce such restrictions and regulations as may be made necessary by coal conditions in their respective communities.

The Fuel Administrator said: "Conditions to-day warrant the conclusion that with the continued enforcement of the preferential delivery of coal under Section 1 of the order of Jan. 17, and continued transportation improvement, further restrictions on the consumption of fuel will not be necessary."

Director General of Railroads McAdoo concurred in the suspension of the order, but warned that it should not be assumed that there is no further need for economy in coal.

MOBILIZATION PLAN FOR THE

EDUCATIONAL INSTITUTIONS

Committee on Education and Special Training Is Created in the War Department with Advisory Civilian Committee

With a view to mobilizing educational institutions and their facilities for special training there has been created in the War Department a committee on education and special training. Associated with this committee will be five civilian educators, known as an advisory board of educators.

The committee will be composed of Col. Hugh S. Johnson, deputy provost marshal general; Lieut. Col. Robert I. Rees of the General Staff, and Major Greenville Clark of the Adjutant General's department.

The five advisory members of the committee, whose selection has been approved by Secretary of War Baker, are: Dr. Charles R. Mann of the Carnegie Foundation for the Advancement of Teaching and the Massachusetts Institute of Technology; Dr. James R. Angell of Chicago, dean of the faculties of the University of Chicago; J. W. Dietz of Chicago, director of education Western Electric Company, president National Association of Corporation Schools; James P. Munroe of Boston, member of the Federal Board for Vocational Education (which appointment will include the interests of the trade schools and schools of secondary grade), and Dr. Samuel P. Capen of Washington, specialist in higher education.

PORTABLE ELECTRIC TOOL MANUFACTURERS ORGANIZE

**Majority of Firms in Field Are Charter Members—
Standardization Planned—Walter Friedlander
of Cincinnati Elected President**

Manufacturers of portable electric tools organized the "Portable Electric Tool Association" at Indianapolis on Jan. 11 and 12. Already the new organization has fourteen members, leaving as prospective members only about six more important firms, most of which have expressed interest and will probably become members before the next meeting.

The constitution and by-laws of the association follow closely those of the Electric Power Club. There is no conflict between aims and purposes of the new association and the Electric Power Club, it is said, as the Portable Electric Tool Association will confine itself to tool problems. Briefly stated, the aims and purposes of the association are: First, discussion of subjects of interest and value to members; second, advancement and improvement of the portable-tool industry; third, collection and dissemination of statistics, and, fourth, standardization of design, manufacture and application of portable electric tools.

In the past this branch of the tool business has suffered greatly from those ills likely to be found in any young and actively competitive industry. When business was not flourishing, some manufacturers would get out a freak portable electric tool and by clever salesmanship would probably sell a few hundred. Frequent repetition of this process by many manufacturers has created a condition wherein there are many times the number of styles and sizes of portable electric tools needed to do any kind of work. Government departments sometimes contributed to this condition by requiring special tools built on bureau specifications, when a standard tool would have done as well.

The association, it is expected, will correct this, its standardization committee working with the government to establish proper and adequate standards. Portable electric drills, which will probably come first in the standardization program, will, it is likely, be reduced to ten standard sizes between 3/16 in. and 2 in. (0.47 cm. and 5.08 cm.). The motors required by the machines will, of course, be of sizes less than 2 hp. or possibly 3 hp.

Other evils which the association may attempt to correct later are the much-overworked free trial and free-repair "bugaboos." The goods of each association member are guaranteed, so it is argued that ten days' free trial with frequent extensions should not be necessary. Likewise it is believed that a just method can be found for dealing with the unfair customer who purchases a few tools from each manufacturer, then systematically reviles each set of tools to its manufacturer for the sole purpose of securing concessions in the way of free-repair parts.

The officers of the Portable Electric Tool Association are: President, Walter Friedlander, Hisey-Wolf Machine Company, Cincinnati; vice-president, F. Schneider, Van Dorn Electric Tool Company, Cleveland; treasurer, James Clark, Jr., James Clark, Jr., Electric Company, Louisville; secretary, R. S. Cooper, Independent Pneumatic Tool Company, 1307 South Michigan Avenue, Chicago.

LOCAL COMMITTEES ON CAPITAL ISSUES

**Committee of the Federal Reserve Board Announces
Formation of Local Bodies to Assist in
Passing on Applications**

The capital issues committee of the Federal Reserve Board announces the formation of twelve local committees organized for the purpose of assisting the central committee in passing upon applications originating in their respective districts.

In each Federal Reserve district there will be a sub-committee on capital issues, with headquarters at the Federal Reserve bank of the district. The sub-committee will consist of the Federal Reserve agent as chairman, the governor of the Federal Reserve bank as vice-chairman, and three other members chosen because of special qualifications for the work.

Bankers and others having broad experience in the financing of municipal, manufacturing or public utilities securities have been invited to become affiliated with the sub-committee as an auxiliary body, one or more members of which from time to time, as their advice and experience may be useful or helpful, will be asked to join with the sub-committee in investigating and passing upon specific applications. No committee member will give advice or report upon any application in which he has a direct or indirect personal interest. Members of these committees have undertaken this duty as a patriotic service to the country.

All applications for the approval of security issues are expected to be made direct to the capital issues committee, Federal Reserve Board, Washington, which will refer them to the particular district concerned.

Among the members of the local permanent or the auxiliary committees are a number familiar with utility problems.

NEW YORK CITY JOBBERS ELECT OFFICERS FOR YEAR

**New Constitution and Bylaws Also Adopted by the
Electric Club—J. E. McClernon the
President**

At the second annual meeting of the New York Electric Club, held on Feb. 6, officers were elected and plans discussed for the coming year's work. The membership comprises practically all electric jobbers of New York City. A new constitution and bylaws were adopted. The purpose of the club is stated as follows:

The object of the club shall be the advancement of the social, professional and commercial interests of the members, the elevation of the standard of electrical work, a furtherance of the use of electricity and the general development of the electrical industry.

A paid secretary-treasurer, W. J. Krieger, Marbridge Building, New York, has been employed to centralize and promote the work. Officers for 1918 were elected as follows: President, J. E. McClernon, Northwestern Electrical Supply Company; vice-president, Charles E. Benz, Holloway & Benz Company; executive committee: J. J. Hartt, Hartt & Morrison; G. P. La Shelle, W. R. Ostrander Company; J. H. Hughes, Alpha Electric Company; J. H. Owen, E. B. Latham Company; M. Zucker, A. Shemel & Company, and L. D. Bailey, Bailey Electric Supply Company.

INCREASING ECONOMY OF POWER IN CALIFORNIA

**Southern Group of Systems Now Under One Power
Dispatcher—All Feasible Tie-ins Are Con-
sidered—Water Shortage Will Be Serious**

At a hearing before the California Railroad Commission on Jan. 31 there was further detailed discussion of the interconnection of transmission lines and conservation of fuel oil. A detailed statement was presented by companies in the northern and southern divisions into which the State has been divided. The report of an earlier hearing appeared in the ELECTRICAL WORLD for Jan. 26, page 218.

A supplement to the report of the northern division, presented by John A. Britton, Pacific Gas & Electric Company, pointed out that northern California hydroelectric power companies are facing one of the most alarming situations in their history. "Not only are we faced with the necessity of generating about 30,000 additional horsepower to take care of the normal increase in amount of power needed each year," said the report, "but the lack of rain and snow may make it impossible to maintain the present output." Priority orders on a 15,000-kw. steam turbine unit now being built for the Pacific Gas & Electric Company have been secured. It is understood that this action has not only been approved by the Fuel Administration, but sufficient fuel oil to operate the unit has been guaranteed.

The report of the northern division, presented by J. E. Woodbridge, stated in detail where power could be exchanged to advantage from system to system, what new projects could probably be developed at once, and where additional interconnections were needed. The several methods of effecting greater economy which the committee recommended are expected to afford a combined saving on all systems in the northern division of 1,758,000 bbl. of oil per year.

The most important interconnection recommended is that which would tie in the Northern California Power Company system with the Pacific Gas & Electric lines at Colusa. This would add to the central group about 12,000 kw. at 80 per cent load factor. To accomplish this, however, an exchange of energy between the California-Oregon Power Company and the Northern California Power Company is necessary and an investment of about \$980,000 in an interconnecting line.

The committee from the northern division specially urged upon the Railroad Commission "the necessity for some affirmative action which will tend to the further development of possible hydroelectric plants in California, both along the lines of financial encouragement to the companies and affirmative aid in Congressional legislation regarding the occupancy of public lands such as would be calculated to make hydroelectric developments attractive to those who must finance the development."

The report from the southern division stated that the Southern Sierras Power Company and Southern California Edison Company systems had been put under a single power dispatcher so far as exchange of energy is concerned. In its previous report the southern division committee reported that 1917 fuel consumption, amounting to 1,056,000 bbl. of oil, could be reduced in 1918 to 600,000 bbl. The report of Jan. 31, however, states that more recently means have been found for reducing 1918 consumption to 275,000 bbl.

These additional economies have been worked out after running tests on steam-plant efficiency in order to determine where fuel oil can be used to best advantage, by comparing power transmission systems and load curves to find where and when energy can be exchanged advantageously, and by increasing the load on plants where additional capacity is available.

PROGRESS TOWARD TYING IN THE CALIFORNIA SYSTEMS

**Results of Inquiry Into Possibilities of War Conser-
vation and Economy by Co-operation in
Southern California**

Negotiations between California electric generating systems and the California Railroad Commission looking to the combination of transmission lines and other means of co-operation to save fuel were reported in the ELECTRICAL WORLD for Jan. 26, 1918, page 218. Reference was made in that article to the report submitted by R. H. Ballard, general manager Southern California Edison Company, for the committee which has been studying conditions in the southern part of the State.

The inquiry into the possibilities of war conservation and economy by co-operation in the use of resources and facilities by power companies of the southern San Joaquin Valley and southern California covered the following properties: Southern California Edison Company, Los Angeles Gas & Electric Company, Los Angeles Aqueduct, San Joaquin Light & Power Corporation, Mount Whitney Power & Electric Company, Southern Sierras Power Company and San Diego Gas & Electric Company.

For the purposes under consideration, the Santa Barbara Gas & Electric Company and the Ventura County Power Company were considered part of the Edison system.

The accompanying table shows the amounts of power generated by steam in 1917 and which must be generated by steam in 1918 to 1921 inclusive, and the amount of natural gas and fuel oil that must be burned to generate the required steam power in the event that no additional hydroelectric developments are completed during the period. The amounts of natural gas listed are those used by the Edison company and Los Angeles Gas & Electric Company, and include amounts which the San Joaquin company is now preparing to utilize. The table is based on average water conditions. A low-water year would increase the steam power necessary.

Year	Millions of Kilowatt-hours			Per Cent Steam	Fuel Necessary	
	Total	Available Water Power	Balance by Steam		Millions of Feet of Gas Available	Bbls. Oil for Balance
1917	1,146	911	235	21.5	1,400	1,056,000
1918	1,270	1,087	183	14.4	1,800	600,000
1919	1,410	1,110	300	21.3	2,100	1,150,000
1920	1,565	1,110	485	29.1	2,100	1,925,000
1921	1,715	1,110	605	35.3	2,100	2,675,000

The table shows a notable reduction in steam power for 1918 under 1917. The causes of this reduction as stated in the report are:

The Edison company has completed an increase in its Huntington Lake reservoir which will enable it to store an additional 35,000 acre-feet.

Arrangements were made some time ago for interconnection between the Edison and Southern Sierras companies,

the San Diego and Santa Barbara companies. A 5000-kw. frequency changer has been installed for interchange of power between the Edison and Southern Sierras. A line is being constructed to supply all the requirements of Santa Barbara Gas & Electric and is now carrying part of the load of that company; the balance will be carried as soon as the construction work can be completed. Substation apparatus has been purchased and lines are now in process of construction for the installation of two 5000-kw. frequency changers at Capistrano for interconnection between Edison company and San Diego company. By the foregoing means all the companies mentioned will be able to share in the benefits of diversity of load and power resources.

The Edison company has arranged to transmit a small amount of natural gas to its Redondo plant.

The San Joaquin company has purchased and is preparing to lay a pipe line to its Bakersfield steam plant, which will enable it to utilize 600,000,000 ft. of gas per year, one-half of which will be available in 1918 and the whole amount in 1919.

Increases in load will enable Southern Sierras to utilize about 9,000,000 kw.-hr. and San Joaquin 26,000,000 more kw.-hr. from the available water during the run-off season. During 1918 it will be possible for the companies to make some additional arrangements for utilizing flood-water kilowatt-hours.

	Kw.-hr. per Year	Equivalent Barrels of Oil
1. The city of Los Angeles has some small plants in Owens River valley which can be connected to the Southern Sierras system, furnishing	10,000,000	50,000
2. Some of the San Joaquin surplus can be used by Mount Whitney.....	7,000,000	35,000
3. Arrangements can possibly be made for Edison company to use any surplus power San Joaquin may be able to generate from gas at its Bakersfield plant, equal to	30,000,000	150,000
4. It is possible that the Edison company can do some of the regulating for Southern Sierras, which will not amount to any large quantity of kilowatt-hours, but will save standby oil. No value can be put on this until it is tried.		
Total	47,000,000	235,000

The allowances for 1919 and following years take into consideration the utilization of at least 23,000,000 kw.-hr. additional water power from the above sources. Any further betterment of conditions must come from additional hydroelectric developments.

For the years following 1918 the various companies have under consideration possible hydroelectric developments, which in conjunction with the available natural gas resources could save the equivalent of the entire oil requirements for 1921.

	Kw.-hr. per Year	Equivalent Barrels of Oil
1. The most immediate of these is the possibility of installing certain plants on the Los Angeles aqueduct which are partly developed and which could be ready by 1919, capable of supplying..	100,000,000	500,000
2. The Edison company has a program of development on Kern River and Big Creek for completion in 1919, 1920 and 1921, which can supply.....	400,000,000	2,000,000
3. San Joaquin can construct plants on the San Joaquin and Kings River, which can supply	200,000,000	1,000,000
4. Southern Sierras can complete plants to supply	150,000,000	750,000
Total	850,000,000	4,250,000
The total estimated cost of the proposed developments is approximately.....	\$30,000,000	

It will be noted that with proper interconnections between the companies the developments considered in the last table are capable of producing 850,000,000 kw.-hr., or 245,000,000 more than the 605,000,000 which must be produced by steam in 1921 if hydroelectric development is not carried out. This surplus would be available for additional growth of the

companies and it would not be necessary to complete some parts of the proposed developments until the load became sufficient to absorb the output.

Extensions of distributing systems are taken up in the report. During the emergency created by the war, and in view of the present shortage of money and expected shortage of materials, extensions of distributing systems, aside from very minor extensions, should be confined to extensions to serve consumers whose business contributes directly or indirectly to the winning of the war, the committee says. For the present, and until the shortage of materials becomes more acute, extensions to prospective consumers willing to deposit a substantial part of the cost of extensions, to be refunded in service, or the gross income from which will equal the cost of the extension in two years or less, might be made.

In southern California approximately 90 per cent of the electric energy sold is used for street and inter-urban railways, irrigation for agriculture, cement manufacture, oil-well pumping, shipbuilding and minor power service, all of which are war necessities.

It is suggested by the committee that the commission consider the question of passing upon applications of the utility companies for priority shipments for the purpose of giving the applications more standing before the Priority Board in Washington and eliminating the present apparent necessity for individual efforts in securing priority.

The financing problem, says the report in conclusion, is by far the most important one to be met. Large amounts of money are needed to permit of either the conservation of fuel oil or the development of water power for war purposes. No practical method of financing has as yet developed to provide funds for additional water-power plants contemplated. If a priority board were created by the United States government to pass upon the sale of securities, precedence would undoubtedly be given the sale of those securities which would provide funds for hydroelectric developments and the requisite extensions for the conservation of fuel oil, the development of agricultural lands, or other war necessities. The question of necessity might be certified by the commission for submission to such a priority board.

HIGHER RATES TO COVER COAL, MATERIALS AND LABOR

Sayre Electric Company Increases Schedule to Take in Other Elements of Increased Operating Expense Besides Fuel

The Sayre (Pa.) Electric Company has filed an increased-rate schedule with the Pennsylvania Public Service Commission. It covers higher costs of coal, other materials and labor. All meter rates, other than those for temporary service, are to have variable charges added, as follows:

A charge of 0.6 mill per kilowatt-hour will be added for each 25-cent increase in the cost of coal above \$3.70 per gross ton delivered at the plant of the company.

A charge of 1.5 mills per kilowatt-hour will be added to cover the increased cost of labor and material.

In like manner for every 25-cent decrease in the cost of coal below \$3.70 per gross ton delivered at the plant of the company the price shall be reduced 0.6 mill per kilowatt-hour of electricity consumed.

ILLINOIS COMMISSION ACTS ON CREDITS AND DEPOSITS

Tentative Rules Promulgated for Hearing at Springfield This Week Governing Electric, Gas, Water and Heating Service

The Public Utilities Commission of Illinois set Feb. 13 as the date for a hearing at Springfield on tentative rules governing the establishment of credits and the collection and handling of consumers' deposits for electric, gas, water and heating service.

The features of the tentative rules which the commission has worked out are that before rendering service the utility shall require each customer to establish his credit, that the amount of the cash deposit shall be equal to the average bill, including prompt payment discount for a periodic billing period plus thirty days, that the minimum cash deposit is fixed (except for power and heating service) at \$3 for residence customers and \$5 for business customers, that twenty days is established as the period which shall elapse between the issuance of a bill and the date on which the customer is adjudged delinquent, that prompt payment of all bills for twelve months permits the customer to demand and receive his cash deposit, and that interest at 6 per cent shall be paid on all deposits held by the utility for more than six months.

ALLOWING HIGHER RATES TO RELIEVE EMERGENCY

Method of Illinois Commission in Giving Relief to Utility Which Must Raise Power Rates to Meet Rising Costs

The State Public Utilities Commission of Illinois, deciding on the petition of the East St. Louis Light & Power Company for authority to increase wholesale power rates, expedited the case by making a comparison of the rates with other rates. The commission said in part:

There is submitted in the record no valuation. The usual procedure might involve a valuation and an analysis of the operating expense. The record contains little such information except that relating to increased expenses of operation.

It must be realized that, owing to high prices of fuel, labor and the materials necessary for carrying on utility operation, public utilities must have experienced increases in operating expenses. This fact in itself, however, does not offer justification for an increase of rates, since it is possible that the rates heretofore charged under more normal conditions which have previously existed were exorbitant or excessive. If, however, it can be reasonably shown that the rates heretofore in effect under normal conditions have not been unreasonably high, then the problem is narrowed down to a determination of whether the rates proposed will give increased revenue of an amount which will adequately, but not unreasonably, reimburse the utility for the increases of operating expense that obtain, and whether the proposed rates are of a non-discriminatory and equitable character. In a number of such cases the commission has entered orders fixing rates for utility service. A comparison with rates so fixed and determined offers an opportunity for the formation of judgment which may be sufficiently accurate in many cases.

Testimony shows that the average cost of coal delivered at the company's plant during the first nine months of 1916 was \$1.25 per ton; during the first nine months of 1917 the cost was \$1.87 per ton. The company estimates, upon the basis of contracts which it has and the present prices prevailing, that the average cost of coal used by it from Nov. 1, 1917, to April 1, 1918, will be \$2.69 per ton, and that after

April 1, 1918, when all of its present coal contracts will have expired, this cost will be \$2.74 per ton.

After a comparison of the power rates with those in other communities and finding that East St. Louis rates were lower, the commission pointed out that the rates it contemplated were applicable only to wholesale power service, and stated:

Power service in general, and wholesale power service in particular, is a competitive class of service for the reason that consumers of power service are usually in a position to utilize power furnished by other means. The "value of the service" to the consumer is an element to be properly recognized in the development of rates for utility service, at least to the extent that it fixes a maximum above which rates cannot be fixed with the hope of securing business.

The commission ordered suspension of the company wholesale rates in order that new and higher rates might be effective as of Jan. 1, 1918. The commission will retain jurisdiction in order that changes of conditions as they may arise may be cared for adequately. The commission reserves the right to re-open this case if in its opinion conditions warrant.

CONSTRUCTIVE REGULATION IN THE PUBLIC INTEREST

Empire State Gas and Electric Association, Calling Attention to Destructive Railroad Regulation, Urges Efficiency

Declaring that the suspension of industries is due to freight congestion arising primarily from railroad regulation and urging the importance of constructive regulation of utilities to promote efficiency and prosperity, the executive committee of the Empire State Gas and Electric Association has sent the following resolution to the United States Chamber of Commerce:

Whereas the federal government, through the United States Fuel Administration, has found it necessary temporarily to close down business in the eastern part of the country in order to relieve freight congestion and insure thereafter a continuous flow of coal and other articles necessary for domestic use, for the use of our army and navy, and for export to our allies in the war; and

Whereas the present freight congestion is, in our judgment, due to a long period of regulation of the railroads, by state and federal authorities, of a character which has been unnecessarily burdensome and restrictive and which has impaired the credit of the railroads, thereby preventing them from securing promptly and at reasonable prices the capital needed for extensions, additions and improvement; and

Whereas all other public utilities, including electric railways, gas corporations, electric light and power corporations, telephone and telegraph companies, water companies, etc., are also of vital necessity to the country not only in times of war but also in times of peace and are now almost everywhere subject to regulation by governmental bodies; and

Whereas these utilities can render the maximum service only if their credit is maintained and they are enabled to secure capital promptly and at reasonable rates, now be it

Resolved, that we request the Chamber of Commerce of the United States to lay this matter before the business men and business organizations of the country, suggesting that they as users of the service rendered by such utilities express themselves to federal and state legislative and regulatory bodies in opposition to restrictive regulation but in favor of regulation which will encourage efficiency, prosperity and co-operation as being in the public interest, and which will see to it that such prosperity and efficiency inure to the benefit of the public, to the end that further calamities due to the inability of the public utilities to meet the demands of the public may be averted.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

The Southwestern Electrical and Gas Association.—This association will hold its annual convention April 15 and 16 at Galveston, Tex. H. S. Cooper of Dallas, Tex., is secretary of this association.

New York Chapter of American Association of Engineers.—Hudson H. Bubar of the National Aniline & Chemical Company addressed the New York Chapter of the A. A. E. recently on "The Engineer: His Present and Future."

Los Angeles Synchronous Club.—"Illumination" was the subject of Lecture No. 8 in the synchronous electrical course given at the Feb. 7 meeting by Prof. A. W. Nye, head of the physics and electrical engineering department, University of Southern California.

Pittsburgh Section A. I. E. E.—On Feb. 13 C. E. Wilson, automotive engineer, Westinghouse Electric & Manufacturing Company, addressed the Pittsburgh Section of the American Institute of Electrical Engineers on the subject of "Electrical Equipment on Government Standardized Trucks." G. M. Baker is secretary of this section.

San Francisco Electrical Development and Jovian League.—The league at its Feb. 6 meeting celebrated the birthday of Thomas A. Edison. Frank D. Fagan, Pacific Coast manager Edison Lamp Works, gave an interesting talk on incidents in Mr. Edison's life, illustrated by moving pictures. E. M. Cutting, Pacific Coast manager Edison Storage Battery Supply Company, was master of ceremonies.

Louisville Jovian League.—At the annual meeting and banquet of the Louisville (Ky.) Jovian League there was an attendance of nearly 100. A spirited election with two tickets, a so-called regular ticket and a "camouflage" ticket, was held. Walter S. Clark of the James Clark, Jr., Electric Company, was elected to serve a year as president, succeeding himself. He was elevated to the presidency last fall on the removal from the city of F. V. Gantt, the previous president. On the ticket with him were elected C. C. Childers of the Childers Electric Company, vice-president, and Paul C. Tafel of the H. C. Tafel Electric Company, a director. From the other ticket were elected S. B. Storm of the local branch of the General Electric Company, secretary-treasurer, and the following directors: James Clark, Jr., of the James Clark, Jr., Electric Company; C. A. Klemm, branch manager of the Westinghouse Electric & Manufacturing Company, and I. Dreyfus of the Louisville Gas & Electric Company.

Officers of the American Washing Machine Manufacturers' Association.—At the second annual meeting of the American Washing Machine Manufacturers' Association, Jan. 23 and 24, 1918, the following officers were elected: President, W. H. Eden, Brokaw Eden Manufacturing Company, Alton, Ill.; first vice-president, H. W. Barker, 1900 Washer Company, Binghamton, N. Y.; second vice-president R. D. Hunt, Drexler Company, Fairfield, Iowa; third vice-president, John Rocks, Meadows Manufacturing Company, Pontiac, Ill.; treasurer, W. H. Voss, Voss Brothers Manufacturing Company, Davenport, Iowa. The executive committee members are W. J. Conlon, Conlon Electric Washer Company, Chicago; W. L. Rodgers, Pittsburgh Gage & Supply Company, Pittsburgh; J. D. A. Johnson, Michigan Washing Machine Company, Muskegon, Mich.; F. H. Bergman, One-Minute Manufacturing Company, Newton, Iowa, and H. G. Braunlich, H. F. Brammer Manufacturing Company, Davenport, Iowa. On the advisory committee are Sam T. White, White Lily Manufacturing Company, Davenport, Iowa; L. E. Dietz, Boss Washing Machine Company, Cincinnati, Ohio, and E. H. Maytag, Maytag Company, Newton, Iowa. Messrs. Eden, White, Dietz, Johnson and Rodgers are the war service committee. Raymond Marsh, 10 South LaSalle Street, Chicago, is secretary.

Gilchrist Speaks on Financial Problems.—John F. Gilchrist, vice-president Commonwealth Edison Company, Chicago, speaking at a recent meeting of the Indiana Engineering Society at Indianapolis, characterized the financial problem of the public utilities as the most important before them. The government has become aware, he said, that power is of use in the war and that it must call out a greater power than man power to maintain the men at the front. Public utilities, therefore, are among the essential industries as regards war work. In the discussion H. O. Garman of the Indiana Public Service Commission stated that a number of Indiana companies are already insolvent on account of increasing cost of operation. Mr. Garman also argued against extensions to outlying districts, stating that these are not necessary inasmuch as the average American city has not been built up intensively and contains much waste space. G. W. Hubley of Indianapolis cited figures on increasing costs to show that the more common materials had increased all the way from 20 per cent for common brick to 199 per cent for copper, while the wages paid laborers had advanced from 25 to 50 per cent with a decrease in the effectiveness of the workers. W. S. Moore, state highway engineer for Indiana, was elected president of the Engineering Society; G. A. Young of Lafayette was elected vice-president, and J. S. Wilkins of Connorsville and W. H. Insley of Indianapolis were made members of the board of trustees. Charles Brossman of Indianapolis was re-elected secretary.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Rates Suspended in Illinois.—The Illinois Public Utilities Commission has suspended the increase asked by the Madison County Light & Power Company, Carlinville, until March 31; also, to the same date the increase in rates proposed by the Abbott Light & Power Company for Petersburg, Mason City, Tallula and Ashland.

Need of Proper Capital Authorization.—A decision has been rendered by the New York Public Service Commission, Second District, on the petition of the Groton Electric Power Corporation for permission to construct a plant in Groton and near-by communities. The commission ruling, in brief, follows: "An electric company applied for permission to construct and for approval of franchises in certain villages and towns where there is a decided need for electric service. The company was not yet fully organized as a corporation. It had filed its certificates but had obtained no authorization for capital stock from this commission. In the circumstances it was held that the application should be granted but that no construction should be undertaken until proper capital authorization from the commission should be secured."

Power Supply in Portland, Ore.—The power situation is discussed incidentally in a decision of the Oregon Public Service Commission affecting the Portland Railway, Light & Power Company. "It is evident," says the commission, "that even at this time the power supply is but little, if at all, in excess of the demand, after making allowance for a proper reserve. But now, after a period of comparatively slow growth, the demand for power is increasing rapidly. The Northwestern Electric Company has just announced its intention to build a 10,000-kw. steam plant in the city, and it is reported that it will also add a small hydro plant on the White Salmon River. But these will not more than take care of the anticipated increase of the next one or two years. With the advent of the shipbuilding industry and the great improvement in the lumber business and kindred lines, a large increase in industrial activity is confidently looked for. If this growth is not to be blighted by inability to supply power for it, it is essential that the development of additional power on a large scale be undertaken in the very near future, and to this end it is necessary that the utilities engaged in the supply of power shall be maintained in such credit as will enable them to obtain the funds required for such development."

Doherty Headquarters in Washington.—The Doherty Men's Club has been established at 1329 K Street, N. W., Washington, for the convenience of men of the Doherty Organization who have occasion to visit Washington.

Purdue Includes More Army Work.—As the result of a conference held in Washington upon the request of the Signal Corps, U. S. A., Purdue University decided to inaugurate an additional signal course. It began with the second semester of the school year, Feb. 1. The course will be under the direction of Prof. C. Francis Harding, professor of electrical engineering.

Byllesby Men in National Service.—A "national service record" of employees of H. M. Byllesby & Company and affiliated employees as of Jan. 1, 1918, shows: Number of male employees at properties, all ages, 4839; number enlisted, 317; number drafted, 79; number subject to draft not yet called, 996; total number of men in active service, 393; percentage of men in service of entire male forces employed, 8.1 per cent.

Research Fellowships in the Engineering Experiment Station, University of Illinois.—To extend and strengthen the field of its graduate work in engineering, the University of Illinois maintains fourteen engineering experiment station research fellowships. One other such fellowship has been established under the patronage of the Illinois Gas Association. The fellowships, for each of which there is an annual stipend of \$500, are open to graduates of approved American and foreign universities and technical schools.

Asks Suspension of Extension Regulations.—A. D. Mackie, general manager Springfield (Ill.) Gas & Electric Company, has asked the Illinois Public Utilities Commission to suspend general rules Nos. 19 and 31 as applied to public service corporations. Section 31 provides generally that an individual or group of individuals may compel building and maintenance of lines for transmission of electric power, subject to certain regulations. Section 19 applies similarly to gas installations. Mr. Mackie asks suspension of these during the war. He says that cost of construction, materials and labor is so high as to make service extensions unprofitable in most cases.

University Extension Course in Fuel Economy.—To overcome the great wastage in fuel in Massachusetts because of lack of expert knowledge by firemen and others who use coal in large quantities, the Department University Extension, State Board of Education, organized a class in power plant economics, scheduled to begin sessions on Feb. 4, at the State House, Boston. James A. Moyer, director of the department, said that the principal object is the distribution of easily understood information of how to obtain full worth from every pound of fuel in industry. The course is to be given by J. J. Eames, instructor in mechanical engineering in the department of university extension, under the auspices of the Massachusetts Institute of Technology.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Increase Rates in Mobile.—The Mobile (Ala.) Electric Company has increased electric rates, effective Feb. 1, owing to increased operating expenses caused by the war.

Illinois Rate Increases.—The petition of the Public Service Company of Northern Illinois to increase electric light and gas rates in 140 towns and cities has been received and reviewed by the Illinois Public Utilities Commission. The commission has postponed the effective date of the increase until June 28, 1918.

Guide for Electric Vehicle Owners in New York.—The New York Edison Company, through the automobile bureau, is distributing the 1918 edition of the charging station booklet. The book is especially valuable as it shows several new charging stations in the suburbs. In addition it describes the electric vehicle route to Atlantic City. There are several additions of interest in the 1918 compilation.

Cleveland Rate Case Before Commission.—The hearing on the city of Cleveland appeal for reduction of the Cleveland Electric Illuminating Company rate was resumed before the Ohio Public Utilities Commission on Jan. 29. After partial cross-examination of Robert Lindsay, general manager, the hearing was adjourned to Feb. 20. The city contended that its engineer, F. W. Ballard, had not had sufficient time to prepare his review. Company attorneys informed the commission that the company would probably be compelled to discontinue the steam-heating business unless allowed to raise rates.

Water Power at Sault Ste. Marie.—The Sault Ste. Marie (Mich.) Civic and Commercial Association writes to the ELECTRICAL WORLD: "All the large industrial plants at Sault Ste. Marie are running as usual under special exemption by Dr. Garfield and W. K. Prudden from their recent drastic fuel orders. These plants are operated by electricity produced by water power from the rapids of the St. Mary's River. The Michigan Northern Power Company and Edison Sault Electric Company produce and distribute about 40,000 hp. from these rapids. This power is used to operate all industries of any size at the Sault. There is now immediately available at the Sault about 1500 hp., which can be increased to 4500 hp. upon very short notice and the installation of the type of machinery most efficient for the operation of any particular industry. Under the present fuel conditions this available water power is of great economic advantage to manufacturers who are or may be embarrassed for lack of fuel."

New Rules for Priorities.—The priorities division of the War Industries Board of the Council of National Defense has issued new rules and regulations governing priority. They set forth that "the paramount purpose of priorities is the selective mobilization of the products of the soil, the mines and the factories for direct and indirect war needs in such a way as will most effectually contribute toward winning the war. In requesting priority the petitioner should join the committee in applying this test: To what extent, if at all, will the granting of this application contribute, directly or indirectly, toward winning the war; and if at all, how urgent is the need?"

Appeal to the Public in Illinois.—A united appeal to fair and unbiased public opinion has been made by the Illinois State Electric Association, the Illinois Gas Association and the Illinois Electric Railways Association. The three associations are using direct newspaper appeal to the people for a fair deal in the matter of rapidly increasing costs of operation in view of a steady and inflexible revenue account. They point out especially that while utilities should not be allowed to make unjust profits on large amounts of watered stock, they should be allowed to earn a revenue fully commensurate with greatly increased costs of operation and should be protected against soaring prices of labor and materials by higher rates. The appeal has appeared in a number of prominent Illinois daily newspapers.

Engineers in Government Service.—During the last few months the Engineering Council, through its American engineering service committee, has supplied to various government departments and bureaus several thousand names of engineers from which men were to be selected for positions in uniformed and civilian service for the army and navy and other government activities in connection with the war, as well as for indirect service for manufacturers and contractors in government war work. To meet these demands the American engineering service committee assembled in its offices, Engineering Societies Building, New York, extensive lists and detailed information concerning engineers in all branches of the profession throughout the land. If these lists are to be maintained in the most useful condition to the government and the Engineering Council the committee should receive prompt information concerning each engineer who has gone into any kind of government service, direct or indirect. Engineers to whom this request applies are urged to send at once their names, present addresses and occupations in the government service, with brief statement as to whether or not they are available for other service, to the American engineering service committee, Room 901, 29 West Thirty-ninth Street, New York. Other readers are asked to bring this request to the attention of such engineers or to send information directly to the committee named.

Henry Bostwick, formerly secretary to the vice-president and general manager of the Pacific Gas & Electric Company, has been chosen to succeed G. C. Holberton as manager of the San Francisco district of the company.

George C. Holberton, for several years manager of the San Francisco district of the Pacific Gas & Electric Company, has handed in his resignation, effective Feb. 1. Mr. Holberton is retiring in order to devote all of his time to private affairs.

J. M. Hannaford, Jr., vice-president and sales manager of the Northwestern Electric Equipment Company, St. Paul, Minn., has resigned to enter the firm of Gordon & Ferguson, St. Paul. Mr. Hannaford has been with the Northwestern company for nine years.

Z. Starr Cohen, who has been connected with the Northern New York Utilities, Inc., at Watertown, has been appointed manager of the Wetmore Electric Company at Lowville, N. Y., a subsidiary of the Northern New York Utilities, Inc. Mr. Cohen succeeds George R. Dorsey, who has resigned.

H. W. Deininger, for several years vice-president and general manager of the Sac City Electric Company and for the last two years manager of the Sac City district for the Iowa Light, Heat & Power Company, has resigned to become general superintendent of the Iowa Southern Utilities Company, with headquarters at Centerville, Iowa. Prior to entering the electric utility field Mr. Deininger was general manager of the Globe Machine & Supply Company.

Frank L. Lucas, president-elect of the Western Association of Electrical Inspectors, started in the electrical busi-

F. L. LUCAS

ness in 1884 as an electrician in Detroit, Mich. Later he went to Toledo as superintendent of construction for a contracting firm. In Toledo he helped to organize the inspection department of the city and made the first municipal electric inspection. In July, 1917, after eleven years of service, he resigned to go into business for himself in Toledo. In addition to his inspection activities, he was also connected with the La France Electrical Construction & Supply Company of that city.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

J. J. Gorman has been appointed new-business manager of the Citizens' Gas & Electric Company, Waterloo, Iowa.

W. Porter Jones has resigned as manager of the Oklahoma Gas & Electric Company at Norman, Okla. Prior to becoming manager at Norman a year ago Mr. Jones was new-business manager of the company.

B. E. Morrow, who has recently been elected a director of the National Safety Council, has always been an ardent advocate of safety work and the prevention of industrial accidents. He has been very active in this work, having been a member of the committee on dangerous machinery appointed by the Department of Labor, New York City; a member of the committee on accident prevention of the National Electric Light Association and chairman of the safety practices committee of the public utilities section of the National Safety Council. Mr. Morrow is one of the pioneers in the electrical industry, having been connected with the Edison Electric Company at Schenectady in its early days. After the consolidation of that firm with the present General Electric Company he had charge of the electrical testing department. In 1902 he resigned from the General Electric Company to take charge of the operating department of the Hudson River Power Transmission Company, the principal generating station of which at that time was on the Hudson River at Mechanicsville, N. Y. In 1903 this company, with several others, was merged into what was known as the Hudson River Electric Power Company, with hydroelectric plants at Spier Falls, Mechanicsville and Schoharie Falls and a 6000-kw. steam generating station at Utica, N. Y. While connected with this company Mr. Morrow made an extended trip to the Middle Western States and to Canada with Dr. Steinmetz, Professor Creighton and other prominent engineers to inspect lightning arresters on high-tension transmission lines. This was before the advent of the aluminum-cell lightning arresters, and the multigap arresters then in use were the cause of much anxiety on the part of engineers. In 1910-11 he was chairman of the N. E. L. A. committee on protection from lightning and other static disturbances, and he has served on many other important committees. At the present time he is a member of the N. E. L. A. committee on inductive interferences. In 1915 Mr. Morrow was appointed manager of the production and transmission department of the Consumers' Power Company, Jackson, Mich., a post he still holds.

F. D. Beardslee has resigned as sales manager of the Union Electric Light & Power Company, St. Louis, Mo., to become manager of the department of public relations of the Mercantile Trust Company of St. Louis. He will retain the position of assistant secretary of the Union company on consultation matters. Mr. Beardslee has been connected with the lighting company since 1889, having started as a boy.

A. B. Boynton, district manager of the Electric Machinery Company for New York and New England, has re-

A. B. BOYNTON

cently been commissioned captain in the Engineer Officers' Reserve Corps. Captain Boynton is a graduate of Cornell University in electrical engineering and for the last twenty years has been engaged in engineering and sales work in the electrical field.

H. E. Hobson, an electrical engineer, who was superintendent of construction for Sampson & Allen of Lynn, Mass., for seven years, general manager of the Central Hudson Construction Company for three years and general manager of the Poughkeepsie Utilities Corporation for the last four years, has been appointed by the Underwriters' Association of New York State as an electrical inspector. Mr. Hobson will have charge of the electrical department in the branch office of the association at 45 Market Street, Poughkeepsie, N. Y.

Obituary

M. G. Potts, formerly connected with the Lykens Valley Traction Company, Williamstown, Pa., in the capacity of treasurer and general manager, died Jan. 18 at his home in Harrisburg, aged seventy-three years.

B. Frank Hires, formerly connected with the Bridgeton & Millville Traction Company and the Bridgeton Electric Company, Bridgeton, N. J., in the capacity of general manager, died Jan. 18, aged fifty-nine years. Mr. Hires was appointed special agent in the spring of 1917 for the American Railways Company, which operates the above properties.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

SERVICE CHARGE FOR THE SMALL ACCOUNTS

Suggestion Is Made that Customers Be Advised to
Trade with a Lesser Number of
Distributing Houses

A Middle Western jobber, through circular letters and through his salesmen, is telling customers the cost of handling small orders and is giving the reason for asking a 10 per cent service charge on returned goods. This jobber recently stated that he had yet to find an instance wherein a customer objected to such policy. Moreover, he expressed a high appreciation of the attitude taken by competitors, who evidently instructed salesmen not to use the knowledge of this campaign against his company. Evidently the competitors believed it to be constructive work which would promote their best interests as well as his.

This jobber is of the opinion that if every distributor would analyze his account, he could do much to overcome this fault by writing those customers who continue to send small orders repeatedly. He could ask for fewer orders but larger amounts at a time. In some cases it would be money actually saved if these jobbers would request the customer to trade with fewer houses. In this way some customers would cease trading; others would cease trading with competitive houses, and on the whole, it is believed, everybody covering the territory would be benefited. There is only a given amount of merchandise to be sold; each buyer has only a certain volume to place. If he places it with fewer houses, each house should profit because each will eliminate many small orders. Most distributors and salesmen, this jobber believes, get too anxious to sell merchandise, and overlook the necessity of analyzing their accounts and of discontinuing business that is not profitable to them.

FEDERAL RULES FOR OBTAINING PRIORITIES

Circular No. 3 Defines Rules for Determining Precedence in Orders and Work and Describes the
Methods of Administering Them

The priorities division of the War Industries Board of the Council of National Defense has made public Priority Circular No. 3, defining the regulations which the priorities division now has in effect for determining precedence in orders and work and describing the methods of administering them. The regulations are subscribed to by the Secretary of War, the Secretary of the Navy, the chairman of the Shipping Board and president of the Emergency Fleet Corporation and the chairman of the Council of National Defense. The circular discloses a much wider field of operations than that defined in the first circular issued in September of last year. The priority regulations apply to all individuals, firms, associations and corporations engaged in the production of copper, iron and steel and in the manufacture of their products; of chemicals, cotton duck and woolen cloth, and all such other raw materials and manufactured products as the committee may deem necessary from time to time.

Under the new regulation all orders and work are divided into four general classes instead of three as heretofore: Class AA, class A, class B and class C, with such subdivisions as class AA-1, class AA-2, etc., class A-1, class B-1, etc. Class AA comprises only emergency war work of a special or urgent nature.

The new regulations in no way change or modify any priority orders previously issued. The rule of procedure from now on is that orders and work in class AA shall take precedence of those in all other classes, orders and work in class A preceding those in class B and those in turn orders and work in class C, irrespective of the dates the orders were placed. The committee's work does not cover transportation, and it does not attempt to expedite transportation.

No industry, plant, material or commodity will be classified as such. Only specific orders for materials, commodities or work are classified according to their importance in war preparation or in work necessary to the public interest and essential to the national welfare, or otherwise of exceptional importance.

SUGGESTIONS FOR EXPANDING SOUTH AFRICAN EXPORT TRADE

Preference for Higher-Class Merchandise — The
Manufacturer's Agent Is Found a Better
Medium than Exclusive Sales Houses

A manufacturer's agent at Johannesburg, South Africa, in writing of trade conditions to the *ELECTRICAL WORLD*, makes some observations that are intended to be of direct interest to American manufacturers in the advancement of their export business. In a preliminary way he asks how American manufacturers are viewing the coming keener competition that they must necessarily meet after the war from Great Britain and continental Europe, not to mention Japan, all now competing in electrical goods in this and other markets. The belief expressed is that American producers will have largely to change their methods.

Following a brief description of the peculiar character of the population and of the communities, the correspondent says that largely the towns began where the Old World left off. Apart from three or four, gas is unknown, and even in these electricity has the foremost place because of its convenience and moderate cost. The smaller towns, some of which cannot be described otherwise than as villages, are installing both electric light and electric power, while the great gold mines of Johannesburg and the diamond mines of Kimberley are worked from electric power stations.

The demand for the conveniences which electricity makes possible is rapidly growing and the preference is for the higher-class articles. In meeting this demand America is well represented, but there are still possibilities untouched. A more intimate knowledge and a closer survey of the field would benefit American manufacturers, and provided that they would admit that policies adapted to their domestic market may not always be the best for the export territories, they could do still better. South Africa is emphatically a market in which the manufacturer's agent should be employed as opposed to the practice common with American firms of granting sole agencies. The outlook for the next few years is undoubtedly brighter than it has been hitherto in that country.

Individual electric lighting plants are in growing demand, and these will be followed by a desire for the various conveniences which help to lessen the labor of housework, as the servant question is as acute over there as it is in the United States. Such plants must be non-complicated, of strong construction, and use kerosene as fuel, for gasoline costs to-day \$1.02 per imperial gallon. If equipped with storage batteries and attachments for driving the churn or butter worker, this would be an additional selling point.

Unfortunately, South African electric service has not been standardized, and the merchant has to provide for the fact that the voltage in the different towns is not alike. Even in Johannesburg it differs in different portions of the town. It might also be well to remind American manufacturers that only the bayonet socket is in use in South Africa, the screw, so common in the States, being unknown.

THINGS TO BE CONSIDERED IN TAKING GOVERNMENT WORK

Information Concerning Localities in Which Orders Will Not Be Placed and Effect of Other Government Orders

In the matter of placing contracts for goods for government use, the General Engineering Depot, Washington, D. C., in asking for bids is requiring of bidders, "because of the known shortage of power in certain manufacturing districts and in order to conserve this power for the rapid completion of government contracts already under way," to state on demand the localities from which the materials entering into the manufactured articles are obtained. The purchasing officer in this way reserves the right in making awards to discriminate against those bidders who are dependent for their materials upon the manufacturers in congested districts.

In addition, in order that there may be no congestion in factories and that there may be more equitable distribution of goods, bidders are required to state in writing upon the request of the purchasing officer, after proposals are opened, the total money value of uncompleted orders placed with them by the United States and the allied governments. In addition, bidders must also state at that time the class and number of principal and subsidiary priority orders which may have been issued on their manufactured goods affecting directly or indirectly articles upon which they are bidding.

METAL MARKET SITUATION

Copper Shipped Regularly—No Strain to Meet the Demand—Wire Steady and Firm

With the change in weather conditions shipments of copper are being made more regularly. An authority states that if surface appearances are to be trusted, the trade, as regards supply and demand, will be under no strain for the metal in the near future. Wire is now figured on a 30-cent base, with practically negligible fluctuation. A large distributor reports that a special discount is conceded to heavy buyers of rubber-covered, base, weather-proof or cable. Each transaction is considered individually. The embargoes are upsetting all calculations on shipments and deliveries. An improvement, however, is looked for.

Shortage of tin is causing anxiety in metal circles. None is expected before March, only 200 tons having reached here from the Straits from Feb. 1 to Feb. 8. Old metals are steady, with a better price being quoted for heavy brass and scrap zinc.

NEW YORK METAL MARKET PRICES

THE WEEK IN TRADE

BARRING the embargoes and freight congestions which in some sections, particularly along the Atlantic seaboard and Pacific Coast, are distressing, business in the electric line is most encouraging. Contracts for equipment and goods of every description for shipyards, industrials and housing are running into the highest figures known. In the distribution of sales the entire trade is participating, either directly or indirectly. The approach of spring is therefore regarded with equanimity by manufacturers, distributors, jobbers and dealers.

Stocks are reported in satisfactory condition, with a few exceptions. A shortage of small motors is noted in some sections, with an ample supply and better deliveries elsewhere. Conduit of every size is in bad shape, with an increasing demand. Heating appliances, especially radiators, are having the best sale on record. Household specialties, especially sewing and washing machines, are also easy sellers.

Collections are holding up well, being reported as ranging from excellent to slow. Applications for credit are bearing the closest scrutiny, with jobbers refraining absolutely from financing doubtful prospects.

NEW YORK

A spirit of buoyancy is noted in the electrical goods field which freight congestions, embargoes, backward deliveries and fuelless days seemingly fail to affect. Jobbers and distributing companies are fortifying their stocks, and while it is difficult to keep all lines at full strength, owing to curtailed production in some instances and in other cases to transportation embargoes and delays, still the quantity of merchandise on the shelves or in warehouses represents a fair supply. Business is at least 50 per cent better than last year. Orders on hand are very heavy, in industries allied with iron and steel, for engineering equipment and electrical staples and specialties. Improved buying conditions are reported in the trade. Prices have been expected to recede in certain goods, but no tendency in that direction is yet noticeable.

Collections are accepted as being about as good as conditions will warrant, with dealers buying cautiously in view of the high level of prices. Credits are carefully looked after, so that the financial aspect of affairs is regarded as favorable.

CODE WIRE.—With building operations at the lowest ebb in several years the sale of code wire is not brisk. Rubber-covered, weatherproof and cable are in sharp demand, the price being figured on a 30-cent to 32-cent base. Producers are busy with large government orders, and their plants are taxed to meet specified shipping dates.

TORCHES.—There is an active market for torches for outdoor use by electricians and linemen. The advance of 10 per cent made Dec. 1 still rules. Deliveries by express are put through in a few weeks. To nearby points shipments are prompt.

COLLECTIONS AND CREDITS.—With the approach of spring an effort to place their collections in a strong position is reported among jobbers. Dealers are also taking the cue in their relations with the consumer. Credits continue to receive the attention their importance demands at this time.

MOTORS AND TRANSFORMERS.—Prices are unchanged, but up to 20 hp. motors are quite prompt in shipment. Transformers also show a like improvement.

LIGHTING FIXTURES.—Sales are reported as increasing in bowls, basins and shades with the approach of spring. Deliveries are subject to embargoes. On Feb. 1 the pack-

ing charge at the factory was advanced from 25 per cent to 33 1/3 per cent. Goods in this class are all quoted f.o.b. factory at buyer's risk.

CONDUIT.—Stock is running low. Prices are not considered, jobbers report, when buying. Delivery is the main question. There is no fixed price, and only emergency orders are now accepted by jobbing houses, which are not allowing any more conduit to pass out of their hands than cannot be avoided. There is any quantity of conduit at the mills, but embargoes cut off shipments. This applies to all sizes. When the weather eases off a few weeks of mildness will change the entire outlook. An order for 50,000 ft. was recently placed by a local utility, f.o.b. mill. The jobber who booked this nice piece of business said this is the only way to sell conduit nowadays. The risk is too great otherwise.

LAMPS.—Manufacturers are said to have caught up with the shortage variously described a short time ago. There is no stringency now, reports say, the producers having gone over stocks and made a better assortment for all concerned.

RADIATORS.—Goods have been coming into this market in such quantity that the heavy demand is now being taken care of.

HEATING CORD.—No. 16 heating cord is scarce. It is said the price is high and fluctuating. One manufacturer quotes \$38 to \$38.50, another \$29.70.

CHICAGO

Heatless Mondays, transportation troubles and inclement weather are leaving their marks on the trade in the Chicago territory. Among the manufacturers it is freely stated that the elimination of working days has cut down production. This decrease, moreover, has not been in direct proportion to the number of days involved. The decrease is greater than that ratio. This is due to several causes. First, it takes the men some time to get into the swing again after a day and a half lay-off. Moreover, electrical manufacturers find that other factories which supply semi-finished parts or raw materials are also hard hit by the shut-down delays and transportation tie-ups, so that hindrance arises here again.

This same situation can be traced through into the jobbing industry, where it will be found that goods promised for three weeks' delivery are taking five weeks or more to arrive at jobbers' warehouses. This, of course, increases the value and usefulness of jobbers' stocks in this territory. Certain jobbers are out of some lines that they themselves say they have no business to be out of. So far there has been no effort on the part of jobbers to raise prices to the trade on items in stock. As long as stocks hold out, it is said, they will be sold at existing prices.

In the city of Chicago for the week ending Feb. 6, 1918, there were issued 395 electrical permits, as against 620 for the same week last year. The 395 permits involved installations of 5044 incandescent lamps and 736 hp. in motors. Electrical permits for this year are running behind those of last year on the average, as is shown by the fact that 1850 were issued for the five weeks ended Jan. 30, 1918. Two thousand six hundred and twenty-three were issued for the five weeks ended Dec. 26, 1917, and 3260 were issued for the five weeks ended Jan. 30, 1917.

It is definitely known that one gun-carriage factory and two shell plants have signed up for central-station service in Chicago. The gun-carriage plant will have a total connected motor load of 2000 hp., and the shell plants will have 1500 hp. and 2800 hp. connected respectively. Two other similar plants are in contemplation which will have an aggregate of 5000 hp. These are expected to be signed up at any time.

COPPER WIRE.—The prices remain unchanged. Deliveries from jobbers to manufacturers are uncertain. Cars in transit are more than two weeks overdue.

CONDUIT.—Deliveries are still in a difficult state. "Shopping" is usually necessary to get any quantity of varied sizes.

PORCELAIN.—Owing to frequent warnings issued by manufacturers several months ago, the trade is well stocked in porcelain. It is not moving rapidly.

BOSTON

Jobbers report a fair volume of business this week, with a tendency toward less general trade. Government orders occupy the center of the stage and show no signs of diminution. The boom in shipbuilding is reflected in electrical sales along the coast. Collections are still slower than normal, and the use of trade acceptances is being discussed here and there, though as yet little appears to have been done toward their actual adoption. Credit men among the jobbers are making a study of trade acceptances, and some educational work is being done to acquaint jobbing-house salesmen with their principles and practice. Jobbers are carrying rather large stocks at present and are well prepared in most lines for the spring trade. The recent extremely cold weather resulted in another spurt in electric radiator sales. There is little improvement as yet in the New England coal situation, but the prospect for large shipments arriving by water at Boston this week was better than for some time. With New England more than 7,000,000 tons short, more or less industrial curtailment must be expected during the rest of the winter.

WASHING MACHINES.—Increasing interest on the part of the public is reported. While spectacular sales are absent, these machines are steadily coming into favor, and demonstrations by central-station solicitors and supply houses are yielding good results.

ELECTRIC RADIATORS.—These are among the season's "best sellers." One Boston jobber imported 1500 heaters just prior to the recent sub-zero weather and sold all but thirty in a week. Price advances earlier in the winter do not appear to have curtailed sales. These devices have been a godsend to New England in the period of coal famine.

LAMPS.—The situation is constantly improving. At present there is a heavy government demand for carbon incandescents for emergency work, because the supply of tungstens is low. A prominent manufacturer says that factory stocks are not accumulating much, except in "unpopular" sizes. Late price advances appear to have had little effect on the volume of business.

MOTORS.—Stocks are improving in sizes up to 15 hp.; in fact, something like normal conditions can be seen approaching in the small-motor market. No price changes are noted. About 80 per cent of the motor orders now placed are for alternating-current equipment. Motors of 50 hp. and over are still very scarce, and government demands continue unabated and beyond the capabilities of the manufacturer for prompt delivery.

MOLDED INSULATION.—Increasing difficulties in obtaining raw materials are noted at the factory, and the Monday shutdowns combined with railroad embargoes are hampering deliveries. Factory stocks are low. Price tendencies are upward, because of labor shortage.

ATLANTA

The Southeast is enjoying warmer weather this week, and a spirit of optimism prevails. The rising temperature will facilitate the railroads in moving quantities of freight that has been accumulating during the cold weather and which has been sidetracked for fuel movement. Some large shipments of electrical goods are being received by manufacturers and jobbers, which is evidence of the fact that good has come out of the fuel order. The rail embargoes and congestion in the East are being felt here, but on the whole goods are moving fairly well in this section.

Current opinion is that 1918 will be even better than 1917. It is true that 1917 sales were swelled by cantonment construction in the South, but the fact must not be overlooked that the government is just beginning to establish shipbuilding yards at the Southeastern ports. Jobbers already report good business from these centers, which may be considered as only a starter. The Foundation Company, Savannah, Ga., has just received an order for thirty-six mine sweepers. While the coastal cities will boom, a great deal of governmental activity will be felt inland also.

The wood distillates industry is coming along very fast and several plants are projected in Tennessee, two being at

Kingsport and one at Collinwood. These plants are capitalized for approximately \$4,000,000. It is also reported that a large amount will be expended in the phosphate business near Centerville, Tenn.

From figures available at this time the sale of wiring devices and small miscellaneous supplies in the Southeast showed a gain of approximately 60 per cent over 1916, and 2300-volt distributing transformers a gain of about 35 per cent.

CONDUIT.—Reports received from manufacturers indicate that a few factories are catching up on their stocks. Stock shipment has been promised from these sources, deliveries, of course, depending on transportation conditions. Although there is no evidence of a general reduction in price, favored purchasers and distributors can secure conduit at prices slightly shading the market from manufacturers whose stocks are accumulating.

PANELBOARDS AND CABINETS.—Manufacturers and jobbers report that business in this line is excellent. The government demand in the Southeast for this class of goods has been very heavy, which has tended to slow up deliveries somewhat.

SWITCHBOARDS.—Business in the smaller distribution type shows a marked improvement. Prices are steady, but deliveries are slowing up.

ARMORED CABLE.—The demand has lessened lately owing to a temporary decrease in apartment-house construction and old-house wiring. Local stocks are in good shape.

SEATTLE

The second week of the month finds wholesalers and retailers enjoying a continuation of satisfactory volume in practically all lines. The outstanding feature of the week's business was an increasing sale of sewing machines. The largest jobber in Seattle reports machines are going like wildfire with no evidence of a let-up, and the demand is being met. Other appliances, with the exception of ranges, are moving very satisfactorily. Range sales are expected to increase materially within the next thirty days. Sales to shipyards and industrial plants are much heavier than in the past three weeks, and transactions with lumber and logging companies are showing renewed activity. Jobbers in the large Northwest cities report many inquiries for motors and electrical equipment for numerous proposed bulk grain elevators for eastern Washington and for Oregon.

The contract for 500,000 incandescent lamps for the Seattle lighting department was awarded to a Seattle firm. The residence building boom in Seattle and Tacoma is continuing unabated. Portland's housing problem has been taken up, and immediate steps are projected to remedy the situation. Lumber production for the week was approximately 21 per cent below normal. Production was 14 per cent above orders and 5 per cent below shipments. Northwest lumbermen assure the government that the maximum output of spruce for airplanes will be reached, starting March 1. The required minimum will be exceeded two or three times. Rural trade in the Middle West promises to be the chief source of private lumber orders this spring, according to present indications. The reported basic eight-hour day is highly objectionable to Northwest lumbermen, and is not to be imposed upon the industry, provided that lumbermen can produce sufficient spruce and fir for government needs in airplane and ship construction.

The immediate appointment by the United States Shipping Board of a district purchasing agent, with headquarters in Seattle, is foreshadowed.

Local jobbing houses report that the freight situation is more distressing than ever, if possible. The free time for intercity switching is cut from forty-eight to twenty-four hours, causing additional grief. Oregon jobbers report the situation considerably improved, although shipments are slow.

Camp Lewis army officials announce the immediate erection of a five-hundred-thousand-dollar hotel. The concession is let to Tacoma capitalists. Lamps are steadily increasing in demand from shipyards, mills and industrials and to care for new residences and remodeling of dwellings.

Floodlamp sales are decreasing perceptibly. In flashlamps the demand is sustained.

While jobbers are contending with shortages and slow, irregular deliveries, they are meeting the demand better than could be expected. Conduit jobbers are experiencing difficulties in meeting heavy demands, with stocks in very poor condition. Slow deliveries and increasing demand are causing justifiable uneasiness. During the week the government buying was lighter, although sales to the yards and industrials increased.

The electric heater movement at present is very light. If the present favorable weather prevails, sales will be negligible. Dealers report that the season's sales set a record and were very satisfactory. Dealers' stocks of house-furnishing material are going rapidly and jobbers are feeling the impetus on account of increasing residence building, particularly in Seattle and Tacoma. This applies to sales of chandeliers, sockets, switches and glassware. Collections are easy. New applications for credit are scarce. Ample financed concerns encounter little difficulty in obtaining credit. Jobbers refuse absolutely to take chances and finance prospects.

SAN FRANCISCO

A rainfall that was general all along the Pacific Coast has brought invaluable relief to California farmers. If this is followed up by heavy rains in late February and March, business conditions will improve very materially. The precipitation in the mountains, however, has not been enough to relieve the shortage of stored water for power purposes and hydroelectric companies are still facing a most serious situation.

The wide separation between California and Eastern centers, both as to distance and conditions under which business is carried on, is emphasized by the fact that the "heatless Monday" order, which is not effective in California, is not even felt there as a reflex action from Eastern shutdowns. The one notable effect is the co-operation of power companies in combining transmission systems to save fuel.

The action at Washington in discouraging building will have little effect in San Francisco, since actual building in the month of January was only about 30 per cent of the normal volume. On the other hand, a very material improvement in building conditions has been indicated by the large number of recent inquiries at the Bureau of Buildings, and the possibility of interfering with that has brought out adverse comment on the Washington view.

An aviation camp is to be built at Riverside, Cal., it is announced, which will call for some large orders for electrical supplies. Government construction at other points is also active, and the volume of trade in government work, already very large, is still increasing. Shipbuilding activity is steadily increasing. The latest announcement in this line is that contracts for several more concrete steamers have been awarded. The first of this type is to be launched in a few weeks at San Francisco. Several I. W. W. plots have been prevented in the last week, and aside from the activities of that organization, which are now being effectively checked, labor conditions are in better shape than they have been for some time.

INTERPHONES.—A falling off of apartment-house construction and the tendency to classify interphones among the non-essentials in many buildings have kept this line inactive. There was no accumulation of business in the line during the time the production of interphones was practically discontinued because of the rush of government business.

ELECTRIC RANGES.—The lack of stored water this year, the price of fuel and conditions generally, which have caused sweeping reductions in the sales forces of various California companies, indicate that this will be a poor season for electric ranges of the household type. However, the same fuel and economy problems which hold back this line give impetus to the hotel-type ranges, and that line is very active, with bright prospects. Further announcement of the plans of the new consolidation of range manufacturers is awaited with much interest.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Medium-Base, Brass-Covered Receptacle

A medium-base, brass-covered receptacle is being offered to the trade by Pass & Seymour, Inc., of Solvay, N. Y., this receptacle to be known as P. & S. 60,020. Its shell or cover is in one piece and is made especially rigid by an addi-

PORCELAIN FOUNDATION CAST IN ONE
PIECE

tional bead which is spun on the skirt of the cover.

The shell proper of this device is threaded to receive the standard types of the "Uno" shade holder. The brass shell or cover is anchored to the porcelain interior by means of twin screws, and these in turn are held in place by means of special washers. The porcelain foundation for the interior is cast in one piece, and on this the keyless interior is mounted—providing the freedom of accessibility and wiring room so much desired by the practical wireman.

The supporting screw holes for this device are spaced 1½ in. and 2 in. (4.1 cm. and 5.08 cm.) on center. The holes for introducing the wires from the back of this receptacle are of ample size to accommodate heavy wires, and the terminal screws will be found of sufficient size and strength to grip and hold the wires. The lamp-screw shell is of special copper alloy and is secured to the porcelain base by a heavy horseshoe reinforcement.

Master Switch

The Igran Electric Company, Ltd., of London, Eng., has developed the mas-

BUTTON FOR STARTING AND LEVER FOR
STOPPING

ter switch shown herewith. This switch has a countersunk push-button at the side for starting and a lever at the front for stopping. This type is much favored by those who

consider that it is more safe to have starting and stopping devices of dissimilar shape than to have buttons which are distinguishable from each other only by the marking.

Series Type A.-C. to D.-C. "Compensarc"

The General Electric Company, Schenectady, N. Y., has recently developed an a.-c. to d.-c. "Compensarc" equipment which permits series operation of two arc-type projection lamps while projection is being changed from one lamp to the other. This "Compensarc" is known as the series type. It is made in capacities of 35, 50 and 70 amp. for all standard alternating-current circuits and can be used in nearly all installations.

Series operation was desirable to simplify wiring and to save energy by eliminating the steadying resistance in series with each arc lamp that was found necessary with previous methods

PERMITS SERIES OPERATION OF TWO
PROJECTION MACHINES

where lamps were connected in parallel across the generator armature. Complete equipment includes the "Compensarc," a steel cabinet control panel and a short-circuiting switch for each projection lamp. The 50-amp. and 70-amp. outfits have in addition a starting compensator. The control panel has an ammeter and a generator field rheostat, which are inclosed in the cabinet. The handle of the field rheostat comes through the panel just beneath the ammeter where it is convenient to regulate the arc-lamp current.

The ammeter, the field rheostat and all the wiring are mounted on the front wall of the cabinet, which is removable for mounting and for attention. Wiring may be either at the top or the bottom, as knock-outs are provided. Simple control is attained through the elimination of steadying resistance, use of few parts and compact arrangement.

Time Switch

The Hartford Time Switch Company, 71-73 Murray Street, New York City, is bringing out a new type of time switch in order to meet the government requirements of lightless nights. This switch is so designed that after the present emergency has passed it can be readily changed over and become a switch operating each day. These switches are made in sizes ranging from 10 amp. to 200 amp. They are single, double and triple pole and are declared to be dust-proof and weather-proof.

Electric Air Heaters

The Cutler-Hammer Manufacturing Company of Milwaukee has developed and is now marketing a line of electric air heaters designed to supplement the furnace or steam-heating system in the home, office, store, factory or large industrial plant. These electric air heaters are found useful in heating crane cabs, outhouses, valve, pump and meter houses, exposed remote corners or rooms, watch or signal towers, for shearmen and tablemen in steel plants, in theater ticket booths, as well as for scores of miscellaneous applications, and in such uses they effect a distinct saving in coal. Flexible electrical conductors will carry heat cheaply and efficiently to the most inaccessible points.

These air heaters are self-contained, easily moved from one point to another and possess the inherent advantages of all electrical heating devices—heat under perfect control and absolute freedom from dust, ashes, soot, unpleasant odors and vitiation of the air. The perfect control possible allows efficient use of the heat. As soon as a location is warmed, a turn of the switch cuts

GRID AND UNIT TYPE HEATER

off the current and the heater can be moved to warm another part.

C-H heaters are made in various shapes, sizes and capacities, and a heater to fit almost any space or condition of mounting may be selected.

Automatic Air-Pressure Outfit

The M. L. Bastian Auto Engineering Works, Olney, Philadelphia, has developed the outfit shown herewith, for service in garages and other places

FOR USE IN GARAGES

where air is required. The outfit contains a pump, motor, storage tank, pressure gage and the necessary air and electrical connectors.

The pump is gear-connected to a $\frac{1}{2}$ -hp. Robbins & Myers motor which is equipped with a cord and plug for connection to a lamp socket. A rawhide pinion is provided on the motor shaft to eliminate unnecessary gear noise.

Floor-Polishing Machine

The Dale-Rey Corporation of 25 Church Street, New York City, has developed the polishing machine for waxed floors, of wood or linoleum, shown in the accompanying illustration. It is pointed out that this machine is easy to operate; a boy or woman can easily handle it and quickly obtain a uniform result. The outfit weighs approximately 100 lb. (45.4 kg.). Its height over the case is $9\frac{1}{2}$ in. (24.1 cm.), and the width is 19 in. (48.3 cm.). It is mounted upon rollers, and moves around with little effort. It will go under desks—an important feature, it is pointed out.

CAN ALSO BE USED FOR SCRUBBING FLOORS

The essential apparatus consists of a cylindrical brush, propelled by a $\frac{1}{4}$ -hp. motor. The brush revolves at high speed, and not in the same plane as the floor, but at right angles thereto. This buffing action produces a hard surface

—resulting in a reduction in the amount of wax required.

The brush is made up of two semi-circular aluminum cylinders, mounted upon an aluminum drum, running upon Hess-Bright ball bearings, and is propelled from the motor by a chain and sprocket. A counterbalanced weight upon the handle of the machine may be adjusted so as to alter the pressure upon the floor.

Four-in-One Cartridge Fuse

A four-in-one cartridge fuse, known as the Atlas fuse, has been placed on the market by the Atlas Selling Agency of New York City. A sectional view A and an exploded view B of this fuse are given in the accompanying figure.

From the outside this type of fuse looks the same as the standard type of cartridge fuse, and it can be used anywhere that standard fuses are used. However, instead of one single chamber, as in the ordinary type of cartridge fuse, the inside of the shell is divided into four compartments by four pieces of fiber, then bent and assembled, as shown at C in both views. The fiber compartments fit into grooves D in the fiber-containing shell, making a strong construction.

SECTIONAL AND EXPLODED VIEW OF FUSE

One end of the fuse shell is equipped with a stationary brass cap E. From the center of this stationary cap is a copper extension F, from which four fuse wires G run through the four separate compartments to four copper terminals H, held in a short shell fiber cylinder I at the opposite end of the fuse. A stationary brass ferrule J is placed on the end of the fuse shell containing the four fiber terminals H and fiber cylinder I. Fitted over the stationary ferrule is a movable brass cap K containing a copper receptacle L that fits over one of the copper fuse terminals H, as shown in the sectional view. This completes the circuit through the fuse from the movable cap K to the stationary cap E. The copper terminals H are slotted in the end that the receptacles fit over, to give them a spring and make a good contact in the receptacle.

If a fuse blows, all that is necessary is to remove the cartridge from the clips, pull cap K out about $\frac{1}{4}$ in. (6.4 mm.), and give it a quarter turn, push back the cap, and another fuse element is in circuit. Replace the cartridge in the clips, and the circuit is again ready for service. To prevent making contact with any fuse element other than the one that is intended to be in circuit, a fiber washer M is placed in the top of the movable cap K. The blowing of a fuse element is indicated, as in a standard fuse, by a fine steel wire N that extends from the copper terminal H to the stationary cap E. Each fuse element is solidly packed in its chamber with an insulating powder. This new type of fuse is approved by the Underwriters' Laboratories, and is made with ferrule contact in all amperages up to and including 60. All measurements and dimensions are N. E. C. standard, thus assuring perfect fit in every type of N. E. C. standard panel, switchboard and inclosed-fuse cutoff.

Sign and Outlet Receptacle

Pass & Seymour, Inc., of Solvay, N. Y., are about to place on the market a receptacle that will be known to the trade as their No. 437. This device is of the screw-ring type which fits the common $1\frac{1}{2}$ -in. (3.8-cm.) hole. Its principal advantage lies in the fact that the body of the receptacle proper is but $\frac{13}{16}$ in. (2.06 cm.) in depth. This allows the wires to be carried the proper distance from the surface wired over and effects a material economy of space because it does not extend back far from the face of the sign, and when used in outlet boxes it does not extend from the outlet-box cover as far in the box as the common receptacle.

Provision is made in the back for pouring weatherproofing compound, thereby entirely covering the metal parts. It is also pointed out by the manufacturer that the receiving shell for the lamp is very rich in copper and yet has sufficient alloy to render it a dependable and rigid member. This lamp shell is retained in the receptacle by means of phosphor-bronze screws of special strength, which readily permit the removal of the receiving shell for the lamp without disturbing the terminal plates in the back of the receptacle.

A ball-tipped spring-center contact of phosphor bronze guarantees continuous contact with the base of the lamp. This is an important item because the usual

METAL PARTS ARE ENTIRELY COVERED

location of these receptacles, when installed, is remote and hard to get at. Any feature which adds to the durability and permanency of the device, it is pointed out, makes frequent attention unnecessary.

Trade Notes

THE GILPIN V. C. COMPANY, formerly of 2010 Broadway, has removed its offices to the warehouse at 50 Columbia Heights, Brooklyn, N. Y.

J. W. TAMM has been transferred to the New York City office of the Western Electric Company. He was formerly manager of the San Francisco branch of that company.

LYMAN C. REED, 821 Union Street, New Orleans, La., has been appointed district sales agent for the alternating-current motors and fans of the Century Electric Company, St. Louis.

C. M. SCOTT, formerly Cleveland representative of the Detroit Fuse & Manufacturing Company, is now associated with the Western Electric Company and will continue to make Cleveland his headquarters.

THE ALAN ELECTRIC COMPANY, recently incorporated in Jersey City, N. J., has acquired property at Montgomery Street and Baldwin Avenue, about 95 ft. by 100 ft., for the manufacture of electric generating machinery.

LEO H. GAMP, formerly manager of the F. E. Newbery Electric Company, announces that he has organized the Gump Electric Company, with offices at 1625-26 Chemical Building, St. Louis, Mo., for the purpose of doing a general electrical construction business.

E. I. WILLIAMS, recently with the Canadian General Electric Company, has been engaged by the Estate Stove Company of Hamilton, Ohio, as a representative of its electrical department. Mr. Williams has been identified with the electric heating industry for many years.

FRED WILMARTH of Rockford, Ill., has been selected to represent the Greusel-Quantof Electric Company of Milwaukee, Wis., in northern Illinois and southern Wisconsin. Mr. Wilmarth has just completed a long service with the firm of E. F. Pendergast & Company of Rockford.

THE COOPER HEWITT ELECTRIC COMPANY of Hoboken, N. J., announces that its Cincinnati office has been moved into larger quarters at No. 1406 First National Bank Building. George W. Walker, who has been with the company for the last ten years, continues as district sales manager.

THE INDEPENDENT LAMP & WIRE COMPANY has transferred its automobile and miniature lamp business to the Miniature Incandescent Lamp Corporation of Newark, N. J., where the production will be increased to approximately 30,000 lamps per day, enabling the company to take care of the greatly increased demand for its products.

JAMES B. OLSON has resigned as assistant secretary and general sales manager of the Habirshaw Electric Cable Company, Inc., of New York City. Mr. Olson expects to continue in the insulated wire and cable business, resuming business relations in the near future. In the meantime his address will be Hotel Chatelaine, Bedford Avenue, Brooklyn, N. Y.

THE GROSSMAN MANUFACTURING CORPORATION, Brooklyn, N. Y., announces that while the government has taken over the Bush Terminal property in Brooklyn, this will not affect its business. The government has only requisitioned the Bush docks and warehouse buildings, which does not in any way affect the industrial building in which the Grossman company is established.

H. W. WISWELL, recently manager of the apparatus department of the Brown & Hall Supply Company, St. Louis, and formerly with the St. Louis sales office of the Westinghouse Electric & Manufacturing Company for about ten years, has gone into business, under the style of H. W. Wiswell Company, as manufacturers' sales specialist, handling motors, generators, transformers, meters, electrical equipment and supplies.

ROBERT S. PARRETT of Alexandria, Va., has been appointed commercial attaché to the American embassy at Buenos Aires, Argentina, according to an announcement made Feb. 7 by the Bureau of Foreign and Domestic Commerce, Department of Commerce. He will also act as the War Trade Board's representative in Argentina. The commercial attachés are "business diplomats" stationed permanently at the principal foreign capitals. Their work is particularly important at this time, when careful attention must be given to present abnormal conditions and plans laid for maintaining the position of the United States after the war.

JOHN F. GILCHRIST has been elected president of the Federal Sign System (Electric), succeeding John H. Goehst, who died on Jan. 1, 1918. Mr. Gilchrist was one of the organizers of the Federal Electric Company, predecessor of the Federal Sign System (Electric), and served as treasurer for a number of years. Mr. Gilchrist is also vice-president of the Commonwealth Edison Company, vice-president of the Middle West Utilities Company, and assistant to the president of the Public Service Company of Northern Illinois. James M. Gilchrist has been elected secretary and treasurer of the Federal Sign System (Electric), succeeding as treasurer John F. Gilchrist, and Ralph T. Schuetz has been elected a director to succeed Mr. Goehst.

THE HURLEY MACHINE COMPANY of Chicago is offering for investment \$500,000 of 7 per cent cumulative preferred stock, par value \$100 per share. It is redeemable at \$110 and accrued dividends, carrying with it 15 per cent in common stock. The Hurley company manufactures a large line of electrical labor-saving devices for the home, under the trade name "Thor." Through this new capital the company will be provided with facilities to increase its output from 400 to 600 per cent over its 1917 sales, which totaled about \$1,650,000. The new plant of the company, which it purchased early in the year, at Twenty-second Street and Fifty-fourth Avenue (Cicero), just outside the city limits, is 256 ft. by 636 ft., the buildings containing 65,000 sq. ft. of floor space.

THE BUREAU OF FOREIGN AND DOMESTIC COMMERCE, Department of Commerce, Washington, D. C., in a report made public lately, points out America's opportunity of increasing its sales of electrical goods in Ecuador and Peru during the absence of German competition. Before the war this trade was divided between Germany and the United States, the advantage being with the American manufacturer. The government's report is concerned with the market as it exists to-day and the opportunities it offers for the future. Copies of "Electrical Goods in Ecuador and Peru," Special Agents' Series No. 154, can be purchased, at the nominal price of 10 cents, from the Superintendent of Documents, Government Printing Office, Washington, D. C., or from any of the district or co-operative offices of the Bureau of Foreign and Domestic Commerce.

EXPORT LICENSES.—The War Trade Board has announced that all export licenses issued on and after Jan. 22, 1918, shall be valid for a period of ninety days except in the case of special commodities where a different period is specifically prescribed or allowed. Heretofore the term of an ordinary export license has been sixty days from the date of issuance, and the new ruling has been adopted in order to aid manufacturers who contract for future delivery and to avoid congestion at ports of exit due to the expiration of export licenses pending shipment and the delay involved in obtaining new licenses or extensions of the originals. No extensions whatsoever of the new "ninety-day" licenses will be granted. If it becomes evident that goods cannot be shipped during the term of the license, a new application for license should be filed in ample time stating the probable date of shipment. In such cases the original license should not be returned with the new application but should be held until it has expired. Extensions of licenses issued on or before Jan. 21, 1918, will be granted as heretofore. It is announced that the Bureau of Exports has discretion to grant licenses valid for a period not exceeding six months in cases where the article to be exported must be specially manufactured and there is satisfactory evidence that more than ninety days are required for its manufacture and shipment. No extensions whatsoever of these licenses will be granted, and in case of expiration before shipment a new license must be applied for.

Trade Publications

FANS.—The Eck Dynamo & Motor Company of Belleville, N. J., has prepared a leaflet descriptive of its Eck hurricane fans.

PIPE BENDER.—The Martin portable vise stand and pipe bender is illustrated and described in a leaflet prepared by H. P. Martin & Sons, Owensboro, Ky.

SYNCHRONOUS MOTORS.—Bulletin No. 182, descriptive of synchronous motors, has been prepared by the Electric Machinery Company of Minneapolis, Minn.

PIPE VISE.—The Gerold Manufacturing Company of Old Colony Building, Chicago, is distributing a leaflet descriptive of its Chaining pipe vise.

AMMONIA CONDENSERS.—The De La Vergne Machine Company of New York City has prepared a folder descriptive of its counter-current ammonia condensers.

FANS.—The Racine Electric Company of Racine, Wis., is distributing a leaflet descriptive of its 12-in. desk and wall fan, its 8-in. desk and wall fan and its table fan.

LIGHTING FIXTURES.—The Luminous Unit Company of St. Louis, Mo., is distributing its catalog No. 6, descriptive of its "Brascolite," "Aglite," "Projectolite" and "Industrolite" units.

STREET-LIGHTING FIXTURES.—Type CL Luxeolite fixtures are illustrated and described in catalog 7-A, supplement 3, issued by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa.

PROJECTOR DEVICES.—The Argus Lamp & Appliance Company, 322 Euclid Avenue, Cleveland, Ohio, is distributing a booklet of sales information and prices, in effect Feb. 1, 1918, covering Argus units, consisting of the Sheek universal adapter and Argus current regulators, for operating all types of Mazda projector lamps for motion-picture projection.

STOKER EQUIPMENT.—The Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., is distributing a folder containing leaflets on its stoker equipment. The subjects taken up in these leaflets are cost of steam, the Westinghouse Roney stoker applied to tubular boilers, air distribution of underfeed stokers, efficiency and capacity of underfeed stokers and the construction of underfeed stokers.

ILLUMINATION.—In a bulletin entitled "Fundamentals of Illumination Design" the engineering department of the National Lamp Works of General Electric Company has presented in simple and readable language a discussion of the broad principles which underlie illuminating engineering practice. The bulletin should prove of exceptional value to schools and colleges, particularly to those in which a course in illumination is included as a part of the regular study program. Its value is not limited to students, however, for much of the material presented is the result of very recent investigations and the data will bear the closest scrutiny of the practicing illuminating engineer. This bulletin on the fundamentals, the bulletins on specific applications, such as industrial lighting, store lighting, show-window lighting, light projection, tennis-court lighting, protective lighting, etc., together with the bulletins on Mazda lamps, comprise an accurate, practical and up-to-the-minute reference work on illumination.

New Incorporations

THE OSBORNE STORAGE BATTERY COMPANY of Cleveland, Ohio, has been chartered with a capital stock of \$10,000 by Carroll K. Osborne and Earl H. Jaynes.

THE SPENMAN ELECTRIC VALVE GRINDING COMPANY of Worcester, Mass., has been incorporated with a capital stock of \$50,000 by B. T. Spenman, A. W. Larson and J. N. Sandberg, all of Worcester.

THE TECHNICAL PRODUCTION COMPANY of New York, N. Y., has been incorporated by G. H. Hyman, J. Lampel and H. Lampel, 580 Fifth Avenue, New York, N. Y. The company is capitalized at \$25,000 and proposes to manufacture electrical supplies.

THE STORAGE BATTERY DISTRIBUTING COMPANY, 678 Montgomery Street, Jersey City, N. J., has been incorporated by Frederick S. Moore, 258 Springfield Avenue, Newark, N. J.; Howard C. Chase, 2560 Boulevard, Jersey City, and John H. Bauer, 48 Bergen Avenue, Jersey City. The company is capitalized at \$6,500 and proposes to equip and deal in electrically-propelled and other vehicles.

THE PAGE WIRE FENCE COMPANY OF CANADA, of Walkerville, Ont., has been incorporated with a capital stock of \$250,000 to manufacture iron, steel, metals, hot and cold ingots, billets, rods, bars, wire, cable, etc. Arrangements are being made by the company to erect a plant at Three Rivers, Que., to cost about \$150,000. The incorporators are: Arthur R. W. Plimssoll, Reigner Brodeur, Adolphe Chouinard and others of Montreal, Que.

THE ALMA (MICH.) ELECTRIC & BATTERY COMPANY has been incorporated with a capital stock of \$20,000.

THE MAJESTIC ELECTRIC SUPPLIES, Ltd., of Toronto, Ont., Can., has been chartered with a capital stock of \$150,000 by Jacob H. Greenberg, 24 King Street West, Toronto, and others.

THE McDANIEL ELECTRIC COMPANY of Mansfield, Ohio, has been incorporated with a capital stock of \$10,000 by William McDaniels, Roy J. McDaniel, F. Frank, E. McDaniel and William F. Gill.

THE UNITED STATES MAGNETO COMPANY of New York, N. Y., has been incorporated with a capital stock of \$10,000 by C. R. Allison, J. J. McGrath and A. L. Story, 128 Broadway, New York, N. Y.

THE MARVIS MACHINERY COMPANY of New York, N. Y., has been chartered by Arthur P. Davis, David M. Mahood and John H. Noll. The company is capitalized at \$10,000 and proposes to do electrical work.

THE APPEL BATTERY SERVICE COMPANY of St. Louis, Mo., has been chartered with a capital stock of \$6,000 by Victor R. Appel, Robert G. McCurdy and Harry W. Pohle. The company proposes to deal in auto storage batteries.

THE AKRON (OHIO) ELECTRIC REGULATOR COMPANY has been incorporated with a capital stock of \$100,000 by William

H. K. Stephens, H. K. Raymond, William F. Pfeiffer, C. W. McLaughlin, W. Franklin Clark and John W. Thomas.

THE NEW YORK ELECTRICAL LABORATORIES of New York, N. Y., have filed articles of incorporation with a capital stock of \$10,000. The incorporators are: F. C. Hoops, T. B. Hazleton and S. Morgan, 47 West 125th Street, New York, N. Y.

THE CHINA ELECTRIC COMPANY of Dover, Del., has filed articles of incorporation with a capital stock of \$1,000,000 to construct and operate electric plants. The incorporators are: W. F. O'Keefe, G. G. Speighler and E. E. Wright of Wilmington, Del.

ALBERT F. GANZ of New York, N. Y., has filed articles of incorporation with a capital stock of \$12,000 to manufacture apparatus for the mitigation of electrolysis, etc. The incorporators are: E. L. Hegeman, R. J. Jacobus and F. L. R. Francisco, 511 Fifth Avenue, New York, N. Y.

THE ELECTRIC COMPANY of Hartford, Conn., has been incorporated by George H. Cooper, J. G. Peterson, both of Hartford, and Theodore Birath of Jersey City, N. J. The company is capitalized at \$50,000 and proposes to manufacture and deal in electrical devices, etc. The company will begin business with \$3,500.

THE SCHROEDER HEADLIGHT & GENERATOR COMPANY of Evansville, Ind., has been chartered with a capital

stock of \$150,000 by William H. McCurdy, John D. Craft, William A. Carson, Albert F. Karges, Marcus S. Sonntag, J. H. Schroeder and S. W. Cook. The company proposes to manufacture and deal in headlights.

THE ELECTRIC WELDING & MANUFACTURING COMPANY of Milwaukee, Wis., has been chartered with a capital stock of \$10,000 by George F. Luehring, Joseph Stika and Oscar Greulich. The company proposes to operate a machine shop and specialize in repairs by the oxy-acetylene process, as well as manufacture seamless goods.

THE EQUITABLE MACHINERY CORPORATION of New York, N. Y., has been incorporated by C. E. McManus, 400 West 160th Street; T. F. Hussa, 50 Church Street, New York, N. Y., and C. W. Hussa of Montclair, N. J. The company is capitalized at \$25,000 and proposes to manufacture engines, electric supplies and mechanical apparatus.

THE ARMA ENGINEERING COMPANY of New York, N. Y., has been chartered with a capital stock of \$50,000 by A. P. Davis, 542 West 112th Street; P. C. Verner, 202 Riverside Drive, New York City, and D. M. Mahood, 4821 Fort Hamilton Parkway, Brooklyn, N. Y. The company proposes to do a general electrical and mechanical engineering and general contracting business, etc.

New England States

BOOTHBAY HARBOR, ME.—The property and holdings of the Boothbay Harbor Electric Light & Power Company have been taken over by the Lincoln County Power Company, which plans to enlarge the plant. Contracts for the construction of a new power station at Boothbay Harbor have been awarded and work is being pushed on the new 11,000-volt transmission line now being erected to connect Damariscotta, Bristol and Boothbay Harbor.

LYNN, MASS.—The Lynn Gas & Electric Company contemplates the installation of a 7500-kw. turbine. Orders have been placed for the machine to be delivered in June. J. F. Dubois is manager of the electric department.

NEW BEDFORD, MASS.—The Board of Gas and Electric Light Commissioners has granted the New Bedford Gas & Electric Company permission to issue 4770 shares of capital stock at \$150 a share (par value \$100) and also to issue \$885,000 in bonds, the proceeds to be used to take up outstanding indebtedness and to pay for the cost of the new Cannon Street station now under construction.

PLYMOUTH, MASS.—The Plymouth Electric Light Company has petitioned the Selectmen of Kingston for permission to erect poles on Brookdale Avenue from the Duxbury town line to Brackett's Mill for the purpose of operating a three-phase, 11,000-volt transmission line.

WORCESTER, MASS.—The City Council is considering the installation of additional street lamps on Fairmont Avenue and on Plantation Street from the Boston and Albany railroad bridge to Franklin Street.

NORWICH, CONN.—Contracts have been signed by the Water and Light Commissioners for one 4000-kw. General Electric turbine, two Babcock & Wilcox boilers (510 hp.), C. H. Wheeler condensing apparatus, two sets of type "E" stokers and forced and induced draft apparatus for the municipal electric-light plant. A new building will be erected for the boilers. S. J. Kehoe is manager of the municipal gas and electric plant.

Middle Atlantic States

ALBANY, N. Y.—A portion of the plant of the Esco Electric Company of Albany was destroyed by fire on Jan. 30, causing a loss of about \$75,000.

ALBANY, N. Y.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until Feb. 27 for conduit and wiring, gas piping and lighting fixtures in the United States custom house and post office at Albany. Specifications may be obtained at the above office or at the office of the custodian at Albany.

BINGHAMTON, N. Y.—Bids will be received by the State Hospital Commission, Capitol, Albany, N. Y., until March 6 for renewals of electric wiring, main building. Binghamton State Hospital, Binghamton. For details see Searchlight Department.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

BUFFALO, N. Y.—The Niagara, Lockport & Ontario Power Company of Buffalo, which recently took over the Salmon River Power Company, has been authorized by the Public Service Commission to issue \$1,300,000 in notes, the proceeds to be used for extensions and improvements and to take up outstanding obligations. The company has begun work on the installation of a 15,000-hp. steam-driven electric generating unit at its Lyons plant.

HUDSON, N. Y.—Work has begun on the new electric power cable to be erected across the river, just below Hudson.

LYONS, N. Y.—The output of the steam electric generating plant of the Niagara, Lockport & Ontario Power Company in Lyons is being increased from 25,000 hp. to 40,000 hp. It is expected to have the new unit installed by June 1, 1918.

OGDENSBURG, N. Y.—The City Council is considering entering into an agreement with the Ogdensburg Power & Light Company to furnish electricity to operate the pumping station. Tentative terms are being considered by the Council for renewing the contract for street-lighting which expires some time next year. Mayor Frank is said to be in favor of extending the cluster-lamp lighting system from Ford Street to the New York Central depot.

SCHENECTADY, N. Y.—A certificate of extension of service has been filed in the office of the county clerk by the Schenectady Illuminating Company, which provides for supplying electricity for lamps and motors and also manufacturing and dealing in all kinds of electrical appliances and apparatus in towns in Schenectady, Albany, Fulton Herkimer, Montgomery, Rensselaer, Schoharie, Saratoga and Washington counties.

UNION SPRINGS, N. Y.—The Union Springs Light & Power Company is erecting 12 miles of electric transmission lines to supply electrical service to the country between Auburn and Union Springs. Energy will be secured from the Niagara Power Company, through the Empire Gas & Electric Company (Auburn division). The line will be completed early in the spring of 1918. The local plant, it is expected, will be closed down when the line is finished. Transmission lines are also being erected to the towns of Plournoy, Mapleton and the summer resort at Farley's, N. Y. Douglas A. B. Smith is general manager.

NEWARK, N. J.—The Gamon Meter Company, 286 South Street, is contemplating the construction of a boiler plant and engine house at its works.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25 for furnishing under specifica-

tions No. 2809 one electric traveling crane at the navy yard, Philadelphia. The cost is estimated at \$25,000.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25 for furnishing an electrically-operated traveling crane, of the overhead type, installed on the runways in the addition to the boat shop at the navy yard, Philadelphia. Drawings and specifications (No. 2809) may be obtained on application to the above bureau or to the commandant of the navy yard named.

PHILADELPHIA, PA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25 for addition to boat shop, consisting of a new building, 100 ft. by 400 ft., and an extension of existing building, about 62 ft. by 116 ft., including lighting and heating systems, etc. Drawings and specifications (No. 2806) may be obtained on application to the bureau or to the commandant of the navy yard named.

PLYMOUTH, PA.—Plans, it is reported, are being considered by the American Gas Company for rebuilding the electric-light plant of the Luzerne County Gas & Electric Company of Plymouth, which it controls.

SINKING SPRING, PA.—Application will be made to the Public Service Commission by the Berkshire Electric Company of Sinking Spring for approval of a contract with the borough of Wernersville and the borough of Robesonia for street lighting.

BRIDGEVILLE, DEL.—The Eastern Shore Gas & Electric Company is erecting an electric transmission line from Bridgeville to Greenwood to supply electricity to the latter place. When the line is completed the plant at Greenwood will be closed down. The local plant will then supply energy in Laurel, Blades, Seaford, Bridgeville and Greenwood.

CHARLESTON, W. VA.—Extensions and improvements are under way by the West Virginia Water & Electric Company, which will greatly increase the output of both the electric and water plants. The company has recently closed a contract with the United States government to supply water and electricity for lamps and motors at the new government projectile plant now being erected in Charleston. W. C. Davisson is vice-president.

FAIRMONT, W. VA.—The board of directors of the Monongahela Valley Traction Company, it is reported, have approved an issue of \$3,000,000 in notes, the proceeds to be used for improvements. The proposed work includes a large power plant at Rivesville, already reported under construction.

WHEELING, W. VA.—The City Council is considering changing the street-lighting system from direct to alternating current. A consulting engineer has been engaged to make investigations relative to same. W. B. Kain is superintendent of the municipal electric-light plant.

WASHINGTON, D. C.—Bids will be received by the general supply committee, Treasury Department, Washington, D. C.,

until March 6 for furnishing as may be ordered from time to time during the fiscal year beginning July 1, 1918, and ending June 30, 1919, supplies as follows: Class 5—Laboratory apparatus and hospital appliances; and surgical instruments; Class 6—Electrical, engineering and plumbing supplies; Class 15—Incandescent electric lamps; Class 16—Incandescent gas lamp supplies; Class 17—Motor trucks; Class 18—Machines, office, labor-saving; addressing, computing, duplicating, folding, sealing and typewriting, supplies for addressing machines and typewriter equipment, etc., of the general schedule of supplies for use by the executive departments and other establishments of the government of the United States. Proposal blanks may be obtained on application to the general supply committee, Auditor's Building, Fourteenth and B Streets, S. W., Washington, D. C.

North Central States

DETROIT, MICH.—Bids will be received by the lighthouse inspector, Detroit, Mich., until Feb. 19, for furnishing an 18 to 24-hp. marine gasoline engine. Further information may be obtained at the above office.

FLINT, MICH.—The office building of the Michigan Light Company and the Consumers' Power Company was damaged by fire recently, causing a loss of about \$30,000.

FLINT, MICH.—Bids will be received by the Board of Water Commissioners of the city of Flint until March 5 for furnishing and installing one 15,000,000-gal. 150-ft. total head-gear turbine-driven centrifugal pumping unit with condenser and auxiliaries. F. N. Baldwin is superintendent.

MORENCI, MICH.—The Southern Michigan Light & Power Company is planning to extend its electric transmission line, three phase, 6600 volts, to Alverton, Ohio, and Waldron, Mich., work on which will start early this spring. The company will furnish energy to operate the Avis Milling Company at Waldron, which operates a flour mill and lighting plant. C. J. Avis is treasurer.

CLEVELAND, OHIO.—Bonds to the amount of \$350,000, it is reported, have been sold by the city of Cleveland, the proceeds to be used for improvements to the municipal electric-light plant.

DAYTON, OHIO.—Arrangements have been made whereby the Dayton Power & Light Company will furnish electricity to be used in the construction work by the Miami Conservancy District. The power will be used on the Germantown, Englewood, Taylorsville and Huffman dams and for river channel excavation in Dayton. The company will begin work at once on the erection of electric transmission lines to the various dam sites. At Dayton two large drag-line excavators, operated by electric motors, will be the principal power users. All motors to be used in the work have been purchased.

NORTONVILLE, KY.—The Norton Coal Mining Company is planning to build an addition to its power house, brick commissary house and supply house, for which bids have been received. B. Price, Empire Building, Birmingham, Ala., is architect.

BRAZIL, IND.—The Terre Haute, Indianapolis & Eastern Traction Company of Indianapolis has filed a petition with the Public Service Commission for authority to purchase the plant and holdings of the West Indiana Utilities Company of Brazil.

MARION, IND.—The capital stock of the Delta Electric Company has been increased from \$90,000 to \$115,000.

WHITING, IND.—Bids will be received by the Board of Public Works of Whiting, Ind., until Feb. 25 for construction of a sewage pumping system in accordance with plans and specifications now on file at the office of the Board of Public Works.

SALEM, ILL.—Work has begun on rebuilding the local machine shop and engine house of the Chicago & Eastern Railroad Company, recently destroyed by fire. The cost of the new buildings is estimated at about \$300,000.

APPLETON, WIS.—The Patton Paper Company, it is reported, is considering the construction of a hydroelectric power plant.

BAYFIELD, WIS.—Preparations are being made by the Booth Fisheries Company of Chicago, Ill., to build a new cold-storage warehouse and refrigerating plant at Bayfield to replace the group of buildings destroyed by fire on Jan. 13, causing a loss of about \$50,000.

BLOOMER, WIS.—The transmission line of the Wisconsin-Minnesota Light & Power Company, which supplies energy to the Bloomer Electric Light & Power Company, is being changed from 6600 to 13,200 volts to be delivered at the substation at

Bloomer. Three-phase, 220-volt motor circuits will be available upon completion of the line about March 15. The plant may possibly be taken over by the municipality, which is now considering establishing a municipal electric-light and power plant. F. E. Walrath is secretary and manager.

LA FARGE, WIS.—The La Farge Electric Company will install a 125-hp. Corliss engine this year. Machinery has already been purchased.

OWEN, WIS.—The J. S. Owen Lumber Company has been granted a franchise to supply electricity in Withee. The company has taken over the municipal electric plant and will soon supply energy from its local plant to operate the Withee system. A. R. Owen is president.

WITHEE, WIS.—Electricity for operating the local system will be furnished from the plant of the J. S. Owen Lumber Company of Owen, which has been granted a franchise in Withee and taken over the municipal electric plant.

CROOKSTON, MINN.—At an election to be held Feb. 20 the proposal to issue \$535,000 in bonds for the purchase of the property of the Crookston Water Works, Power & Light Company will be submitted to the voters.

ELY, MINN.—The Hines Lumber Company, it is reported, contemplates developing the water power at the Kawishiwi Falls to furnish power for mines and other local industries.

LANESBORO, MINN.—Plans have been prepared by the Power Engineering Company, Corn Exchange, Minneapolis, for a municipal hydroelectric plant. The city will build superstructure for power house and, it is said, will call for bids on water wheel, generator and governor. The plant will be changed from direct to alternating-current system. A transformer and transmission supplies will be purchased.

VIRGINIA, MINN.—The contract for electrical work for the high school building has been awarded to the Sterling Electric Company, 33 South Fifth Street, Minneapolis, Minn., at \$38,906.

CEDAR FALLS, IOWA.—The city of Cedar Falls is planning to install a 150-hp. horizontal boiler in the water works pumping station.

GREENFIELD, IOWA.—The Council has adopted a resolution authorizing the construction of 6-in. water mains and the erection of a transmission line to supply electricity for pumping water.

SIGOURNEY, IOWA.—The Sigourney Electric Company has applied to the Board of Railroad Commissioners of Iowa for a franchise to construct and operate an electric transmission line on the roads and highways of Keokuk County for the distribution of electricity for lamps and motors.

FAIR PLAY, MO.—Steps have been taken to organize a stock company for the purpose of building a hydroelectric plant on Bear Creek to supply electricity in Fair Play and neighboring towns. The cost of the proposed plant is estimated at \$20,000. W. C. Elrod of the Fair Play Roller Mill Company and others are interested in the project.

BRADLEY, S. D.—The Dakota Northern Power Company of Bradley is contemplating erecting 15 miles of electric transmission line to connect its system with transmission systems of the Spink County Power Company, which it controls. The electric plant at Henry has been discontinued and is now being served by the transmission line of the Dakota Northern company. The power station at Raymond has also been closed down and is being served by the Spink County Power Company. E. H. Lewis is secretary and manager.

BROOKINGS, S. D.—Bids will be received by the Regents of Education of the State of South Dakota, addressed to the president of the State College of Agriculture and Mechanic Arts, Brookings, S. D., until Feb. 25 for the electric wiring of the armory building to be erected at the State College of Agriculture and Mechanic Arts, Brookings. F. H. Ellerbe of St. Paul, Minn., is architect.

LESTERVILLE, S. D.—The contract for construction of the proposed municipal electric-light plant has been awarded to Otto S. Oleson of Sioux Falls.

BROKEN BOW, NEB.—Preparations, it is reported, are being made to install a new 100-hp. Loomis engine in the local electric-light plant for the purpose of extending the commercial lighting service.

DUNBAR, NEB.—The new municipal electric-light plant has recently been completed and put into commission.

FALLS CITY, NEB.—At an election held recently the proposal to issue \$60,000 in bonds for extensions to the municipal elec-

tric-light plant and water-works system was carried.

JUNIATA, NEB.—The City Council is considering calling an election to submit to the voters the proposal to issue \$7,000 in bonds for the construction of an electric transmission line to Hastings.

DODGE CITY, KAN.—The Midland Water, Light & Ice Company has petitioned the City Council to submit a proposal to extend its franchise for a period of ten years to the voters. The company is asking for an extension of its franchise to enable it to make improvements in order to maintain electric transmission lines from Dodge City to neighboring towns in the Arkansas River Valley. The request for a 20-year franchise was defeated last fall.

KINGMAN, KAN.—The old millrace and power plant has been purchased by the Independent Milling Company of Kingman, which will utilize the power to generate electricity to operate its mill.

LEAVENWORTH, KAN.—Arrangements have been made by the Victor Manufacturing Company, manufacturer of electric washing machines, to erect a new building and double the output of its plant.

Southern States

JACKSON, GA.—Improvements are contemplated to the municipal electric-light plant, including rebuilding 1½ miles of pole line (2300 volts) and the installation of a high-pressure centrifugal pump, two stage, electrically driven. W. E. Merck is general manager of the water and light plant.

JEFFERSONVILLE, GA.—The Council is considering calling an election to vote on the proposal to issue \$15,000 in bonds for the installation of a municipal electric-light plant.

SHELLMAN, GA.—Another well is being installed to furnish water for the boiler in the municipal electric-light plant. E. C. Pemberton is superintendent.

WAUCHULA, FLA.—The Council will soon call an election to submit the proposal to issue \$42,000 in bonds to purchase or to build an electric-light plant and for other municipal improvements to the voters.

WHIDDEN, FLA.—The Kissimmee Cattle Company is reported to be considering the installation of an electric-light plant and ice factory. W. E. Ward of Kissimmee is manager. Whidden has not a post office.

BRISTOL, TENN.-VA.—The power dam which was nearing completion for the Rosedale Power Company, on the Holston River, near Bristol, was recently damaged by the flood.

CLINTON, TENN.—The local electric-light plant has been purchased by the Clinton Power Company. The new owners will improve the plant and extend the service. E. C. Cross is president.

COLLINWOOD, TENN.—Contract has been awarded by the Tennessee Valley Iron & Railroad Company to the Thompson-Starrett Company, 51 Wall Street, New York, N. Y., for the construction of a wood distillation plant. The cost of the entire plant is estimated at \$1,500,000. Various improvements including construction of dwellings, water supply, electric-lighting systems, sewers, etc., will cost about \$500,000. W. J. Summers of New York City will have charge of the construction work in Collinwood.

FRIENDSHIP, TENN.—The plant and equipment of the Friendship Electric Light & Power Company, it is reported, has been purchased by the Marvel Milling Company. A new generator has been purchased, it is understood, by the Marvel company which will be installed in the Main Street mill.

BIRMINGHAM, ALA.—Plans are under way for the construction of an interurban railway to be operated by electricity or other power from Birmingham to the Warrior River, a distance of about 21 miles. Two routes are under consideration, one of which would necessitate the building of only 16 miles of line, about 5 miles of existing railroad being utilized. The other plan is to construct an entirely independent line. A company to be known as the Alabama Interurban Railway Company, capitalized at \$5,000,000, will be incorporated to build and operate the proposed railway. G. R. Harsh is general counsel.

GURLEY, ALA.—The Alabama Power Company is erecting an electric transmission line from Huntsville to Gurley. When completed electricity to operate the local system will be supplied from the Huntsville plant.

MOUNTAIN HOME, ARK.—The Zinc & Iron Ore Company, recently organized, it is reported, proposes to construct a hydroelectric development on the North Fork River and build smelters.

LAVERNE, OKLA.—Arrangements are being made by the City Council for the installation of a municipal electric-light plant, for which \$13,000 in bonds were recently voted.

MIAMI, OKLA.—Preliminary steps will be taken at once by the City Commissioner to start work on extensions and improvements to the municipal electric-lighting system, involving an expenditure of about \$45,000.

WEWOKA, OKLA.—The installation of an electric-lighting plant is under consideration by the City Council.

BRYAN, TEX.—The City Commission has adopted an ordinance authorizing the city manager to purchase additional transformers for the light and power systems. The privilege of erecting an electric line beyond the city limits to connect with the city system has been granted by the City Commission.

DEL RIO, TEX.—The construction of a series of dams across Devil's River to provide for water storage for irrigating large areas of land is being promoted by Charles A. Lindsay of Wichita, Kan., and associates. It is also proposed to install one or more hydroelectric plants in connection with the irrigation project.

EAGLE PASS, TEX.—J. R. Sanford and associates are planning to install two centrifugal pumps of 75 hp. each, driven by electric motors, for the purpose of pumping water to irrigate 2000 acres of land about 7 miles from Eagle Pass.

SAN ANGELO, TEX.—The Interstate Electric Corporation is planning to extend its electric transmission lines to a number of towns in Western Texas in addition to those that are already being served. The line which now runs from San Angelo to Ballinger will be extended to Coleman and Brownwood.

Pacific and Mountain States

BREMERTON, WASH.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until March 4 for the erection of telephone and power transmission lines at the navy yard, Puget Sound. Drawings and specifications (No. 2805) may be obtained on application to the above bureau or to the commandant of the navy yard named.

TACOMA, WASH.—Surveys of four sites tributary to the Nisqually River are being made by Llewellyn Evans, superintendent of the city lighting plant, for an additional power plant to develop 17,000 hp. The cost is estimated at \$1,000,000.

BAKER, ORE.—The electric transmission line of the Idaho-Oregon Light & Power Company, extending from Homestead on the Snake River to Pine Valley, has been completed and is serving electricity for lamps and motors in the towns of Halfway, Carson, Langrell and Cornucopia. The company is also erecting a line into Eagle Valley to furnish electricity in the towns of Richland and New Bridge.

EUGENE, ORE.—Improvements to theume and forebay at the municipal electric generating plant at Waterville is under consideration by the Water Board. C. W. Geller is secretary and general superintendent.

GOLD HILL, ORE.—The placer mining property known as the Hydraulic Mining Company's mine has been purchased by W. A. Sharp of Grants Pass, and brother, L. S. Sharp. The new owners, it is said, will install hydro-electric precipitating value-recovering mining machinery.

McMINVILLE, ORE.—The installation of the new street-lighting system, consisting of 75 series incandescent lamps of 75 cp., is nearly completed. F. E. Thornton is superintendent.

SALEM, ORE.—Two applications have been filed with the state engineer for power developments on the Deschutes River by H. S. McGowan of McGowan, Wash., who is identified with P. J. McGowan & Sons, large salmon packers. One is for an appropriation of 4500 cu. ft. of water of the Deschutes River at a point known as the reclamation power site in Sherman and Wasco Counties. It is proposed to construct a dam 118 ft. high and 300 ft. long at the bottom and 800 ft. at the top, to cost approximately \$2,000,000. The other application is for an appropriation of 3500 cu. ft. per second of water of the Deschutes River at the Metolius power site in Jefferson County, where it is proposed to build a dam 236 ft. high, 90 ft. long at the bottom and 420 ft. long at the top. The cost is estimated at \$4,000,000.

ALPAUGH, CAL.—The new substation of the San Joaquin Light & Power Company,

which is to supply electricity to operate the pumps for irrigating 8000 acres in the Alpaugh Irrigation district, has been completed. The substation is equipped with three 500-kw. transformers and is supplied with electricity from the Corcoran generating station.

EL SEGUNDO, CAL.—The City Council has granted the Southern California Edison Company a franchise to erect electric transmission lines, conduits, cables, etc., for the distribution of electricity in El Segundo for a period of 40 years.

FRESNO, CAL.—The Board of Trustees has awarded the contract for installing 118 electroliters on Fresno Avenue from G to A and from A on Kearney Boulevard to Te-hama to the Lewis Electric Company of Fresno.

LOS ANGELES, CAL.—Plans are being prepared by the Pacific Electric Railway Company of Los Angeles for the construction of 14 new shop buildings, including machine shops and forge works at Torrance. The total cost is estimated at about \$1,000,000.

OLIVE, CAL.—Steps have been taken by the Olive Improvement Association for establishing the Olive lighting district.

RICHMOND, CAL.—The installation of an ornamental street-lighting system is under consideration by the Richmond Retail Merchants' Association.

SAN DIEGO, CAL.—A petition has been filed with the Board of Supervisors asking for the formation of a public highway lighting district, to be known as the Sierra Vista public highway.

WOODLAND, CAL.—The Pacific Gas & Electric Company contemplates extending its electric transmission lines to Guinda, Rumsey and Brooks.

YOSEMITE, CAL.—The Treasury Department at Washington has petitioned Congress for authority to use \$5,000 of the revenues of Yosemite National Park to complete the new hydroelectric power plant in the park.

KENDRICK, IDAHO.—The Potlach Consolidated Electric Company has placed orders for copper wire to replace the iron wire for the electric transmission line between Kendrick and Troy. The company is now installing three new transformers at its Troy station. A. Wilmot is president.

GOLD HILL, UTAH.—Frank W. Ferris of Gold Hill, it is reported, is building a power plant on Trout Creek, about 48 miles from Gold Hill, to cost between \$40,000 and \$50,000. Electricity generated at the plant will be used at the mines in the Gold Hill, Clifton, Willow Springs, Fish Springs, Ferber and other mining districts.

SALT LAKE CITY, UTAH.—Application has been made to the State Engineer by Joseph Lippman and Henry Strauss for water rights in the north and west forks of the Duchesne River near Stockton. The plans filed provide for a hydroelectric development of about 12,000 hp. Electricity generated at the plant will be transmitted to Salt Lake City over a high-tension line.

KINGMAN, ARIZ.—The Desert Power & Water Company is planning to erect an electric transmission line to Hackberry and another line extending to Cyclopic mine, 30 miles north of Chloride. The cost of both lines is estimated at about \$90,000.

MALTO, MONT.—Arrangements are being made for the installation of a new generator in the local electric-light plant, which has already been purchased.

EUREKA, NEV.—Handley Brothers, it is reported, have decided to erect a power sheep-shearing plant (to cost about \$3,000) at the Charley Minoletti ranch, about 9 miles north of Eureka.

LAMOILLE, NEV.—The Elko-Lamoille Power Company is contemplating improvements to its local system. The proposed work includes the construction of a new reservoir and piping the waters of the west fork of the stream into it with a pipe line 5000 ft. long.

LAS CRUCES, N. M.—Formal application will soon be made to the United States government for the advancement of \$2,000,000 to be used in the construction of an irrigation canal that is to lead from the diversion dam of the Elephant Butte reclamation project at Lasburg to Montoya, and for the installation at the latter place of a large hydroelectric plant. All money required for the proposed work is to be repaid by the project. The proposed hydroelectric plant is to provide power for operating industries and to supply energy in El Paso, Las Cruces and other towns along the transmission line.

ROSWELL, N. M.—The Roswell Gas & Electric Company is installing two 256-hp. Erie vertical boilers with Erie stokers, two boiler-feed pumps, with heaters and all auxiliaries, a 1200-sq. ft. surface condenser

on Allis-Chalmers engine, erecting a steel stack, 150 ft. high, 6 ft. in diameter, and also moving and raising three 200-hp. Babcock & Wilcox boilers for stokers. C. M. Einhart is secretary.

Canada

CHILLIWACK, B. C.—The cost of reconstruction of the telephone lines of the Chilliwack Telephone Company, recently damaged by storms, is estimated at \$19,500.

PORT MOODY, B. C.—The construction of a new rolling mill on Rocky Point is under consideration by the Port Moody Steel Works. The equipment will include a 6-ton, three-phase electric furnace.

WINNIPEG, MAN.—Tenders, it is reported, will be asked by the Provincial Bridge Commission for lamp standards and for furnishing electricity for lamps and motors required for the bridge, which will be completed about June 1.

BASSANO, ONT.—The purchase of an electrically-driven pumping unit is under consideration by the Waterworks Department.

BEETON, ONT.—Debentures to the amount of \$15,000 have been authorized for the installation of a hydroelectric system in Beeton.

BRADFORD, ONT.—Plans are being considered for the installation of a hydroelectric system in Bradford, for which \$15,600 in debentures has been authorized.

GUELPH, ONT.—Steps, it is reported, have been taken for the development of the unused power on the Speed River. R. H. Clemens, district representative, it is reported, has taken the matter up with the Hydro-Electric Commission and an inspection will soon be made.

LEAMINGTON, ONT.—Negotiations are under way between the Essex County Light & Power Company and the Hydro-Electric Power Commission of Ontario whereby the latter will take over the plant and system of the former.

MERRITTON, ONT.—Tenders, it is reported, will be asked for the construction of a power plant for the Meridian Pulp & Paper Company. The head office of the company is at 355 Beaver Hall Square, Montreal, Que.

NEWBORO, ONT.—The ratepayers have approved a by-law awarding a contract to J. P. Tett & Brothers to supply electricity in Newboro. Energy to operate the system will be obtained from Bedford Mills.

PORT COLBORNE, ONT.—The Town Council is considering the construction of a water-works pumping station and equipment.

TOTTENHAM, ONT.—Arrangements are being made for the installation of a hydroelectric system in Tottenham, for which \$9,000 in debentures has been authorized.

COLERAINE, QUE.—The contract for the entire electrical equipment of the Bennett-Martin Asbestos & Chrome Mines, Ltd., has been awarded to the Canadian General Electric Company.

COLERAINE, QUE.—The contract for wire for the erection of an electric transmission line between the Black Lake station of the Shawinigan Water & Power Company and the Bennett-Martin Asbestos & Chrome Mines, Ltd., has been awarded to the Canadian Wire & Cable Company, and for insulators to the Canadian Force-lain Company of Hamilton.

MONTREAL, QUE.—The Montreal Tramways Company, under the terms of the new 35-year franchise, has been instructed to construct double tracks on about 13 miles of new line. The work is to be begun in June and completed by November.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until Feb. 26 for furnishing bronze, copper, copper and brass tubing, steam traps, Klaxon signals, electric grinders, arc lamps, globes, reflectors, power hack saw, copper cable, etc. Blanks and information relating to this circular (No. 1200) may be obtained from the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

HONOLULU, HAWAII.—Preparations are being made by the Hawaiian Electric Company for the construction of a new electric plant, to be located on Allen Street, between Bishop and Alekele Streets. The cost of the building exclusive of equipment is estimated at about \$300,000.

(Issued Jan. 1, 1918.)

- 1,253,726. INSULATOR. Ferdinand Stebeo, Charlotttomburg, Germany. App. filed July 12, 1914. "Sleeve" insulators for transformer leads carrying currents at very high voltages.
- 1,253,788. ELECTRIC LOCKING DEVICE; Floyd J. Collar, Alameda, Cal. App. filed July 1, 1916. Permutation-lock-controlled switch especially adapted for insertion in the ignition system of internal-combustion engines.
- 1,253,807. AUTOMATIC SIGNALING MECHANISM FOR STARTING ELEVATORS; Allen A. Fuller, Birmingham, Ala. App. filed

Record of Electrical Patents

Notes on United States Patents

Willis R. King, Newark, N. J. App. filed April 16, 1917. For plating articles in bulk.

1,254,056. PROCESS OF MAKING METAL POWDER; William C. Moore, Lakewood, Ohio. App. filed July 29, 1915. Relates to the making of metal powders and also to current-collecting brushes made from the same.

1,254,067. ELECTRIC SWITCH; Clarence D. Platt, Bridgeport, Conn. App. filed June 23, 1917. Entrance switch.

1,254,077. ELECTRIC FURNACE; Frederick T. Snyder, Oak Park, Ill. App. filed Jan. 19, 1911. Tilting.

1,254,079. ELECTRIC SMELTING FURNACE; Frederick T. Snyder, Oak Park, Ill. App. filed March 1, 1917. Improved ore feed adapted for use in connection with smelting furnaces.

1,254,080. ELECTRODE HOLDER; Frederick T. Snyder, Oak Park, Ill. App. filed Sept. 19, 1917. Applies particularly to side holders.

1,254,081. TELEPHONE SYSTEM; Franklin A. Stearn, Paterson, N. J. App. filed July 5, 1916. Type in which automatic switches are employed for distributing to a plurality of operators' positions the calls originated by the telephone lines of the exchange.

1,254,083. MEASURE-SERVICE TELEPHONE SYSTEM; Samuel S. Stolp, Chicago, Ill. App. filed Feb. 29, 1912. Applies particularly to a party line.

1,254,114. PORTABLE ELECTRIC LIGHT; Bernard Benedict, New York, N. Y. App. filed June 14, 1917. Tubular type.

1,254,117. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed Aug. 18, 1917. Systems wherein signals may be either transmitted from or received at the same station.

1,254,118. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed Aug. 18, 1917. Telephone.

1,254,122. SWITCH-OPERATING MECHANISM; Roy V. Collins, West Newton, Mass. App. filed March 9, 1915. Permits the electric motor for operating the switch point to be put in a sealed box in the ground, since it avoids the making of arcs in the motor box.

1,254,135. ADJUSTMENT OF RELAY CONTACT FINGERS; Clinton C. Harrington, Swissvale, Pa. App. filed Sept. 11, 1917. Improvements.

1,254,139. RAILWAY SIGNALING SYSTEM AND RELAY ADAPTED FOR USE THEREIN; John S. Holliday, Wilkensburg, Pa. App. filed June 22, 1916. Improvements.

1,254,146. SIGNALING CIRCUIT; William H. Martin, New York, N. Y. App. filed Aug. 27, 1917. Telephone.

1,254,152. ELECTRIC SIGNAL SYSTEM; James D. Nelson, Cincinnati, Ohio. App. filed Feb. 26, 1917. Produces a signal system in which the resistance of the controlling magnets of the device to be supervised is normally out of the circuit until momentarily introduced therein upon actuation of any one of the supervised devices.

1,254,167. TELEPHONE-EXCHANGE APPARATUS; Charles A. Stickney, Chicago, Ill. App. filed May 15, 1916. Means whereby a coin deposited in a coin box will be under control of the subscriber depositing the coin until the party called has answered the control of the coin then passing from the subscriber automatically.

1,254,168. TELEPHONE-COIN BOX; Charles A. Stickney, Chicago, Ill. App. filed May 15, 1916. Means whereby the subscriber depositing a coin maintains control of the coin until the connection called for by him is completed.

1,254,172. ELECTRIC CONNECTOR; Frederick A. Tefft, Toledo, Ohio. App. filed May 21, 1917. Used to connect a lead line to a battery terminal.

1,254,182. IGNITION SYSTEM; Leo J. Werner, Newark, N. J. App. filed May 29, 1917. Overcomes the difficulty of hard starting by providing means of ob-

taining a spark or shower of sparks at the proper time, no matter how slow the rotative speed of the engine is.

1,254,198. SIGNAL ALARM FOR SWITCHES; Gabor Blesi, Gary, W. Va. App. filed Dec. 19, 1916. Combines with the movable portion of a switch rail means whereby to notify the switchman or other workman when the switch is in open position.

1,254,210. ELECTRIC LIGHT FIXTURE; John H. Dale, New York, N. Y. App. filed April 3, 1915. For use with nitrogen-filled lamps.

1,254,221. ALTERNATING-CURRENT MOTOR; Valere A. Fynn, St. Louis, Mo. App. filed Feb. 14, 1917. Constitutes the motor itself so as to make it possible to derive from its primary the direct current necessary for the speed regulation of the machine.

1,254,223. LOW-VOLTAGE ELECTRIC SWITCH; Monroe Guitt, Hartford, Conn. App. filed June 22, 1917. Automobile.

1,254,242. DIRECTION INDICATOR; Howard J. Lambert, Portland, Ore. App. filed Nov. 18, 1914. Automobile.

1,254,254. INDICATING SYSTEM; William H. Matthies, Hackensack, N. J. App. filed Dec. 29, 1916. Provides an improved arrangement for testing senders.

1,254,265. BELL; Victor W. Page, Bristol, Conn. App. filed Nov. 16, 1911. Motor-driven gongs.

1,254,274. EXPANDING DEVICE FOR SPEC-TACLE RIMS; George E. Pryor, Los Angeles, Cal. App. filed March 6, 1916. Of the class generally known as composition rims.

1,254,288. CABLE TESTER; Christopher D. Stewart, Ottawa, Ill. App. filed June 22, 1916. Improvements.

1,254,290. TELEPHONE METER-SERVICE SYSTEM; Harold D. Stroud, Chicago, Ill. App. filed April 3, 1913. Meter which, instead of registering the number of calls, registers the total time during which the telephone is in use.

1,254,308. METALLURGICAL FURNACE; William Buhl, Carnegie, Pa. App. filed Aug. 20, 1917. Electric type.

1,254,330. SOUND-RECORDING AND REPRODUCING MACHINE; David F. McQuire and Kenneth D. McQuire, Hornchurch, England. App. filed June 1, 1917. Adapted for domestic and office use.

1,254,331. ELEVATOR SIGNAL SYSTEM; Alexis Le Blanc, New York, N. Y. App. filed April 16, 1913. Improvements.

1,254,405. ELECTRIC HORN SWITCH; Edward E. Johnson, St. Paul, Minn. App. filed Sept. 21, 1914. Improvements.

1,254,411. METHOD OF MANUFACTURING METAL FELLIES; Rudolf Kronenberg, Ohligs, Germany. App. filed Oct. 30, 1917. Used on bicycles and other wheels of automotive and any other cars, carriages and vehicles.

1,254,510—Water Jacket for Electric Furnace Electrodes

Aug. 13, 1915. For starting and controlling the movement of a battery of elevators.

1,253,818. TAPE-TRANSMITTING APPARATUS FOR TRANSMITTING ELECTRICAL IMPULSES; Henry Kingsford, Westminster, London, England. App. filed June 7, 1915. Improvements.

1,253,846. COMBINATION CASE FOR FLASH-LIGHTS; Anker S. Lynne, Bridgeport, Conn. App. filed Oct. 19, 1915. Improvements.

1,253,873. WIRELESS RECEPTACLE; Henry T. Paiste, Philadelphia, Pa. App. filed July 24, 1913. Provides a novel form of lamp or plug receptacle which, in addition to being of relatively simple and substantial construction, shall have the connections between its various terminals made of permanently mounted strip metal pieces to the exclusion of wires.

1,253,874. ATTACHMENT PLUG; Henry T. Paiste, Philadelphia, Pa. App. filed July 24, 1913. Adapter or connecting device for interposition between a socket.

1,253,885. ELECTRICAL EXERCISING DEVICE; Alfredo Quinones, New Orleans, La. App. filed March 24, 1917. Improved.

1,253,915. ELECTRIC HEATING ELEMENT; Clifford R. Wassell, Chicago, Ill. App. filed May 3, 1916. Improved.

1,253,983. BRACKET FOR ELECTRIC LAMPS OR THE LIKE; Adolph W. Kuebler, Chicago, Ill. App. filed July 26, 1915. Improvement.

(Issued Jan. 22, 1918.)

1,254,034. COMBUSTION-ENGINE LOCOMOTIVE; Rudolf A. Furrer, Winterthur, Switzerland. App. filed Aug. 17, 1916. The combustion-engine plant is divided, with its two parts or halves in parallel and the shaft of the driven electric generator connected between them, instead of having the generator coupled in line with the engine as is usual with undivided power plants.

1,254,038. RAILWAY SIGNALING; Henry W. Griffin, New York, N. Y. App. filed July 31, 1912. Improvements.

1,254,045. ELECTROLYTIC APPARATUS; James T. King, Toronto, Ont., Canada. App. filed April 19, 1917. Improvements.

1,254,046. MECHANICAL PLATING MACHINE;

1,254,534—Remote-Control Electric Switch

1,254,416. ENGINE-TROUBLE DETECTOR; Samuel Lazarus, Cleveland, Ohio. App. filed Oct. 18, 1915. Particularly adapted for use with an engine having six or a less number of cylinders.

1,254,510. WATER JACKET FOR ELECTRIC FURNACE ELECTRODES; Harold J. Kitchen, Luton, England. App. filed March 7, 1917. Improvements.

1,254,534. REMOTE-CONTROL ELECTRIC SWITCH; Charles E. Pelletier, New Orleans, La. App. filed Feb. 2, 1915. Improved.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER *and* AMERICAN ELECTRICIAN

Volume 71

New York, Saturday, February 23, 1918

Number 8

Our Proselytizing Neighbor

IT MAY be that only a master musician can appreciate the genius of Beethoven, but a mere novice in the power business can detect dissonance in the hum of American industries. For want of fuel from which to manufacture electricity factories in the great industrial state of New Jersey, for instance, are compelled to shut down completely every other day. Industries in other states have been confronted with a like predicament. Such a condition in the power market is not healthy for American industries, and our neighbor to the north is quick to take advantage of it. One of the banks in the prairie provinces, in an advertisement in one of the large metropolitan dailies, called attention last week to Canada's water-power resources, which are at present only about one-tenth developed. As indicative of the possibilities for future industrial expansion, it pointed out that there is 7,000,000 hp. still commercially available in the Dominion and offered to furnish information regarding sites, labor conditions, transportation facilities, etc., to American firms seeking to establish branches or factories there. It is well known that many industries which could not obtain sufficient electricity at Niagara Falls found the authorities on the other side of the border willing to oblige them with power. Others are likely to succumb to the propaganda unless Congress acts quickly on measures now before it. Dr. Steinmetz has a viewpoint on Niagara which we publish this week.

The Curtailment of Lighting

PRESTON S. MILLAR'S paper before the Illuminating Engineering Society last week on this important topic is one of the most valuable contributions to war economics that have yet appeared. The central-station men of the country knew well enough that the resounding calls for saving coal by economizing on electric light had no substantial basis in economic efficiency, but were gags for the gallery, drawing attention to trivial although easily observable savings while the great drains on our coal supply went unchecked. Mr. Millar's study of the facts not only fully upholds these impressions, but leaves the man on the street no excuse for misunderstanding the real truth of the situation. Baldly the facts are these: Of the total coal consumption of the country a beggarly 2 per cent goes to the production of electric light and 1 per cent more would more than cover the additional quantity required for gas lighting. Therefore even the entire abolition

of artificial lighting would save less than 3 per cent of the fuel output. The first point of attack chosen in making a reduction of lighting was the electric sign. Now, granted that the electric sign represents in considerable measure an unnecessarily flamboyant phase of an art in many respects offensive to taste, and which could be curtailed without serious public inconvenience, even if electric signs were wholly abolished the total amount of energy that would thus be saved is not in excess of 5 per cent of the energy used for lighting—that is, one-tenth of 1 per cent of the country's fuel output.

Granting that slight reductions may be made in certain other classes of lighting without serious inconvenience, all these curtailments together would amount to only a few tenths of 1 per cent, far less than if the customary room temperature of buildings were cut down two degrees, enormously less than could be saved by the most casual attention to the wastes of fuel in its ordinary domestic use. Even daylight saving, if carried out at once and on the most liberal scale proposed, would not reduce the total coal required for electric lighting by an amount of the slightest importance in comparison with other and familiar wastes. The truth is that nowhere is coal used more efficiently than under the boilers of a well-conducted central station, nowhere is the energy of coal made available with less difficulty and cost than in the electric distribution proceeding from such stations, and, the trouble with our fuel supply being far more in transportation than in lack of raw material, electric transmission and distribution should be encouraged in every possible way in order to relieve the railroads for the transportation of necessary things which cannot be sent over a wire as big as one's little finger.

Lest it be for a moment thought that the central stations are putting in a plea for the preservation of their own particular business, it should be added that they have cheerfully taken their share of the medicine, although knowing full well that it was everywhere being administered ineffectively. Further, experience has already shown in the months since the beginning of hostilities that the enormous industrial demands for power and for lighting necessary work at night are actually going on to increase the business of the central stations beyond their peace-time requirements, and to an extent in which the savings called for by lighting curtailment of all sorts kindly suggested by the Fuel Administration disappear as a drop in the bucket. Beyond this the central-station industry is a regulated one in which all attempts at profiteering can be checked by legal mechanism now existing and in first-class fighting trim. Can this be said of any other industry necessary to the

public welfare? The attempt at price regulation in foods has merely increased as a whole the cost of living, since turning consumption from controlled to uncontrolled channels is merely a new and compelling temptation to the profiteer, as the results have shown. The necessities of war will take care of the business of the central stations without serious effort on their part. Indeed, their chief difficulty will be in meeting the demands for service and in getting the fuel necessary for that part of their output concerning the importance of which there can be not the slightest question.

If it is necessary to save 50,000,000 tons of fuel per year, the place to save it is in the checking of indiscriminate waste in the ordinary utilization of fuel, waste which is at a minimum in electric light stations, and by curtailing with grim determination the use of fuel in industries the continuance of which is not absolutely necessary to the successful prosecution of the war. That these are somewhat difficult to pick out, in face of the opposition of the loud-crying interests involved, is perfectly true; but this does not excuse the Fuel Administration for not using every possible effort to this end. If it is thought necessary in addition to squeeze out what little saving may be made in electric lighting, good and well, let the authorities go to it, and they may be assured that the central stations will not seriously suffer thereby and will not raise a storm of protest. On the contrary, the central-station industry will go the limit in backing the country, on the safety and prosperity of which its own future depends.

Power for a Textile District

THE rapidly increasing dependence of the textile industry on electric power is strongly emphasized by the large developments recently undertaken in the New Bedford territory which are described in the current issue. The demands of war orders and the need of cheap and reliable power co-operated in an unprecedented demand on the capacity of the New Bedford Electric Supply Company, with the result that in three years it has jumped from 8000 kw. to 52,000 kw., of which the major portion is already in operation. The result has been not only great increase in local service, but extension into distant territory and intercommunication with other utilities. The new plant here described was started in April, 1916, and was originally laid out for three 4000-kw. units and one of 10,000 kw., all turbo-generators of the ordinary type. In seven months from the beginning of construction commercial power was being delivered from this plant. An additional 15,000-kw. unit has recently been put into operation, and another of the same size is shortly to be delivered.

An interesting feature of the plant is the thoroughness with which the question of coal supply has been considered. Events of the past few months have emphasized this particular matter, but it was undertaken with foresight, and adjoining the station is a storage yard of 20,000 tons of coal. Transportation is by water, and the barges are unloaded at the water front by a hoisting tower with a capacity of 150 tons an hour. This fuel is crushed or by-passed as necessary and then either stored in bunkers or distributed to the yard. At present fuel is withdrawn from the yard by a loco-

motive crane with a 50-ft. (15.2-m.) beam, but the full provision presently to be installed will include an electric crane of 250-ft. (76.2-m.) span, covering the whole central portion of the yard, with a capacity for 100 tons an hour. The proper organization of coal-storage supply is likely to be for some time a very vital question in station design, and investment in storage facilities is strongly to be recommended. The general description of the plant contains numerous details of interest to the constructing engineer, but the larger phases of the matter and the relation of this great new plant to the surrounding territory are of particular industrial importance.

Measuring Power Loss in Dielectrics of Three-Conductor High-Tension Cables

IN INDUSTRIAL power transmission the importance of high-tension cables increases year by year because population densities increase year by year. In sparsely settled districts and in open country it is advantageous and economical to transmit power over aerial lines. Within city limits, however, it becomes impracticable to transmit power by high tension except over subterranean cables. Consequently, the characteristics and the design of high-tension cables are constantly assuming greater economic importance.

The losses of power in a cable maintained at constant temperature are due to I^2R losses in the conductor and to E^2G losses in the insulator. The linear conductance G includes, however, more than the mere transfer of electrons through the dielectric. It includes also a component due to dielectric hysteresis. Both R and G increase with temperature, although their rates of increase are not the same. Consequently the higher the temperature of the cable the greater the linear loss and the greater the linear production of heat. Each and every cable dielectric has a certain limiting temperature beyond which it is not safe to operate because of rapid ensuing deterioration. The economic problem of operating efficiently any cable once installed consists in working it as nearly continuously as possible up to its safe temperature, but never above this value. The cable temperature at its hottest spot is thus the essential criterion of operation.

In studying experimentally the dielectric power loss in a cable under adjustably varied voltage or temperature it becomes important to measure the power loss, with satisfactory precision, in a test cable sample only a few meters long. In the common case of three-cored cable it is also important to measure this loss by three-phase methods, lest there should be a discrepancy between three-phase and corresponding single-phase dissipation. It is not easy, however, to measure a few watts at a dozen kilovolts three-phase and at a power factor of only a few per cent. Special wattmeter apparatus has to be used and calibrated for such measurements.

In a paper on this subject recently read by F. M. Farmer before the American Institute of Electrical Engineers the preparation and use of a high-sensitivity three-phase reflecting wattmeter is described in connection with such tests. By this means satisfactory wattmeter tests are reported on 3-m. lengths of three-phase cable in the laboratory.

It appears from the paper that the linear watt loss increased somewhat more rapidly than the square of the

voltage, between 5 kv. and 17 kv., and more rapidly than the third power of the cable temperature, between 50 deg. and 120 deg. C. These results are such as might have been expected in regard to voltage, but are very surprising in regard to temperature. When it is considered that doubling the cable temperature within this range may increase the linear power loss more than ten times, the importance of an accurate knowledge of the working temperature of such cables becomes self-evident. We may expect to see recording cable thermometers come into extensive use in central-station operation.

The Selection of Circuit Breakers

THE oil circuit breaker has become a very essential part of electrical equipment, and inasmuch as it is the chief defense against the disastrous results of short circuits its capacity for doing its work is all-important. Therefore the A. I. E. E. paper by Messrs. Hewlitt, Mahoney and Burnham on this topic is one of direct and vital interest to the central station. It is comparatively easy to find out experimentally in the light of experience what a given circuit breaker will stand. The difficulty of the situation lies in estimating the burden which will be suddenly thrust upon it. The capacity of a breaker has been commonly stated in terms of the alternator capacity at a specified reactance, assuming generally normal operating pressure. The actual conditions which may be imposed on the apparatus depend on a far greater number of factors, including several which cannot be readily foretold.

The line of attack upon this difficult problem made by the authors is an approximation, involving only reactance and a somewhat conventionalized time-current decrement ratio. Curves representing the latter are based by the authors on effective current values rather than corresponding peak values and also take into account the increased flux due to the assumed load conditions. The data concerned have been founded on careful experimental study, and a series of examples covering common and typical cases are worked out to show the short-circuit currents for which allowance must be made and therefore the necessary capacity of the circuit breaker. The method seems to lead to an approximate solution of direct value to the engineer and to represent a material advance in a particularly difficult line of investigation. With the great increase in the capacity of generating stations and in the extent of the distribution networks, results of a breakdown are so serious that investigation of the circuit breaker problem cannot be too thorough, and the one before us appears to represent a long step in the right direction, since it puts the working data for ordinary cases upon a sound experimental basis.

Effects of Frequency and of Wave Form on Vapor Rectifiers

THE mercury-arc rectifier for obtaining direct currents from a single-phase alternating-current circuit is a valuable piece of apparatus and is especially useful for charging storage batteries when direct-current mains are not available. The great advantage of such a rectifier is that it employs no rotating machinery. If any motion of parts can be said to exist in the rectifier, it is the rectilinear motion of electrons within the evacuated chamber.

The behavior of a mercury-arc vacuum tube in a simple direct-current circuit may be outlined fairly well for most practical purposes by saying that the tube introduces a nearly steady drop of potential or counter emf.; so that the power lost in the tube is likewise steady and the output bears a simple relation to the power input when the current and voltage at either end are known. When, however, an alternating-current circuit is the source of power the behavior of a rectifier is not so simple. Two rival theories have developed for arriving at an expression of the tube losses. The first theory minimizes the influences of frequency and of wave form at the alternating-current input terminals and concentrates attention on the apparent voltage drop taking place in the tube. This apparent voltage drop is held to remain roughly constant over the range of working currents employed, so that the tube loss and tube efficiency can be readily computed to a first and ordinarily sufficient degree of approximation when the terminal conditions are known. The second theory magnifies the influences of frequency and of wave form and holds that any proper estimate of the tube losses must take both of these considerations into account.

It is doubtful whether there is any serious discontinuity between the two theories above mentioned. The first theory does not seriously deny the possible influences of frequency or of wave form. It merely seeks to overlook these, as of relatively minor importance, for ordinary practical purposes. If, indeed, the losses in a mercury-arc rectifier were entirely independent of frequency or wave form, the device would in these respects be entirely different from any employed in connection with alternating-current circuits. There is always some effect of frequency and some effect of wave form. The only question from an engineering point of view is as to the amount of such influence.

The article by Dr. William Tschudy which we print this week goes to show that the tube loss is very appreciably increased by irregularities in wave form, as well as by increase in frequency, between the limits at least of 40 and 110 cycles per second. We hope that the question will be discussed further in our columns. There is undoubtedly room for more investigation in this matter.

IN THE next issue of the ELECTRICAL WORLD a representative of a Middle West electric service company will tell how he avoided a considerable loss when it became necessary to change the frequency of the system. He will outline in a very convenient way the modifications which were made in all different types of meters to adapt

The Coming Issues

them to the change. Prof. C. E. Clewell will again contribute to this issue, his subject being the use of graphic meters in motor application work. Among other subjects which will be discussed will be the initial current and voltage rush in incandescent lamps of the vacuum and gas-filled types when first connected with the supply circuit.

New 52,000-Kw. Station of New Bedford Company

Engineering Features of Largest Steam-Turbine Plant in South Massachusetts, Which Supplies Important Textile District with Power and Is Interconnected with Other Utilities in Buzzards Bay and Cape Cod Region

THE increased production demanded of Massachusetts textile plants by war orders and a growing appreciation of the value of central-station power have resulted in the expansion of the generating facilities of the New Bedford Gas & Edison Light Company from a rating of 8000 kw. in 1915 to a designed capacity of 52,000 kw. in 1917, 37,000 kw. of which is now installed in a new station on Cannon Street, New Bedford, the largest turbine plant in southern Massachusetts. The output of the company shows an increase for the first six months of 1917 of 86.7 per cent to 207.1 per cent above the corresponding months of 1916. Among the factors that have led to the sudden general realization of the value of central-station service are the present high cost of fuel and the shortage of capital for industrial plant development. From a company giving purely local service on

kw. unit was authorized in the summer of 1916 and is now being operated in the station; a second 15,000-kw. unit will be delivered shortly, the building having been extended last fall to house the machine and its auxiliaries. The old Coffin Street station is being dismantled and the equipment disposed of with the exception of four boilers, two 4000-kw. turbo-generators and auxiliaries, which have been scheduled for service in the new plant.

The Cannon Street station is situated on the shore of Buzzards Bay, which assures an ample supply of condensing water and coal delivery by barges. The plant is near the company's load center, within about one-half mile (0.8 km.) of the business section and practically half way between the groups of textile mills at the north and the south ends of the peninsula on which the city stands. A side track of the New York, New Haven & Hartford Railroad enters the turbine room. The plant is well outside the residential district, away from the fire risk associated with that part of the city. Adjoining the station is a yard with a storage capacity of 20,000 tons of coal, at present equipped with an automatic railway, locomotive crane, tracks, hoisting

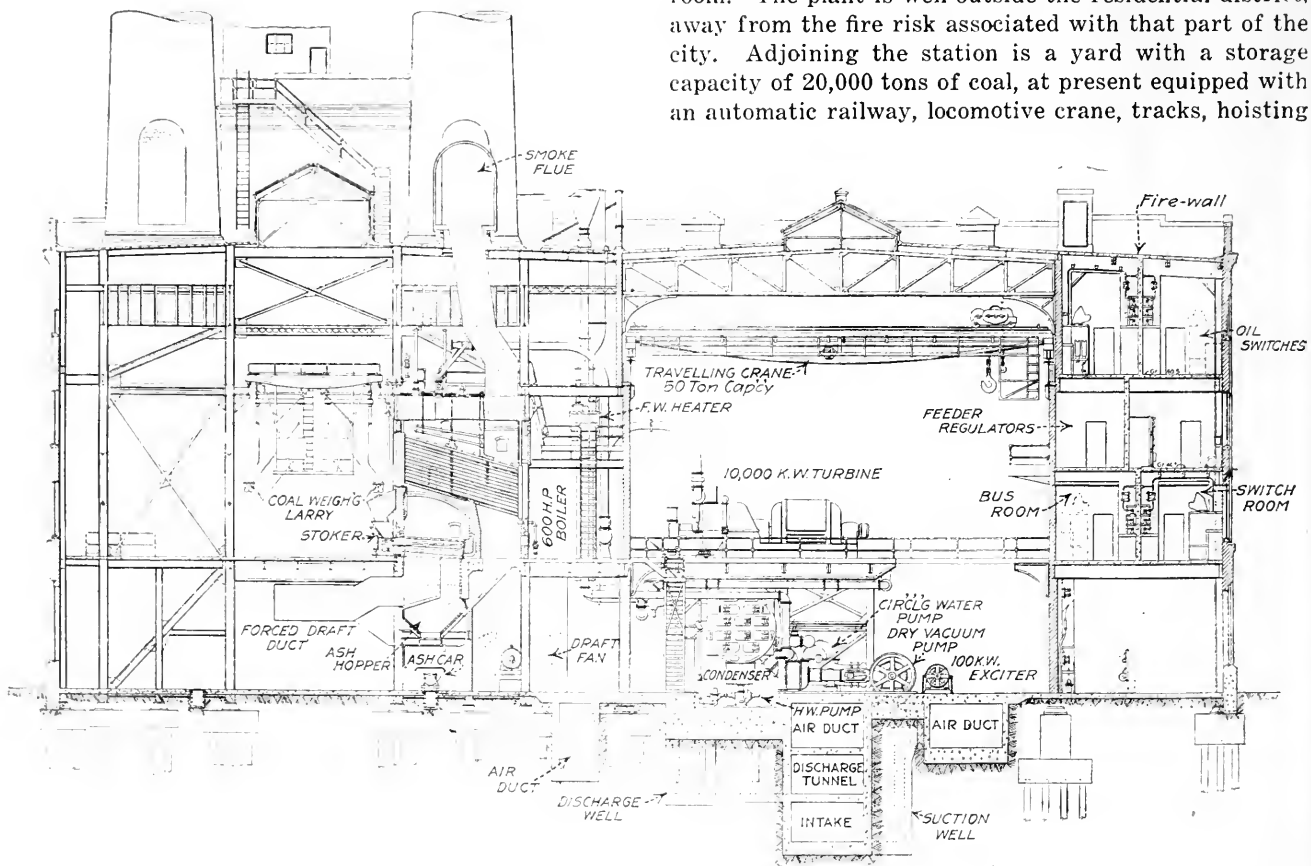

FIG. 1—ARRANGEMENTS FOR DISTRIBUTING COAL TO BOILERS; SMOKE BREECHINGS ON ROOF ARE AMONG FEATURES SHOWN

a small scale this organization has lately developed to a point where its service extends into distant territory. Through interconnection with other utilities maximum efficiency of electrical supply is afforded over a wide area of utilization.

The Cannon Street station was laid out for three 4000-kw. units and one 10,000-kw. set. A 15,000-

tower and other facilities for fuel supply on a large scale.

Coal is now temporarily stored in a 1000-ton bunker situated at the east end of the boiler room on the center line of the firing aisle, but sufficiently above it to enable coal to be handled from the bunker to the boilers by an electrically operated traveling larry run-

ning from end to end of the building. A basement 20 ft. (6-m.) high extends under all sections of the station.

ELABORATE COAL-HANDLING FACILITIES

Coal is brought to the station in barges and unloaded at the waterfront by a hoisting tower built by the Maine Electric Company, Portland, Me., its capacity being 150

recently purchased a second crane of the locomotive type for yard service. This unit is a McMyler 20-ton outfit and, with the first crane, will be used in trimming and reclaiming the coal and also in handling ashes outside the station.

This coal-handling installation is to be improved later by the removal of the automatic industrial railway and

FIGS. 2 AND 3—DOUBLE-ENDED COAL-WEIGHING AND DISTRIBUTING LORRY AND ONE SIDE OF BOILER-ROOM AISLE

tons per hour. The tower is equipped with a 50-ft. (15-m.) boom, the main hoist being provided with a 1½-cu. yd. (1.26-cu. m.) Haywood clamshell bucket and driven by a 225-hp. General Electric 550-volt induction motor. The trolley on this hoist is driven by a 50-hp. motor. The tower is equipped with a Robbins two-roll coal crusher driven by a 30-hp. motor. The coal is fed to the crusher or by-passed immediately after being hoisted from the barge and is then delivered by gravity into a 3.5-ton receiving hopper, from which it is discharged into an automatic industrial railway car and distributed around the storage yard by gravity dumping and automatic tripping or else fed into an elevated receiving hopper near the north wall of the station. The industrial railway has a capacity of 120 tons per hour. From the receiving hopper outside the plant a swiveling belt conveyor driven by a 7.5-hp., 550-volt motor delivers the coal into either of two track hoppers set in the ground just outside the coal bunker section of the power house. Two 1-ton Hunt skip hoists driven by two 30-hp. motors elevate the coal to the bunker, the hoists being operated by Cutler-Hammer push-button control and solenoid-type switches.

Coal is reclaimed from the yard by a 15-ton steam-driven Link-Belt locomotive crane with 50-ft. (15-m.) boom and 1.5-cu. yd. (1.12-cu. m.) bucket, running on a standard-gage track serving the various parts of the yard and carried over the track hoppers adjoining the bunker house. From the storage yard coal is loaded into a 20-ton hopper-bottom gondola car by the locomotive crane for delivery to the track hoppers, the crane being used to drill the car about the yard. The company has

the provision of an electric crane of 250-ft. (76.2-m.) span which will cover the central portion of the yard and enable fuel to be handled directly from the storage piles to the track hoppers and reclaimed with maximum convenience. The crane will have a capacity for handling about 100 tons per hour and will be equipped with a bucket of about 2 cu. yd. (1.52 cu. m.) capacity. The present locomotive crane can transfer about 60 tons

FIG. 4—OUTDOOR COAL-HANDLING FACILITIES

per hour into the skip-hoist pit. A second unloading tower will also be required in the future, when both towers will be equipped for service on a track system to be constructed on the waterfront, following the completion of bulkhead improvements now under way.

Coal is discharged from the bunker at the end of the

boiler house into a Mead-Morrison larry with two 12-ton hoppers which are equipped with Fairbanks ticket-registering scales. The larry is operated along the firing aisle at a maximum speed of 100 ft. per minute by a 7.5-hp., 550-volt General Electric induction motor, and discharges into the stoker hoppers on either side of the boiler room. The convenience of this arrangement is illustrated by the fact that when the boilers were first placed in service and before the full staff of the station was transferred from the Coffin Street station one man operated the larry, cleaned the fires and supplied four boilers with 60 tons of coal in eight hours, also looking after the service of the four units.

FEATURES OF BOILER AND FURNACE EQUIPMENT

The boiler room is designed to accommodate sixteen 600-hp. boilers set in eight batteries, four on each side of a firing aisle 16 ft. (4.8 m.) wide. Ten Babcock & Wilcox boilers are now in place, each being designed for operation at 200 lb. (14.2 kg.) steam pressure and 125 deg. Fahr. (51.7 deg. C.) superheat. Four of the sixteen

hopper-bottomed car running on a narrow-gage track leading to a 30-ton ash pit outdoor. This service will shortly be provided by an Elwell-Parker 2-ton industrial electric truck.

Another useful feature is the provision of 18-in. (25.72-cm.) nipples in place of the usual 9-in. (12.86-cm.) connections between the header and the steam drum. This gives much more room than is ordinarily the case for inspection and repair work around superheater and drum and makes it possible to rivet or calk a drum without removing the superheater.

The hopper above each stoker is designed to hold about 2.5 tons of coal. A slot-shape opening has been left between the upper and lower parts of the hopper which enables the fireman to see when the coal is low.

The air supply for the furnaces is taken from the basement and forced into a duct system under the firing-aisle floor which feeds the stoker wind boxes. Four Green fans driven through Falk reduction gears by Terry steam turbines provide the forced draft.

The products of combustion are discharged from the

FIGS. 5 AND 6—SOME OF THE AUXILIARY DRIVES

boilers will be equipped with Babcock & Wilcox superheaters and the remainder with Foster superheaters. The boilers are designed for operation at 300 per cent of their rating, their maximum efficiency being attained at 160 per cent of rating. The boilers equipped with B. & W. superheaters came from the Coffin Street station. All the boilers are equipped with the Combustion Engineering Company's type E underfeed stokers.

An unusual feature of this installation, suggested by R. H. Barber, chief engineer of the station, is an arrangement whereby the dust chamber of the rear pass at the back of the bridge wall can be cleaned by opening a damper discharging into the ash hopper, as shown in the station cross-section reproduced herewith. A windlass is provided in the basement below each damper for operating the latter by hand. The arrangement, in the opinion of the operators, is far superior to the usual method of cleaning out the dust chamber by shoveling or vacuum system. With the New Bedford arrangement a boiler dust chamber can be cleaned when the boiler is in service, the fire room is relieved of the dirt and dust usually associated with cleaning, and the staff is saved a vast amount of personal discomfort.

Ashes are dumped from the furnace ash pits into a

boiler uptakes into inclined breechings leading through the boiler-house roof to horizontal smoke ducts running along the roof and joining two reinforced-concrete stacks. The first 75 ft. of the stacks (22.86 m.) is brick-lined to resist the action of the gases. By placing the stacks midway between each end of the firing aisle and discharging smoke into them from each side the steam generating equipment does not have to be separated for stack foundations, the symmetry of station is improved, the size of building for a given boiler capacity is minimized, and some of the boilers can be placed directly under the stacks. The stacks were built by the New York Concrete Construction Company and are equipped with lightning rods. The flue-gas temperatures in this station ordinarily range between 550 deg. and 575 deg. Fahr. (about 293 deg. C.), or about 15 deg. below the steam temperature, including superheat at the boiler uptake. The stoker fan engines are controlled by the steam pressure and the stoker engines by the air pressure in the wind boxes; the system being the so-called balanced-draft type, furnished by the Engineer Company, New York.

This article will be continued in a subsequent issue of the ELECTRICAL WORLD.

Mobilizing Niagara to Aid Civilization

All Its Power Is Urgently Needed by the State and Nation, and Tourists Could View the Mighty Cataract on Sundays and Holidays

BY CHARLES P. STEINMETZ

THE unprecedented and acute shortage of power which now confronts us and threatens seriously to interfere with the efficient prosecution of the war again turns our eyes to Niagara, where water capable of producing millions of kilowatts rushes uselessly over the cliffs.

At the same time we must realize that the present situation is not unexpected, nor was it unavoidable. The emergencies of war times have merely made a sudden and acute condition of a situation which has been coming on for a long time and would sooner or later have overtaken us. We thus turn again to a fuller use of Niagara's power, too late indeed to get the full benefit of it in our present emergency.

In the discussion of the development of Niagara's power versus the preservation of the natural beauty of the falls two features have to be recognized:

(1) The falls are doomed in any case, and sooner or later, with the increasing power demand of modern civilization and increasing shortness of power, self-preservation will force us to use Niagara's power to the fullest extent; that is, let the falls run dry.

(2) It is too late to preserve the natural beauty of the falls. That could have been done a hundred years ago, but not now, when there is no place at or around the cataract where one's sense for nature's wild beauty is not offended by the sight of some ugly modern hotel, some tower or steel bridge.

About fifteen years ago I proposed a plan which, while using the full power of the falls, would preserve their beauty to the sightseer. At that time the suggestion was not taken seriously—the demand for the

power was not then so urgent as to-day—and therefore I repeat it now.

Suppose we permit the complete development of Niagara's 10,000,000 kw., more or less, for electrical purposes, let the falls run dry, but on every holiday and Sunday have the power houses shut down, the power consumption reduced to the minimum possible—say 10 per cent of the full capacity—and so have the falls running again in their ancient grandeur. We could thus satisfy the demands of modern industry and at the same time satisfy the lovers of nature; and, more than that, we would then see a sight which can be seen nowhere in the world—the starting of the falls, when on Sunday morning the water would first begin to trickle over the bare cliffs and then gradually rise to be the giant falls of old.

As the government controls the falls, it would involve no serious difficulty, probably not even require legislation, to give the license for the unlimited use of power with the condition that during Sundays and holidays the power consumption must be reduced to 10 per cent of the maximum.

In considering the full development of Niagara's power we must remember that some hydraulic engineering work will be required to insure uniformity of the flow of water, for Niagara fluctuates in its quantity with the shifting of the winds on Lake Erie. However, the cost of such a development per kilowatt would be insignificant. It probably would mean a movable dam across the Niagara River at Buffalo to restrict the flow when the lake was high and open it wide when the lake was low.

Applications of Flywheels in Motor Operation

Theoretical and Practical Consideration of the Effect Which They Exert—Good Results Are Achieved Where Load Equalization Is an Object—Excess Inertia Disadvantageous with Some Machines

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

Theoretical notes on the use of flywheels for the equalization of loads, with a reference to cases where flywheel effect may be a disadvantage. Outline of applications of flywheels to motors, with descriptive notes on the Ilgner system as an example. Value of flywheel effect in the operation of hoisting-machinery reversing rolls in steel mills and for improving service conditions.

FLYWHEEL effect is sometimes favorable and other times unfavorable to the operation of motors and motor-driven machinery. The former is true where flywheels are used for load equalization, some cases being referred to in the following notes. The disadvantages of flywheel effect become evident in connection with some machine tools like the planer, where an excess inertia in pulleys and in the motor armature increases the difficulty of reversing the movement of the platen.

Some idea of the dimensions which may occur with pulleys on planer equipments may be gained from Fig. 3, which refers to a non-reversing motor-driven equipment. To reduce the flywheel effect aluminum has been used to some extent for planer pulleys. Reduction of the diameter of the motor armature may also make a considerable reduction in the flywheel effect. Calculations indicate that changing the diameter of a 19-in. (39.26-cm.) armature only 5 in. (12.7 cm.) changes the flywheel effect about 100 per cent (Popcke). The same authority points out the rather remarkable fact that a 7½-ton planer platen when moving at a speed of 100 ft. (30.5 m.) per minute has only about one-twenty-fifth of the inertia of a 35-hp. motor when operating at a speed of 1000 r.p.m. These figures give some idea of the possible magnitude of the flywheel effect from the rotational elements of motor-driven ma-

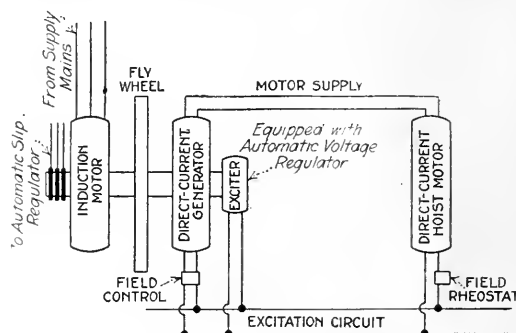

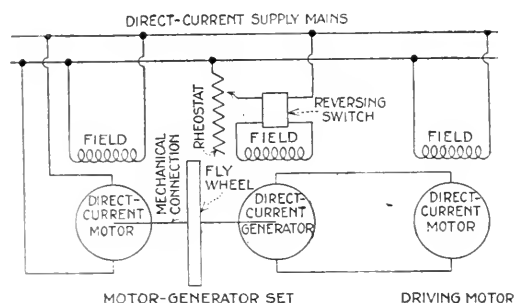

period the flywheel effect can be made to perform a useful function, as will be described later.

Of the two general methods for preventing disturbances due to excessive load fluctuations—by storage battery and by flywheel—the former is applicable to carrying peak loads in central stations, but the latter is not suited to such conditions, since the peak loads exist too long. The flywheel is strictly a "momentary load" absorber or carrier. This is well illustrated by the fact that a given flywheel may be able to handle, say, a 100 per cent overload for a period of one second, while the same flywheel might be entirely incapable of handling even 50 per cent overload for, say, five seconds.¹

The so-called "flywheel effect" is the product of the weight of the flywheel and the square of the radius of gyration, while the amount of energy which such a wheel can give up depends on the difference of the squares of the initial and final speeds. A good idea of the flywheel action upon a motor in which the load torque suddenly changes from a lower to a higher value may be gained from the following equation:

$$T = T_1 - (T_1 - T_0)/e^{at},$$

where T_0 represents the initial constant opposing or load torque and T_1 a new constant and higher value of the opposing or load torque, the change from T_0 to T_1 taking place suddenly. In this equation T represents the torque developed by the motor t seconds after the opposing torque was T_0 . The constant a is defined by the following relation: $a = 308R/K^2WN$. R is the ratio of the torque in pound-feet to the slip (an induction motor is assumed) for the given motor, obtained from the motor characteristic curves; K is the radius of gyration of the flywheel in feet (ignoring the inertia of the other rotating parts, which are usually negligible

FIGS. 1 AND 2—SIMPLIFIED DIAGRAMS OF ILGNER SYSTEM FOR DIRECT-CURRENT AND ALTERNATING-CURRENT SUPPLY

chinery and indicate the extent of their disadvantage in reversing applications.

It should be clearly noted that the objection to flywheel effect in reversing service as just outlined refers merely to the difficulty in accomplishing the reversal. Another and important characteristic of reversing service is the excess momentary demand made on the motor-supply circuits at the time of reversal. During this

when compared with that of the flywheel); W is the weight of the flywheel in pounds and N the synchronous speed of the motor in r.p.m.

In the original equation e is the base of the natural logarithm, and hence the torque T developed by the

¹"American Handbook for Electrical Engineers," p. 547; section by D. B. Rushmore and E. A. Lof. The discussion of the following equation is based on this section.

motor does not change instantly when the load torque increases from T_0 to T_1 , but it increases slowly, depending on the factor a . An inspection of the elements which constitute this factor shows that a may be made small (the condition for a slow increase in the motor torque T for a sudden increase in load) by the use of a flywheel possessing a large flywheel effect, by using a

FIG. 3—TYPICAL PLANER DRIVEN BY NON-REVERSING MOTOR

high-speed motor, or by using a motor with large slip for a given torque. Hence if the flywheel effect is made large enough the motor torque may change only slightly when the load increases momentarily, and the load requirements may be back to normal conditions again before the motor torque has had time to change to any extent.

PRACTICAL CASES

To illustrate these theoretical points several practical examples will be given. In the operation of reversing rolling mills in steel plants direct-current motors are commonly employed for driving the rolls. To prevent excessive fluctuations in the supply circuits during the

FIG. 4—250-KW. INDICATOR-MOTOR GENERATOR SET

reversing periods the Ilgner system, consisting of a flywheel motor-generator set, is commonly employed. The motor of this set may be either direct-current or alternating-current, although in large outfits the motor of the set is of the polyphase induction type, with arrangements for automatic changes in the rotor resistance so as to increase the slip for excessive loads.

The generator of the set is of the direct-current type with a field reversing switch and a rheostat, permitting wide adjustment of the excitation. The armature of the direct-current generator and that of the driving motor are connected directly to each other, as in Figs. 1 and 2.² Changes in speed of the driving motor are thus effected by changing the direct-current generator voltage through adjustments of its field rheostat, and reversal by changing the polarity of the direct-current generator.

The function of the flywheel in such cases is to minimize fluctuations in the supply circuits which furnish current to the motor of the motor-generator set. For successful operation there must be a sufficient drop in speed of the left motor in Figs. 1 and 2 to enable the flywheel to give up the required amount of its stored energy according to the equation³ $W(V_1^2 - V_2^2)/(2g \times 550) =$ energy available from the flywheel in hp.-seconds. W is the weight of the flywheel in pounds, V_1 is the maximum velocity of the flywheel at its radius of gyration in feet per second, V_2 the minimum velocity at its radius of gyration in feet per second, and g the acceleration due to gravity (32.2 ft. per second per second). This equation implies that some arrangement must be provided for the control of the motor of the motor-generator set.

While the flywheel motor-generator set is the equipment most widely used for load equalization, other types are commercially available, such as the flywheel motor balancer and the use of the auxiliary induction motor drive for large hoists with flywheel equalization. Taking up the flywheel motor generator equipment, the practice of one manufacturer⁴ is to use a wound rotor induction motor for driving the set. An adjustable rheostat is connected to the collector rings of this motor (Fig. 2) and its control governed by the input to the induction motor. One type (a usual form) of this rheostat is known as the "liquid slip regulator," which is controlled by a small auxiliary induction motor, the phases of which are each connected in series with one of the mains which supply the main induction motor.

Utilization of the stored energy in the flywheel is accomplished as follows: If the current supplied to the

²Figs. 1 and 2 are simplified diagrams based on standard diagrams for these systems as found, for example, in the "Standard Handbook for Electrical Engineers," pp. 565 and 1215. Figs. 3, 4 and 5 are shown by courtesy of the Crocker-Wheeler Company.

³Wilfred Sykes, "Standard Handbook for Electrical Engineers," p. 1250.

⁴General Electric Company. See Bulletin No. 48,014, pp. 18 and 19.

main induction motor (Fig. 2) rises above some prescribed value, the torque of the small auxiliary induction motor, whose phases are in series with the main supply leads, increases, and this in turn lifts the electrodes of the liquid slip regulator, thus inserting additional resistance in the rotor circuit of the main induction motor.

This action causes the set, and consequently the flywheel, to slow down; the input to the main induction motor is limited, and the flywheel gives up its stored energy. This helps out the main induction motor and prevents excessive peaks in its load. When the load on the set is reduced the reverse action takes place, since the reduced torque of the auxiliary regulating motor causes a decrease in the rotor adjustable resistance, an increase of the main motor speed, and energy is thus again stored in the flywheel for use at the time of the next peak load on the driving motor (to the right in Figs. 1 and 2).

In rolling-mill practice the speed variation to permit storing and utilizing energy in the flywheel may amount to 15 or 20 per cent. Test curves of a flywheel set of this kind show that the flywheel is capable of limiting the load taken from the supply mains to about one-fourth of the maximum output of the generator of the motor-generator set.

This description of the flywheel set, as commonly

in quantity and quality, on the work to be performed.

From the standpoint of the flywheel an increase in the factor ($V_1^2 - V_2^2$) may mean (a) a lower cost for the flywheel and (b) reduced power for its operation. Obviously, therefore, the design of the flywheel and of the motor as a unit involves factors which are opposed to each other and necessitate an engineering balance.

One of the largest and most interesting examples of a flywheel-set installation is that of the motor-driven 35-in. (88.9-cm.) blooming mill at the Lehigh plant of the Bethlehem Steel Company.* This flywheel set is capable of handling a 19-in. by 23-in. (39.26-cm. by 39.42-cm.) ingot weighing 10,000 lb. (4535 kg.). Direct motor drive is employed with two 600-volt motors, which develop a maximum torque of 1,550,000 ft.-lb. (214,000 m.-kg.) and a maximum horsepower of 12,000. Two generators are employed. The rated power of the driving motor is 2000 kw. From the flywheel end, two points are of special interest, namely, the weight of the flywheel, 100,000 lb. (45,359 kg.), and its speed of 375 r.p.m.

Considerable attention was given the choice of this speed, which not only affects the operation of the flywheel, but also the design of the generator. It is pointed out that a speed of 500 r.p.m. might have been used for this Bethlehem set as far as the design of the generators was concerned, but that the use of the lower

FIG. 5—2000-KW. FIVE-UNIT FLYWHEEL INDUCTION-MOTOR GENERATOR SET (WITHOUT MOTOR)

used, indicates that the use of the flywheel has an influence on the design of the motor to which it is applied. It has been pointed out³ that the design of the motor and flywheel as a unit ought properly to be a compromise between (a) the advantages sought by the use of a flywheel and (b) those disadvantages which result from the special features required in the design of the motor if the flywheel is to be effective. Summarizing, Mr. Pauly says, in effect, that to increase the range of speed over which the flywheel motor unit is to operate for the purpose of increasing the ($V_1^2 - V_2^2$) factor in the equation for energy given up by a flywheel may have the following effects: (a) Higher cost of the motor, (b) reduced motor efficiency, (c) extra complications in the control scheme, and (d) a considerable effect, both

speed (375 r.p.m.) gave a greater margin as an allowance for uncertainties in operating this equipment.

Cast-iron flywheels are most commonly used in installations comparable with rolling-mill drive, and have a limiting peripheral speed of about 6000 ft. (1828.8 m.) per minute. With special construction peripheral speeds as high as 30,000 ft. (9144 m.) per minute are used.⁴ Some idea of the safe maximum speeds in r.p.m. for various diameters of the flywheel may be gained from the table⁵ for cast-iron flywheels with solid rims. This table, however, is merely illustrative, since the maximum safe speeds are a function of the kind of flywheel and of the allowable stresses in the wheel.

Factors Affecting Vapor-Rectifier Performance

Bulb Losses Greatly Dependent on Wave Form, Frequency and Anode Current—
Refutation of Some Other Conclusions That Have Been Erroneously
Drawn from Imperfect Investigations

BY DR. WILLIAM TSCHUDY

SOON after the results of the writer's extensive investigations¹ with mercury-vapor rectifiers were published, the Physikalische Reichsanstalt² presented some investigations on the same subject which seemed to contradict³ those made by the writer. Since it is not only

FIG. 1—LOAD CHARACTERISTICS OF A RECTIFIER FOR CONSTANT PRIMARY VOLTAGE AND NORMAL FREQUENCY (SEE TABLE III)

of theoretical interest but of practical importance to have correct ideas on this matter, the writer thinks it worth while to make a detailed comparison of the two investigations in order to demonstrate the correctness of his earlier conclusions.

The Physikalische Reichsanstalt draws the following conclusions: (1) The watts loss in a rectifier bulb can be represented by the voltage drop in the mercury arc; (2) this drop or loss decreases slightly with an increase of the anode current and (3) is independent of the wave form and frequency of the current which is rectified.

To sustain these claims the following reasoning and tests (Tables I and II) were presented: If *i* represents the instantaneous value of the anode current and *e* the instantaneous value of the anode voltage, then the watts loss is

W_g = \frac{1}{T} \int_0^T i e dt

where *T* is the length of one period. During the time when the instantaneous current values are greater than zero, the instantaneous voltage values are considered constant⁴, therefore

W_g = \frac{e}{T} \int_0^T i e dt

or *W_g* = *eI_m*, where *I_m* is the average value of the anode

current and *e* is identical with the voltage drop in the mercury arc and is considered constant.

In connection with Table 1,⁵ from which conclusions (1) and (2) were drawn, it was apparently assumed, although not definitely stated, that the primary voltage of the rectifier was constant. In Table II,⁶ from which conclusion (3) is drawn, it must be pointed out that the primary voltage of the rectifier and the output are not recorded. Furthermore, no data confirming the conclusion that the bulb loss is independent of the wave form are given.

From investigations⁷ made by the writer, however, he is led to believe that the bulb losses are greatly dependent on the wave form, frequency and anode current, and that the Physikalische Reichsanstalt conclusions are incorrect. Assuming that the reader already knows the correct definition⁸ of bulb loss, it is evident that it is incorrect to consider the voltage drop in the mercury arc as a loss. Neither is voltage drop *e* constant for all anode currents, since there is a variation of 18 per cent as shown by Table I. Besides, there is a difference between measured and calculated values of *e*, so that in total there is a difference of about 20 per cent. Therefore the assumption that the voltage drop *e* is constant has to be made with precaution.

With the arrangements shown in Fig. 3 the writer obtained the data⁹ shown in Table III for an absolutely constant primary voltage of 110 volts and a frequency of 50 cycles when the load was increased step by step. Results¹⁰ were also secured with a constant primary

FIG. 2—BULB AND RECTIFIER EFFICIENCIES AT DIFFERENT OUTPUTS AND WITH THREE WAVE FORMS

voltage and different frequencies. The transformer bulb and rectifier efficiencies η_1 , η_2 and η_3 respectively are shown in Fig. 5 as functions of the normal frequency (50) and a constant primary voltage (110).

To study the influence of wave form upon the efficiency of a mercury-arc rectifier, the writer used two

generators which had approximate sine-wave emfs. that differed only slightly as shown by their equations:

$$e = 142.2 \sin (2\pi nt - 0^\circ 29') + 0.997 \sin (6\pi nt + 9^\circ 30') + 0.341 \sin (10\pi nt - 9^\circ 30') \quad (1)$$

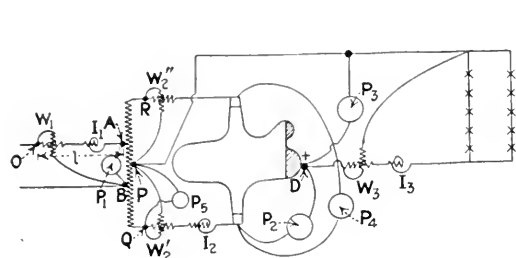

$$\text{and } e = 142.0 \sin (2\pi nt + 0^\circ 23') + 2.19 \sin (4\pi nt - 8^\circ 45') + 2.67 \sin (10\pi nt + 0^\circ 25'). \quad (2)$$

TABLE I—RELATION BETWEEN BULB LOSS, VOLTAGE DROP AND ANODE CURRENT (G. SCHULZE)

I_m is the average value of the anode current; I_{dyn} , which means the current determined by a dynamometer, represents the effective value of the anode current; W_g is the bulb loss determined by method shown in Fig. 1; $W_g/I_m = e$ is the calculated voltage drop; while the last column shows the voltage drop measured directly for different values of anode current.

I_m	I_{dyn}	W_g	$W_g/I_m = e$	e
9.45	9.87	99	15.5	15.4
7.09	7.47	110	15.9	15.7
4.96	5.23	114	17.1	16.5
3.27	3.48	128	18.7	17.8

Still the bulb losses differed as shown in Fig. 6 even

FIGS. 3, 4 AND 5—METHOD OF MEASURING TRANSFORMER AND BULB EFFICIENCY SEPARATELY AND COMBINED; METHOD OF DETERMINING BULB LOSSES DIRECTLY, AND RELATION OF TRANSFORMER, BULB AND RECTIFIER EFFICIENCIES TO OUTPUT

I indicates effective current; P the effective voltage; W power or loss; W' corrected power values. The rectifier input $W_1' = W_c + W_i + W_g + W_s'$, where W_c is the copper loss, W_i the iron loss in the transformer, W_g the bulb loss, and W_s' the corrected output. The bulb output $W_2 = W_1' -$

in a high degree on the wave form. To gain more evidence an analysis was made of the anode-current and anode-voltage curves obtained with a contact-maker using the first-mentioned generator. As mentioned in

TABLE II—EFFECT OF FREQUENCY ON BULB LOSSES (G. SCHULZE)

I_m	I_{dyn}	Frequency	W_g	$W_g/I_m = e$
9.64	9.89	18	146.9	15.2
9.76	9.93	30	150.8	15.5
9.45	9.87	50	146.4	15.5
9.76	9.77	100	149.8	15.1
9.51	9.51	500	146.0	15.4

a previous paper, the bulb losses per anode relative to the wave amplitude may be represented by the formula: $W_g/2 = I_a E_0 + \Sigma I_k E_k/2 \cos \alpha_k$, where $K = 1, 2, 3$, etc. For a given anode current and voltage $W_g/2 = 411.3 + 65.8 - 539.2 + 7.7$. The conclusion to be drawn is that the second and third harmonics affect the bulb losses and efficiency considerably.

$W_c - W_i = W_g + W_s'$. W_i can be measured by wattmeters W_2' and W_2' , making the necessary corrections. The bulb losses are then determined directly by $W_g = W_2 - W_s'$, since both members of the second term are given by the wattmeters. See Fig. 2.

with constant primary voltage and normal frequency. From these curves it may be noted that for 900 watts

Still another test was made to sustain this conclusion. Three generators with the wave forms shown in Figs.

TABLE III—EFFECT¹¹ ON EFFICIENCY OF INCREASING LOAD WHILE VOLTAGE (110) AND FREQUENCY (50) ARE HELD CONSTANT

$W_1 - I_1^2 r$; $W_2' - I_2^2 r$; $W_3 + (P_3^2/r)$, and $W_4 + (P_4^2/r)$ are the corrected wattmeter readings; I_1, I_2 and I_3 were measured by dynamometers, and P_1, P_2 and P_3 with electrostatic (Kelvin) instruments. Since a pulsating current (I_2 and I_3) was flowing through the wattmeters, it might be expected that the readings would be influenced by the earth's magnetic flux, but it was found that the effect was very small (0.5 per cent). Neither did frequency have an appreciable effect on the wattmeter readings. η_1, η_2 and η_3 represent the transformer, bulb and rectifier efficiencies respectively.

output there is a difference in losses of about 7 per cent, despite the fact there is slight difference in the wave form.

This discovery led the writer to believe that the bulb losses, and therefore the efficiency, must be dependent

10, 11 and 12 were used, the bulb losses and bulb and rectifier efficiencies being determined (Figs. 8 and 9) at constant voltage (110) and normal frequency (50) in each case.

As a general observation it might be said that the efficiency of mercury-arc rectifiers is generally estimated

¹¹See footnote 1.

too high. It is easy to explain why an increase of bulb losses is to be expected if the impressed wave form is

FIG. 6—EFFECT OF WAVE FORM ON BULB LOSSES

(Dotted curve refers to losses with wave form represented by equation (2), while the full-line curve was obtained with the wave form indicated by equation (1). Voltage, 110; frequency, 60 cycles.)

FIG. 7—RELATION OF ANODE AND RECTIFIED CURRENTS TO OUTPUT FOR THREE DIFFERENT WAVE FORMS

FIGS. 10, 11 AND 12—THREE DIFFERENT WAVE FORMS EMPLOYED TO STUDY EFFECT ON RECTIFIER PERFORMANCE

different from the sine form, because for constant primary voltage the watts loss per anode is $W_g/2 = I_2^2 + BI_2$, where A and B are constants and I_2 the anode current.

In refutation of G. Schulze's conclusions that fre-

quency has no influence on the bulb losses the curves of Fig. 8 are presented. While the relations¹² represented have been questioned by some scientists, their opinions were based on investigations made with direct-current mercury arcs, whereas the data presented here refer

Massachusetts Institute of Technology in War

Many Forms of Service to the Nation Are Rendered—Training Technical Men for Land, Sea and Air Activity, Including Duties in Industrial Production

A number of universities are rendering conspicuous service to the nation. Boston "Tech" is especially fortunate in the fine technical organization which enables it to be of notable assistance in the war.

UNUSUALLY varied service is being rendered the United States government by the Massachusetts Institute of Technology in the war. This great engineering university is not only aiding through confidential research work and by the service of graduates under arms, but it is also carrying on an extended program of intensive training to prepare technically qualified men for war service on land, sea and in the air, including duties behind the lines and in communication, transportation and the production of munitions.

For eighteen months before the declaration of war an engineering corps, composed of seniors and instructors, gave time to the study of military engineering at the institute. At the moment war was declared President Maclaurin offered to the United States government the entire facilities of the institute, its faculties and laboratories, pointing out that the use of the latter by a staff familiar with them would be of the greatest advantage.

When war was declared a student committee was appointed to consider the situation and advise the undergraduates as to their most helpful course of action. This committee reported that undergraduates had better "sit tight" and that on graduation they would be worth more to the government than at the time war was declared or while remaining as students. Seniors were advised to seek places where technical men would be of advantage. Summer camps for military work were organized at East Machias, Me., and at Cambridge, Mass., the former, for sophomores, having an attendance of 200, lasting twelve weeks and having uniforms and military routine. The latter camp was for juniors, and in addition to the military work anticipated some of the senior study, to fit the men earlier for national service. The attendance was also 200.

By these means the institute, instead of being "shot to pieces" by the natural excitement and desire to enlist in the ranks, was held together, and last September at the registration nearly 90 per cent of the students were back in school ready again to take up their studies.

Speeding up of the regular courses was undertaken as soon as war was declared, although this development

in its highest degree is still under consideration. The vacation courses were to such an extent anticipatory of the senior work that qualified men in the 1918 class were ready for degrees about New Year's, early placing at the service of the government and of industries allied with the war a strong group of competent engineers, young, enthusiastic, well grounded in the fundamentals of engineering practice and not without knowledge of the bearing of such practice on modern war methods.

AN ALL-YEAR ENGINEERING COLLEGE

By recent faculty action the institute becomes an all-the-year-round school of engineering, and the lower classes will be advanced toward graduation, not only by the elimination of some of the less important items of study, but also by continuous work throughout the year. In this way the present juniors will be ready for degrees in the fall of 1918, anticipating the normal graduation by about nine months, while the second-year students will be similarly accelerated.

These undertakings on the part of the faculty to prepare enthusiastic students willing to work are based on the belief that the war is to last three or four years longer, and that the Technology student who leaves the institute at the end of his junior year to enter military work is but half an engineer in efficiency compared with what he would be at the end of the fourth-year courses.

At present there are about 2000 regular students in the institute. An advance battalion of senior classmen has been organized and put into khaki, more than 400 men being in the organization. A freshman battalion has also been put into uniform, and a four-year military option has been established in accordance with plans formulated just after war was declared, with the organization of two R. O. T. C. units.

In connection with the latter the institute courses were examined by a commission of army officers, whose report showed that with the addition of a small amount of special military work the graduates of the institute would be of a grade meriting commissions. There have recently been established two units, coast artillery and signal corps, open to sophomores, which will lead direct to commissions. It is hoped to establish two other units, ordnance and engineering, in the near future.

By this action the institute becomes a school parallel with West Point as far as the engineering attainments

are concerned, and equally with the latter a school for the development of material suitable for officers. The faculty has voted to admit freshmen this month, taking a picked group from the high schools graduating in January, who by studying during the summer vacation may overtake the men entering last fall.

On the declaration of war the entire group of students in the naval architecture course and some of the faculty went into the employ of the government or into shipyards. An intensive course in this specialty open to seniors was at once inaugurated, covering eight hours daily for eight weeks. Graduates went into government service and are now performing work of the utmost value in shipyards or in construction work at navy yards. A second intensive course in naval architecture was scheduled to begin on Feb. 4, with an estimated attendance of fifty men.

The faculty has volunteered gratuitous assistance to any seniors wishing to take military examinations by establishing "cram" courses leading up to such tests and many members of the staff have given free intensive instruction during the summer season for patriotic purposes.

OFFICERING THE NEW MERCHANT MARINE

For the United States Shipping Board, Prof. Edward F. Miller, head of the department of mechanical engineering, organized nine schools in principal ports of the United States to educate licensed land engineers in special studies for officering the engine rooms of the new merchant marine. Locomotive and stationary firemen also form the "raw material" of this work. Under the auspices of the institute no less than forty schools for deck officers for the merchant marine have been organized by Dean Burton.

There are now about 2500 "old salts" who have taken the course outlined by Professor Burton and are competent to navigate vessels on the ocean, and more than 1000 men prepared by Professor Miller's schools to care for the motive power of the vessels. Many of these men are already gaining their deep-sea experience in vessels on the Atlantic.

Two aviation schools, one each for the army and navy, have been established, and several hundred aviators have already been trained at Technology in the principles of ground work, bearing in mind in particular the fact that some eight men are required on the ground per flyer to keep the equipment in first-class condition for air service. The institute established the first course in aeronautical engineering in the United States.

Nearly 100 men are also taking an intensive course in a government school for naval inspectors of materials and construction of airplanes and motors, this course being repeated every six weeks.

Plans have also been completed to establish a course in radio engineering for students desiring to enter the United States Signal Corps, open to fourth-year men only. It is expected that the students will be enlisted in the signal corps and placed in Class 5 of the draft list as being in the service of the country. Fifteen weeks of twenty-eight hours each are planned, under the direction of Prof. A. E. Kennelly.

Few details can be published regarding the research work for the government proceeding under the direction of the institute staff, but an important and suc-

cessful poison-gas investigation has been carried out which appears to rob gas warfare of many of its dangers. It has also become possible to manufacture hydrogen gas in about one-tenth the space formerly necessary, and with correspondingly lighter apparatus—a point of great value in connection with balloon work.

In common with many other institutions, Technology has co-operated with the government in placing accurate and complete lists of its qualified alumni in the hands of Uncle Sam, under the title of "Who's Who in Tech Brains," the list now being in Washington and in the service of the government.

About 1600 Technology men are in military or naval service, including 117 officers in the United States Army. This is said to be more than from any other college. Twelve hundred are officers in training camps or elsewhere. Sixteen Technology men have already died in the service, and more than 2000 men are actively at work in industries allied to the war.

MASSACHUSETTS BOARD SEES STABILITY OF DIVIDENDS

No Occasion for Alarm as to Intrinsic Investment
Worth and Permanency of Reasonable Dividends
on Approved Shares

In the forthcoming annual report the Massachusetts Gas & Electric Light Commission expresses confidence as to the permanency of reasonable dividends and the intrinsic worth of shares of stock of gas and electric light companies approved by the board, saying:

As the war preparations of the government have progressed and difficulties of transportation, shortage of fuel and increased prices have developed, the vital relation of the gas and electric companies not only to the community but also to the industrial life of the commonwealth has become more clearly manifest than ever before. The necessity for conserving the capital as well as the natural fuel resources of the country has made evident the desirability of tying together the existing sources of power, both steam and water, and so co-ordinating their operation as to utilize all plants to their utmost capacity. Substantial steps in this direction have been taken upon the initiative of different companies involved. More may still be accomplished as necessity and a broader spirit of co-operation develop. In any event the present exigency has amply justified the encouragement given during the past ten years to the important hydroelectric developments supplying power to the industries of the Commonwealth.

The stimulated industrial activity of 1915 and 1916 encouraged many of the electric and certain of the gas companies to make substantial extensions of their plants. The declaration of war found them engaged in or committed to such undertakings, with floating debts representing capital expenditures which had not been permanently financed. The paramount claim of the government upon the financial resources of the nation, the steady increase in interest rates, the correspondingly steady decline in the selling price of gas and electric stocks, and the growth of a feeling of uncertainty and distrust with respect to all public service securities, have embarrassed such companies in making suitable provision for capital requirements. It is gratifying to note that while readjustments in prices and in operating conditions, due to exceptional costs beyond the companies' control and unusual demands for heat and power, have been necessary, yet net earnings have been on the whole well sustained, and no occasion exists for alarm on the part of individual holders of shares approved by the board as to the intrinsic worth of their investments and the favorable prospects for increased business and for the permanency of reasonable dividends.

A Study of Electric Range Efficiency*—II

Results Obtained by Means of Tests Made on Both Open and Inclosed Heating Units with Different Kinds of Utensils, as Well as from Experiments with Ovens of Different Size

BY R. G. KLOEFFLER

Assistant Professor in Electrical Engineering, Kansas State Agricultural College

The first installment of this article, printed in the Feb. 16 issue, dealt with the surface-heating units of the electric range. The study of the subject is concluded this week with a consideration of electric ovens.

SINCE the heat insulation of the oven is important, it is desirable to learn the amount of radiation from the oven. To do this a fixed input was given the oven until its internal temperature became constant. This test was made for inputs of 50, 150, 250, 500, 750 and 1000 watts, with current supplied by a storage battery and measured by a wattmeter. The temperature was measured by a carefully calibrated resistance thermometer near the center of the oven.

When the oven temperature became constant at 1000

Before comparing the radiation losses of the different ovens it should be carefully borne in mind that these tests were made on ovens of a large variety of sizes, which would affect their total radiation losses materially. Therefore, to make a more just comparison, the radiation of each oven has been reduced to watts per 1000 sq. in. (6450 sq. cm.) inside surface and watts per cubic foot contents, as plotted on the curves of Fig. 5. Table IV gives the exact measured inside dimensions of the ovens and the calculated inner surface area and cubical contents.

In the upper part of Fig. 4 the total radiation curves for all the ovens are plotted. These show, for instance, that at 450 deg. Fahr. (232.2 deg. C.)—a high baking

FIGS. 4 AND 5—RADIATION AND COOLING CURVES FOR ELECTRIC OVENS

watts input the circuit was opened, and the temperature was then read at time intervals, giving points for the cooling curve. The time and number of kilowatt-hours required to bring each oven successively to temperatures of 250, 300, 400, 450 and 500 deg. Fahr. (121.1, 148.9, 204.4, 232.2 and 260 deg. C.) was also measured, these being characteristic baking temperatures.

temperature—the radiation varies from 709 watts for large oven E to 258 watts for small oven H-S, while in Fig. 5 it will be observed that the difference in radiation for the same ovens is comparatively small when reduced to unit surface area. Fig. 5 (upper part) likewise shows that the radiation at 450 deg. Fahr. varies from 540 watts on small oven G to 280 watts on large oven H-L when reduced to watts per 1000 sq. in. (6450

*Copyright, 1918, by R. G. Kloeffler.

sq. cm.), whereas the total radiation of the same ovens shown in Fig. 4 does not differ widely. The ovens A, B, F and H-S and H-L all have radiation losses below 360 watts per 1000 sq. in., or 0.36 watt per square inch. These same four are the lower ones in previous Fig. 4, but the difference there is much greater since the size of oven was not taken into account.

In the lower part of Fig. 5 the radiation has been reduced to watts per cubic foot. Some have contended that this should be the proper basis for comparison, but this is not the opinion of the writer. As a proof of this contention it is pointed out that both H-S and H-L are in same range, are constructed similarly, and should have the same radiation per unit. The comparison by watts per 1000 sq. in. (6450 sq. cm.) shows this to be true, while the comparison per cubic foot places the radiation on H-S near the top and H-L at the bottom, which is not consistent. Both sets of curves agree that the radiation loss on oven G is very high.

FIG. 6—RATIO OF ENERGY CONSUMED TO OVEN TEMPERATURE

This oven has glass panels in the door, which permits a large heat radiation.

A comparison of the cooling curves is given in the lower part of Fig. 4. Here it might be expected that these curves would fall off in proportion to the amount of radiation as shown in curves of Fig. 5. This would follow if the ovens were of the same size, and does so approximately since ovens C and G, with largest radiation, fall off most rapidly and F, B, H-S and H-L, with smaller radiation, cool much more slowly.

From the analyses made above, it is evident that there is a large difference in the heat-retaining efficiency of the ovens. But judgment should not be based on this alone, since an oven which retains its heat longest may require more energy to heat it than another not so well insulated. This is brought out clearly in the curves of Fig. 6, which show the kilowatt-hours required to bring the various ovens to temperatures from 250 deg. to 500 deg. Fahr. A range of from 1035 kw.-hr. for large oven E to 330 kw.-hr. for small oven A was required to bring them to 450 deg.

It should be observed that the four ovens requiring the most energy to heat are the ones which retain their heat the best or really store it up. Hence for an opera-

tion which requires a short time, like baking biscuits, the oven which requires the fewest kilowatt-hours for preheating is obviously the best. Again, for the longer operations, such as baking bread or roasting, the heat-

TABLE IV—INSIDE DIMENSIONS AND CUBICAL CONTENTS OF OVENS

Range	Oven	Inside Area*	Cubical Contents†
A	18 in.x12½ in.x12½ in. (45.7 cm.x30.8 cm.x31.7 cm.)	1,250 8,060	1.71 44.7

H-S	10½ in.x11½ in.x13½ in. (26.3 cm.x29.2 cm.x33.6 cm.)	818 5,380	9.15 25.9

*In square inches and square centimeters.

†In cubic feet and cubic decimeters.

retaining oven with lower radiation losses may require less energy and give a more uniform temperature.

To get at this more concretely, a table has been prepared showing calculated kilowatt-hours required to keep the oven within the required range of temperature for a short operation (baking biscuits) requiring a hot oven, a one-hour operation (baking bread) and a two-hour operation (meat roast). Only the energy required to maintain the temperature is given, it being assumed that the heat would be the same in each case.

This table (V) has been prepared from the curves in Fig. 6 with the following assumptions as a basis. About 450 deg. Fahr. is required for baking biscuits and any oven will retain its heat a sufficient time for this operation after reaching 450 deg. Hence the number of kilowatt-hours required to heat it to 450 deg. is taken

TABLE V—KILOWATTS REQUIRED TO PREHEAT AND KEEP OVENS AT PROPER TEMPERATURE

Range Oven	Biscuits, 450 Deg. Fahr., Kw.-hr.	Bread, 400-300 Deg. Fahr., One Hour, Kw.-hr.	Roast, 400-250 Deg., Two Hours, Kw.-hr.	Cubical Contents in Terms of Oven E, per Cent
A	0.330	0.447	0.624	61
B	0.540	0.490	0.645	82
C	0.460	0.680	0.935	87.5
D	0.556	0.662	0.824	95
E	0.840	0.910	1.200	100
F	1.040	0.905	0.905	22.5
G	0.350	0.540	0.60	49.5
H-S	0.575	0.515	0.85	32.7
H-L	0.810	0.680	0.680	78.5

directly from Fig. 6. Bread will require about one hour to bake, and beginning with 400 deg. Fahr. the temperature may fall to 300 deg. Fig. 6 gives the watt-hours required to raise the temperature of the ovens to 400 deg. Then the cooling curve is consulted, and the

time during which energy must be applied to give an average temperature of 350 deg. is noted. From the radiation curve (Fig. 4) the necessary watts which must be supplied to maintain this temperature can be obtained, and this, multiplied by time and divided by 1000, gives additional kilowatt-hours. This value added to the initial kilowatt-hours gives the total energy required for baking bread. For making a roast a temperature range of from 400 deg. downward to 250 deg. in two hours is assumed, and the same system of computing as for bread is used. Two ovens remained within this temperature range for two hours.

The figures given are not asserted to be exact, but in-

dicative of results achieved under practical conditions.

Table V shows that ovens G and C with large radiation losses are more economical for making biscuits than H with low radiation losses. A and H-S, being small ovens, appear to be most economical for the average of three operations. The large ovens B and H-L show how the low radiation loss makes for economy in the long-period operations.

The advantage of cooking cereals, etc., in ovens as fireless cookers will show most favorably also in the oven having low radiation losses. The last column gives the size of each oven in percentage of the largest oven and will help the reader in making a fair comparison.

A. I. E. E. Convention Papers and Discussions

Abstracts of Principal Papers, Including Rating and Selection of Circuit Breakers, Substitutes for Standard Cells, Demand Meters and Dielectric Losses in Cables

EIGHT papers were presented before the mid-winter convention of the American Institute of Electrical Engineers in New York Feb. 15 and 16 that aroused considerable valuable discussion. They were as follows: "Rating and Selection of Oil Circuit Breakers," by E. M. Hewlett, J. M. Mahoney and G. A. Burnham; "A New Standard for Current and Potential," by C. T. Allcutt; "The Thermoelectric Standard Cell," by C. A. Hoxie; "The Character of the Thermal Storage Demand Meter," by P. M. Lincoln; "Measurement of Power Losses in Dielectrics of Three-Conductor High-Tension Cables," by F. M. Farmer; "Commutation in Alternating-Current Machinery," by Marius A. C. Latour; "The Secomor—A Kinematic Device Which Imitates the Performance of a Series-Wound Polyphase Commutator Motor," by V. Karapetoff, and "The Polyphase Shunt Motor," by C. K. Altes.

factors which are involved in the selection of circuit breakers for various systems.

While the r.m.s. current at any point of a system under short-circuit conditions is affected by numerous factors, practical approximate selection of circuit breakers, sufficiently accurate for many cases, can be made by using only reactance and an accepted group of time-current decrement curves, such as presented here. The curves are based on the following assumptions: Transient characteristics for alternators of normal design are determined from oscillograph tests; effect of capacitance and resistance is neglected; the contact resistance at short circuit is zero; the alternator is carrying full load 80 per cent power factor; the short circuit was established at the point of pressure wave corresponding to maximum possible instantaneous current, and no automatic voltage regulators are used. The curves are applicable for selecting circuit breakers for systems consisting of single or multiple machines with or without external reactance.

Rating and Selection of Oil Circuit Breakers

"On account of the variable conditions in systems on which circuit breakers are used, it is impossible to give a simple rule which will cover the selection of circuit

CURRENT DECREMENT CURVES FOR AVERAGE SYSTEMS

Ratio of system short-circuit current (r.m.s. amp.) to full load generator current at different intervals after circuit has been

opened. The reactance indicated on each curve is based on the total kva. rating of the generators.

breakers for all cases," say E. M. Hewlett, J. M. Mahoney and G. A. Burnham, joint authors of a paper on the above subject. The authors discuss the interpretations of the A. I. E. E. Standardization Rules covering rating of oil circuit breakers and consider the variable

To make use of the curves it is only necessary to determine the total reactance between the generators and the point of short circuit, remembering to convert the percentage of reactance in each case to a value corresponding to the total generator rating feeding into

the short circuit. After the total reactance and the time in seconds required for the circuit-breaker contacts to open are known it is possible to read the ratio of the r.m.s. short-circuit current to the full-load current directly from the accompanying curves. Several examples showing the applications of the curves are given in the original paper.

Unless the external reactance is very high, the use of automatic voltage regulators will increase the excitation after a short circuit so much that while the voltage may not be raised even to normal value, the sustained short-circuit current will be increased about 50 per cent. The authors conclude by expressing the belief that manufacturers of oil circuit breakers should publish information similar to that outlined in this paper not only to serve as a guide in the application of electrical protective devices but also to assist in bringing about a more uniform selection and a better understanding of the various expressions and methods used in connection with the rating of this class of equipment.

Discussion

The subject of selection and rating of oil circuit breakers aroused lively discussion, in which the following speakers took part: C. M. Hewlett, J. M. Mahoney, R. Summerhayes, W. W. Willard, Bassett Jones, C. C. Hanker, Philip Torchio, P. M. Lincoln, R. F. Doherty, F. L. Hunt, H. H. Dewey, H. D. James, M. L. Pollard, M. J. Neall, E. G. Merrick, C. H. Adams, H. C. Rushing, Jr., and G. A. Burnham.

Mr. Hewlett pointed out that the current-decrement curves shown in the paper were obtained from medium-size and small machines through the co-operation of manufacturers. Later tests will be made to check the accuracy of the curves for machines of higher ratings. He urged standardization of tests on circuit breakers.

Mr. Mahoney, commenting on the suitability of duty as a basis for comparing oil circuit breakers, expressed the belief that the A. I. E. E. specifications for duty are sufficient, as the duty imposed under actual operating conditions is usually less severe than that assumed in connection with the specifications.

Mr. Summerhayes elaborated on the effect of power factor on the rupturing capacity of oil circuit breakers. For instance, at 100 per cent power factor the current and voltage waves pass through zero at the same time, and it is easier for the oil circuit breaker to rupture the circuit than at lower power factors when the current and voltage are never zero at a time. With considerable reactance in the circuits oscillations may be set up which cause transient conditions that are difficult to determine. When resistance predominates switch duty is less severe.

Mr. Willard pointed out that the curves presented in the paper by Hewlett, Mahoney and Burnham cover cases in which all legs of a polyphase circuit are involved, as well as the grounding of one phase. It is possible, he added, that the curves will also cover cases where one leg is grounded, provided only one of the generators in multiple is grounded. Attention is also called to the necessity of considering cases where the grounds occur on the generator side of the transformers as exceptional and not covered by the curves.

Mr. Jones emphasized the need of information which would facilitate the selecting of oil circuit breakers from a variety of different makes. There is no necessity, he pointed out, of having a different type of circuit

breaker for every condition, if reinforcing parts are available which can be applied to a few standard makes of oil circuit breakers. By thus making a few types suitable for all conditions, manufacturers would be able to simplify their stock by carrying fewer types of oil circuit breakers, and the users of switches could modify circuit breakers as operating conditions changed by reinforcing the parts.

Mr. Torchio said that no circuit breakers have been found capable of opening short circuits in the proximity of New York generating stations without reactors. He trusted that developments will bring out such a switch. One of the greatest difficulties in selecting oil circuit breakers, he pointed out, is in judging future requirements. Systems change so rapidly that unless a large enough circuit breaker is installed in the beginning substitution of larger units may have to be made too often or reactors will have to be provided to supplement the switch which met former operating requirements but is too small, alone, for present conditions. Large circuit breakers are usually more economical than small units used in conjunction with reactors, but on industrial circuits where proper attention cannot be given to the switches it may be better to use simple switches with reactors.

Mr. Lincoln pointed out the necessity of expressing reactance ratings in terms of current as well as voltage, since a reactor which will have a certain effect with one current will have a different effect with another current. The difficulty which manufacturers have in rating circuit breakers is due to the inability to test them under the user's conditions. Therefore close co-operation between manufacturer and user is necessary if the proper development in circuit-breaker information and construction is to be expected.

Mr. Doherty pointed out that in old machines—that is, those designed several years ago—the sustained short-circuit current is larger than in recently designed machines; therefore the curves given in the paper should be modified accordingly.

Mr. Hunt, in calling attention to the necessity of a more definite method of rating of circuit breakers to permit comparison, suggested that manufacturers give curves showing the effect of different factors on the performance.

Mr. Dewey said that so far circuit breakers have been made which are capable of rupturing 500,000 kva. The development of larger circuit breakers is not so important, the speaker believed, since it is doubtful whether circuit-breaker rating will limit the size of electric systems. It is more likely that damage to buses, etc., on peak values of the short-circuit current will be the limit.

Mr. James called attention to the fact that the impedance of transformers will limit the short-circuit current drawn by motors. Selective operation of oil switches—that is, automatically opening branch-circuit, feeder and generator switches in the order named—will help considerably in solving the oil circuit breaker problem.

Mr. Pollard contended that while the information presented in the paper may help in certain cases in deciding the maximum r.m.s. current which may exist, it does not help in the selection of circuit breakers of different makes. Since further investigation along this line would be of interest to operating engineers, he

suggested the formation of a committee composed of operating engineers and manufacturers to specify standards of comparison. This need was emphasized by Mr. Adams. Mr. Pollard also urged marking current and voltage on all circuit-breaker name plates.

Mr. Neall said that in drafting specifications distinction should be made between the duty which will demolish a circuit breaker and that which will only unfit it mechanically for continued operation. He expressed the belief that the A. I. E. E. should specify what percentage of maximum rating should be allowed in circuit breakers.

Mr. Merrick said that the momentary short-circuit currents for single-phase and three-phase shorts do not differ considerably, but that the sustained single-phase short-circuit current may be 30 to 50 per cent greater than a three-phase short-circuit value, depending on whether a definite-pole machine is used or not. With a definite-pole machine the single-phase short-circuit value obtained with a leg-to-leg short circuit may be 75 per cent greater than with a three-phase short circuit.

There are three duties for an oil circuit breaker to perform, said Mr. Cushing. They are to disconnect a circuit, to carry current and open under abnormal conditions. Therefore, in stating the performance of circuit breakers, it should be pointed out what they can do besides opening under abnormal conditions.

Mr. Mahoney pointed out that it is the expulsion of oil that really limits the duty of an oil circuit breaker, as after a certain number of operations enough oil may be expelled to make extinction of the arc difficult. Furthermore, arcing tips may be consumed, hence it is not desirable to operate without inspection after a certain number of operations.

In closing the discussion on the paper, Mr. Burnham said that standardization of oil circuit-breaker ratings would be very welcome to manufacturers, but at the present time there is no apparatus, to his knowledge, which can be used to determine the effect of factors affecting the short-circuit current on the rupturing capacity of oil circuit breakers. While old catalogs issued by manufacturers of oil circuit breakers may not have been of much assistance to users in selecting the type of equipment used, he expressed the belief that most new catalogs will be serviceable, as they will list the operating and tripping time of the mechanism used with the circuit breakers. Special emphasis was laid upon the necessity of close co-operation between users and manufacturers.

Substitutes Suggested for Standard Cells

Chester T. Allcutt described a new secondary standard which is proposed as a substitute for the standard cell in certain classes of direct-current measurements. The device consists of a Wheatstone bridge which will balance for but one value of current. Various factors affecting the accuracy and permanence of the devices are discussed, and a number of curves are given showing the characteristics which have been obtained. The work done in connection with the development of this new standard has demonstrated that it can be relied upon to maintain an accuracy of 0.1 per cent.

A means of obtaining a secondary standard of emf. by utilizing the emf. of a thermocouple was described

by C. A. Hoxie in a paper following Mr. Allcutt's. The method consists in balancing the potential across a resistance against the thermoelectric emf. of the thermocouple. This requires a definite value of current through a filament which is used as a source of heat for the thermocouple. The construction of the cell is discussed in detail, particularly the use of gas in the bulb. The results of permanency tests on a number of cells are shown.

Discussion

In the discussion of the preceding subjects it was brought out by several speakers that while the war has made it exceedingly difficult to secure standard cells there is no necessity of using high-precision cells for some kinds of potentiometry. Among those taking part in the discussion were Dr. C. H. Sharp, F. C. Stockwell, Dr. E. E. F. Creighton, Dr. P. G. Agnew and the authors of the two papers.

Dr. Sharp described an inexpensive, easily made and convenient standard cell which is being used in the Electrical Testing Laboratories on work not requiring high precision. To secure standard alternating-current or direct-current voltages it is convenient to use a bridge made up entirely of incandescent lamps which will balance on only one voltage.

Mr. Stockwell expressed the belief that the two methods described in the preceding papers fall short of replacing the primary standard cells in simplicity, convenience, accuracy and permanency. He also questioned the value of substituting primary cells, as modified cadmium cells can be made very cheaply—for about \$3 apiece—and will last about three years. When aged they have almost the accuracy of the primary standard cell.

Dr. Creighton expressed the belief that the value of two substitutes for primary standard cells described in the preceding papers is in connection with alternating current. These cells have been used with frequencies of 100,000 cycles per second.

Dr. Agnew pointed out that the accuracy of the unsaturated type of Weston cell can be made very high by preparing the mercurous sulphate with alternating current. In this connection, he pointed out, the emf. depends upon the frequency used in the preparation of the compound.

Demand Meter That Operates on Thermal-Storage Principle

After giving a detailed description of the principle and construction of the thermal-storage demand meter, P. M. Lincoln showed why it will always indicate what may be called the logarithmic average rather than the arithmetic average of power consumption heretofore indicated by practically all demand meters. The inherent faults of the arithmetic-average or block-interval meter are described and examples given demonstrating that the thermal-storage meter alone recognizes the true heating effect that fixes size of equipment and, therefore, the cost that should be assessed against the customer. The thermal storage-demand meter gives a much higher indication for a very short-time peak-load application than does the block-interval demand meter, thereby making unnecessary the adoption of short demand periods designed to penalize such high peak loads.

Discussion

The suitability of the readings given by thermal-storage demand meters in determining the primary charge assessable to consumers constituted the chief subject of discussion in connection with the preceding paper. Among the speakers taking part in the discussion were the following: C. R. Hall, G. W. Magalhaes, G. L. Hoxie, M. G. Lloyd, A. S. Albright, H. D. James, H. L. Wallau and the author of the paper.

Mr. Hall compared the indications of the Wright, the thermal-storage wattmeter and the thermal-storage ammeter types of demand meters, expressing the belief that the readings given by the latter type more nearly represent the heating effect on the equipment serving a consumer.

Mr. Magalhaes did not favor the standardization of the maximum-demand period, saying that local conditions should fix this value.

Mr. Hoxie expressed the belief that the consumer's maximum demand, which is coincident with the station peak, is the value which should be taken into account in fixing the primary charge, as it is this value which determines the amount of generating equipment which must be kept in reserve to serve a consumer.

Dr. Lloyd agreed that the readings given by a thermal-storage demand meter closely approximate the heating effect produced in a generator supplying a load, when only one consumer is being served, but that under actual operating conditions, where the loads of several consumers are superposed, the diversity causes the maximum system demand to be less than the sum of the maximum demands of the individual consumers. Hence the consumer's maximum demand is not an indication of the amount of the equipment which must be kept in reserve to serve him.

Mr. James pointed out that the chief value of the thermal-storage principle is in indicating the heating effect on individual pieces of apparatus such as motors. Thermal-storage ammeters are particularly valuable in indicating when an intermittent load is overheating a motor.

In closing the discussion Mr. Lincoln contended that heating of electrical apparatus is due to voltage as well as current, therefore a thermal-storage wattmeter type of demand meter should more closely represent heating of the apparatus serving a consumer than an ammeter type of demand meter. Referring to Mr. Hoxie's remark, he said that the distribution expense is relatively larger than the generation expense per consumer, so maximum demand as indicated by the consumer's meter does represent the portion of the total overhead charge which should be assessed against the consumer in the form of a primary charge.

Measuring Dielectric Loss in Three-Conductor Cables

In a paper entitled "Measurement of Power Loss in Dielectrics of Three-Conductor High-Tension Cables" F. M. Farmer described a method used at the Electrical Testing Laboratories for measuring the dielectric power losses in 10-ft. (3.04-m.) samples of three-conductor cables with three-phase potential applied to the cable. Methods of overcoming the difficulties encountered are discussed in considerable detail.

Among the conclusions drawn are the following: The power loss in the dielectric in a three-conductor cable can be readily measured under actual three-phase conditions in the laboratory with specimens 10 ft. (3.04 m.) long; no special apparatus is necessary other than a reflecting high-sensitivity wattmeter; apparently the power loss in the dielectric cannot in all cases be accurately calculated from data obtained in single-phase tests, although it is highly probable that for all practical purposes the discrepancy would not be serious.

Discussion

Reference to dielectric loss tests abroad and in this country, different methods of making the tests, cause of difference between losses as obtained by single-phase and three-phase tests, standardization of tests, limitation of dielectric losses by specifications, precautions necessary in tests, and advisability of testing dielectric losses after cable has been in service were the chief subjects discussed in connection with this paper. Among those taking part were H. W. Fisher, R. W. Atkinson, C. W. Davis, Mr. De Bois, John L. Harper, W. H. Cole, L. L. Elden, Philip Torchio, L. T. Robinson, F. W. Peek, Jr.; Dr. M. G. Lloyd, J. R. Craighead and Prof. C. A. Adams.

Mr. Davis referred to the electrometer, electrody-nometer and bridge methods of testing dielectric losses, saying that each had been used by his company.

In trying to account for the difference between loss readings obtained by making single-phase and three-phase tests, Mr. De Bois referred to the shifting of the neutral plane due to phase rotation as possibly affecting the losses. Naturally the center of the cable is hottest, but not necessarily owing to greater stresses. The reason why cables break down in the center more than elsewhere is because the dielectric losses are cumulatively increased by the high temperature existing.

Mr. Cole pointed to the possibility of carrying capacity of cables being limited by part of the dielectric changing in such a manner that other parts are overstressed.

Mr. Torchio showed curves indicating the effect of wave form on the dielectric losses, and urged reducing losses to capacitance and resistivity per unit of volume.

Mr. Robinson pointed out that correction for the phase-angle distortion of a potential transformer can be eliminated by applying a compensating load which can be measured.

Mr. Peek called attention to the advisability of measuring dielectric losses in cables after they have been in service, as the insulating compound may migrate.

In offering a clue to the difference in losses as obtained by single-phase and three-phase tests, Dr. Lloyd pointed out that the dielectric may be stressed differently in the two cases, that the insulation is not homogeneous, that the loss due to an alternating field may be different from that due to a rotating field, etc. Along this same line Professor Adams emphasized the non-homogeneity of cable insulation, and the different effects of single-phase and three-phase currents on the temperature, the losses per unit volume, the specific resistivity and on the flux distribution.

OTHER PAPERS AND DISCUSSIONS

Abstracts of the three remaining papers will be found under "Technical Theory and Practice," on page 420 of this issue of the ELECTRICAL WORLD.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

FIREPROOF COMPARTMENTS FOR TRANSFORMER UNITS

Each Cell Opens Directly Out of Doors—Steel Curtains Provide for Removal or Protection Against Weather as Required

The accompanying illustration shows the provision of fireproof compartments for transformer units which is one of the particular features of a new substation of the Edison Electric Illuminating Company of Brockton, Mass., marking an advance over practice in many older

THIS TYPE OF CONSTRUCTION FOR HOUSING TRANSFORMER UNITS REDUCES FIRE HAZARD MATERIALLY

installations. A separate cell is built for each of the main transformers, each cell opening directly out of doors. Metal roller curtains provide for protection against weather or removal, as the occasion requires. Each transformer is mounted on a reinforced-concrete track, the outer ends of the rails or beams terminating in a concrete sill in which a rectangular slot is left for oil drainage. Adjacent transformers are separated by fire walls through which the necessary connecting leads pass.

ADVANTAGES AND METHOD OF INTERLOCKING MOTORS

Motors Should Be Interlocked When Driving Cutting Machinery Where the Rate of Material Feed Varies

BY DAVID R. SHEARER

In a great many manufacturing operations it is frequently found advisable to drive a given machine by more than one motor. That is, the machine may require more than one motor in order that the different operations of the machine may be changed with respect to other operations of the same mechanism. This is true particularly with cutting machinery, where the rate of material feed should be adjustable in order to handle various sizes of stock. As examples of machinery in which this characteristic is necessary, planers, wood saws, diamond marble saws, sizers and other

tools in which the cutting is practically constant but the feed variable may be mentioned.

As long as the cutting motor and the motor operating the variable feed are both running, the entire machine operates satisfactorily, but should the cutting motor blow a fuse, trip its relay or be stopped by the operator and the feeding motor continue to run, serious trouble is liable to follow. The feed will force material against the powerless cutters and either bend or break parts of the equipment. Most feeds operate rather slowly by being geared down many times from the motor shaft, so that the feed motor, though very small, may have enormous power on the slow-moving rolls or carriage handling the material.

Trouble can be obviated easily on any machine operating under power from two or more motors by interlocking the no-voltage-release coils on the starters or compensators. The accompanying illustration indicates a driving and a feed motor operating in an interlocking manner on three-phase alternating current. It will be noticed that current is taken from the driving motor leads through both release coils and both relay trips on the two compensators. Thus, if the cutting or drive motor is stopped or fails, the current is broken in the release coil of the other machine and it stops also. Moreover, if either motor becomes overloaded sufficiently to trip the relays the entire set is at once brought to a stop.

By the addition of a double-throw switch the coil-operating current may be taken from the leads of either

DRIVING AND FEED MOTOR OF CUTTING MACHINERY INTERLOCKED TO INSURE SIMULTANEOUS OPERATION

motor as desired. This is sometimes advisable when it is necessary to operate one of the motors singly for some specific purpose. This method of interlocking may be extended to cover several motors operating interdependent mechanism, and the actual arrangement of connections may be subject to many changes; but the principle remains the same.

ELECTRIC SUCTION DREDGE FOR CONDENSER INTAKE

Rock-Filled Jetties Built to Help Clear Canal of Silt—Details and Cost of Electrically Driven Dredge

The San Diego Consolidated Gas & Electric Company has used with success for a number of years an electrically driven suction dredge for keeping clear the channel in the bay from the condenser intake to deep water. The main intake of the company's steam plant consists of a double concrete tunnel 800 ft. (243.8 m.) long. The lower or intake tunnel is 6 ft. by 3 ft. 9 in. (1.8 m. by 1.1 m.) at the intake chamber and 6 ft. by 4 ft. 9 in. (1.8 m. by 1.4 m.) at the power house. The discharge tunnel is 6 ft. by 6 ft. (1.8 m. by 1.8 m.). The intake chamber is 23 ft. by 20 ft. (7 m. by 6.1 m.). The intake chamber is situated on San Diego Bay near the foot of Ninth Street. From the intake chamber a canal was dredged, perpendicular to the shore line at this point, in a southwesterly direction. This dredged canal is about 800 ft. (243.8 m.) long and reaches to a deeper part of the bay. Owing to the silting up of the canal

ENERGY FOR DRIVING MOTOR SERVED THROUGH CABLE CONNECTED TO NEAREST POLE

with mud and débris it was necessary to dredge frequently in order to obtain sufficient circulating water at extreme low tide. For this purpose an electric suction dredge was constructed and was used with good effect several times a year. More recently the company has lined the sides of the canal with a pair of rock-filled jetties which carry the intake out to the United States government bulkhead line. The center lines of the jetties are 54.2 ft. (16.5 m.) apart.

WHAT EXPERIENCE WITH THE DREDGE HAS SHOWN

Since the jetties were installed the canal silts up far less rapidly than before, little silt being carried in from the sides; for although the tops of the jetties are below extreme high tide, it was only at low tide that much silt and débris was formerly carried sideways into the canal. Not only has the installation of jetties reduced the frequency and cost of dredging, but as the discharge water cannot flow back into the intake canal at low tide, lower temperatures of circulating water are obtained and plant efficiency is consequently improved. Likewise the water is cleaner, thus reducing the expense of cleaning intake screens and condenser tubes. The jetties are now used as a dumping ground for waste brick and similar scrap from about the plant and are in consequence gradually being increased in height.

At present it is necessary to dredge the canal annually. This is usually done just before the extreme low tides of the fall. The barge used for the dredge is a 15-ton lighter, 10 ft. (3 m.) wide by 31 ft. (9.4 m.) long. The pump is a United Iron Works 6-in. (15.2-cm.) centrifugal sand and gravel pump with renewable brass wearing rings in the hubs and with shaft covered with brass tubing. The pump is direct-connected to a 35-hp., 220-volt, three-phase, 60-cycle, 600-r.p.m. induction motor. The dredge is equipped with a house to cover motor and pump and with booms for handling suction and discharge lines. The mooring lines are handled by means of midget windlasses. The suction pipe is 6-in. (15.2-cm.) wrought iron; the discharge pipe a piece of 7-in. (17.7-cm.) pipe, 24 ft. (7.3 m.) long, made of No. 16 galvanized iron, light weight being desirable at this point. No cutter is used. The suction pipe is lowered until it rests on the bottom, and as the dredge is warped lengthwise along the canal a good cut is made in the soft mud and gravel.

The dredge is served by means of a line of 40-ft. (12.2-m.) poles bolted to piles driven just outside of one of the jetties. A three-wire cable carries 220-volt, three-phase energy from the nearest pole to the dredge. The poles also serve to carry lamps for the illumination of the jetties and the protection of small boats in the bay.

The cost of the dredge was as follows:

Lighter	\$150
Pump	390
Motor	440
Booms, piping and housing.....	120
Tools and equipment.....	155
Wiring	35
Labor	160
Total.....	\$1,450

At present prices the cost of a similar dredge would of course be considerably greater.

UNINTERRUPTED PRODUCTION VERSUS CIRCUIT PROTECTION

Circuit Breaker Is Adjusted Near to the Current Capacity of Circuit and Fuse of Much Greater Capacity Used for Short-Circuit Dangers

BY E. C. PARHAM

When a fuse of low enough capacity to protect apparatus from the effects of ordinary overloads is used, frequently recurring violent fluctuations of current will blow the fuse so often as to interfere seriously with the production of the motor that the fuse is used for protecting. If a larger fuse is used the circuit may be damaged. With a circuit breaker it is much more practicable to adjust to the safe continuous-current capacity of the circuit because the very short time required for resetting a breaker does not seriously affect production. Owing to the general neglect of circuit breakers, however, and to the common but reprehensible practice of abusing their adjustment, it is a wise precaution to include in the circuit a fuse that can be depended on to act under short-circuit conditions should the circuit breaker fail to do so. That circuit breakers can be criminally abused is illustrated by the following experience:

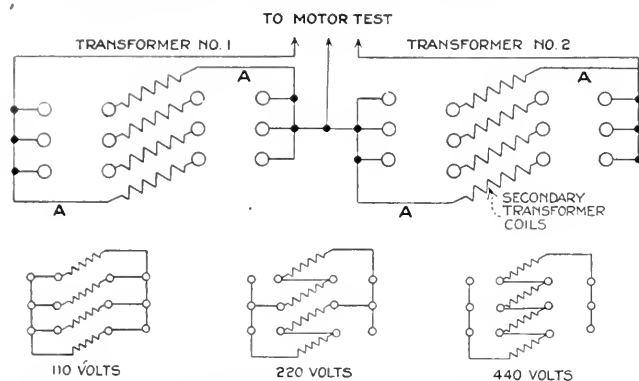

The output of a certain station generator was passed through a double-pole circuit breaker that was con-

needed in series with fuses. As the demand on the station increased another generator was installed, and further increase of load made it necessary to screw up the circuit-breaker adjustment because frequent blowing of the breaker was interfering with the service. Then the fuses began to blow and heavier fuses were installed. Meanwhile the breaker parts were turning blue from heating. To relieve this condition the operator connected a switch in parallel with the breaker and the switch parts immediately began to discolor. Finally the breaker exploded.

SWITCHING ARRANGEMENT FOR TESTING MOTORS

Installation Includes a Pair of Transformers Having 110-220-440 Volt Secondaries and Single-Throw, Single-Pole Switches

The arrangement of switches shown in the accompanying figure will be found useful in motor repair shops for testing purposes. By means of this arrangement single or three-phase 110, 220 or 440-volt energy

A SWITCH ARRANGEMENT THAT WILL BE FOUND USEFUL FOR TESTING MOTORS IN REPAIR SHOPS

may be tapped from a pair of transformers connected in open delta, merely by switch operation, thus saving considerable time in changing connections to suit the various motors under test.

The installation requires a pair of transformers having 110-220-440-volt secondaries. Such transformers are sometimes constructed with eight secondary leads, sometimes with only four. In the latter case four special leads must be brought out, as it is necessary to have access to both terminals of each of the four secondary coils. The extra leads can be readily brought through porcelain bushings placed in holes drilled in the transformer covers.

It will be noted that the full capacities of the transformers are utilized at the standard voltages. In addition, a variety of single-phase voltages are obtainable across the outside leads for special testing by connecting the two transformers for different voltages.

This switching combination is not foolproof. Either transformer may be short-circuited by incorrect connections, but the arrangement is so simple that any tester soon becomes accustomed to it.

Standard single-pole, single-throw knife switches are installed, but half of the switches are used double-throw. If the handles of the switches which are used double-throw strike the bases of the others, the handles may be offset to clear laterally. The installation may

be somewhat improved by the insertion of additional single-pole switches at points A, although these are not absolutely essential.

THE PROPER INSTALLATION OF STRAIN INSULATORS IN GUYS

Results of and Conclusions Drawn from Tests Made on the Proper Placing of Clamps Adjacent to Insulators

In making up strain insulators in guys, particularly where large insulators and three bolt guy clamps are used, care must be taken to place the clamps close to the insulators if the full strength of the guy cable is to be developed. A number of samples were recently made by a Western company and tested for tensile strength. The edges of the clamps were set about 3 in. (7.6 cm.) from the end of the insulator, as appeared to be customary with the linemen making up the samples. It was found that in every case slippage occurred at from one-half to three-quarters of the full strength of the guy, first one clamp and then the other slipping down to within 1 in. to $\frac{3}{4}$ in. (2.54 cm. to 1.9 cm.) of the face of the insulator, after which each would hold and the sample would develop the full strength of the guy cable.

In the accompanying illustration (upper) a sample is shown under test after one clamp has slipped but before the other had let go. In this particular sample slipping began at 3300 lb. (1496 kg.), and the strand—5/16-in. (8-mm.) seven-strand standard steel—finally broke, after the second clamp had slipped up, at 4400 lb. (1996 kg.). The same results were indicated with lighter guys and insulators made by wrapping without the use of clamps. A good specification covering this point is to make sure that the space between the insulator and the clamp (or wrapped splice if used) does not exceed 1 in. (2.54 cm.).

With respect to the relative values of three-bolt

CLAMP ON RIGHT HAS SLIPPED; SPLICED-IN INSULATOR AFTER BOTH SPLICES HAD SLIPPED

clamps as compared with wrapped splices, the tests indicated that the use of clamps increased the ultimate strength from 15 to 20 per cent, although in all cases the samples, whether made up with or without clamps, exceeded the rating of the steel cables. The lower illustration shows a spliced-in insulator after both splices had slipped.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

CENTRAL STATIONS FIND WAYS TO SELL THRIFT STAMPS

Efforts Are Made Successfully to Interest Customers
and Employees in Small Savings for
the Government Use

Interesting details are coming in of the success which central stations throughout the entire country are having in the sale of war saving stamps. Public utilities have been particularly invited by the government to become authorized agents for the sale of these thrift stamps and war saving stamps and have responded with enthusiasm. Most of the large holding companies have sent out a call to all their properties to line up in the movement and, with the independent companies, have been enrolled direct from Washington. Many ingenious methods are being employed in promoting the sales. For instance:

WHAT THE CASHIER CAN DO TO HELP

In the office of the Colorado Springs Light, Heat & Power Company—and this idea is now being generally employed—whenever a customer pays a bill at the cashier's window and the change he is to receive is 25 cents or more the cashier suggests that he receive a thrift stamp in place of the 25-cent piece. War saving stamp posters are conspicuous in the office, and the cashier on the floor endeavors to interest every customer who comes in in the purchase of war saving stamps as well as appliances.

The Massillon (Ohio) Electric & Gas Company has made a feature of a large "W. S. S." banner which has been hung in front of the office window. In the early days of the campaign there were a great many inquiries as to the meaning of the initials, and members of the new-business department saw to it that this reacted in the purchase of thrift or war saving stamps. The Massillon company gave each of its employees a partly filled thrift-stamp book as a Christmas gift, and this has been done by many other companies at Christmas time.

The Danbury & Bethel Gas & Electric Light Company contributes a Christmas bonus each year to its employees and last Christmas paid the money in thrift stamps.

The Salina (Kan.) Light, Power & Gas Company has made a practice of presenting some small heating appliance to its employees as a Christmas gift. This year it was a war saving stamp or thrift stamps instead.

In Bloomington, Ill., the Union Gas & Electric Company acted so promptly that it was the first authorized agent for the sale of war saving stamps in the community except, of course, the post office. This was commented on extensively by the local newspapers and produced considerable local publicity not only for the company but for the war saving stamps.

The New Orleans Railway & Light Company organized a special campaign for the sale of war saving

stamps for its employees. They designed an elaborate window display as a central feature, and prizes were given to the employees selling the most stamps.

The Montgomery (Ala.) Light & Water Power Company has featured a special advertising campaign to push the sale of war stamps in the name of the company and has developed a large sale for these stamps. It has made the slogan of its campaign, "Ask for your change in thrift stamps. A quarter to Uncle Sam means no quarter to the Kaiser."

The Toledo (Ohio) Railway & Light Company, in addition to carrying "W. S. S." posters both inside and outside the street cars and placing them on sale in the office, carhouses, shops and power houses, has stocked each representative of the new-business department with war saving stamps to be sold to present and prospective customers on whom he calls.

The Empire District Electric Company of Joplin has introduced another innovation by offering a thrift card with \$1 worth of stamps as a premium to any one who purchases an electric washing machine, a vacuum cleaner or a sewing-machine motor.

One of the most interesting ideas for selling the stamps has been originated by the Manhattan & Queens Traction Company, which operates in New York City, and it will be of interest to central stations operating railway lines. This company has placed thrift stamps on sale in every one of its street cars. Posters are displayed inside the car, and passengers are requested to take their change in stamps wherever the amount is large enough. This has produced a surprising number of sales.

MAKING IT EASY TO POCKET THE STAMPS

In the New York office of the Henry L. Doherty Company impetus has been given to the purchase of war saving stamps by employees by discontinuing the distribution of salary checks and having every employee call at a special window for his check. Here an attractive young woman undertakes to induce every employee to buy at least one thrift stamp, and her efforts meet with much success. At the war saving stamp window in the Doherty office it has been found of great assistance in the sale of stamps to have on hand small square sheets of oiled paper for wrapping up the stamps and little envelopes in which to inclose them. Many a man will hesitate to buy one stamp because he has no place to put it. His thrift card may be at home, and if he puts a loose stamp in his pocket it is liable to be damaged.

The spirit in which the central-station industry is supporting the government in this campaign is undoubtedly developing a large additional market for war saving stamps, and with every member of the organization from the office boy up enlisted in the work it will render increasing service in the effort to raise two billion dollars for the war in this way.

ANOTHER COMPANY STOPS FREE DELIVERY OF LAMPS

Outlying Lamp Service Stations Are Installed and
35-Cent Delivery Charge Is Established
in Chicago

The Commonwealth Edison Company of Chicago, which includes free lamp renewal as a part of its service, stopped gratuitous distribution of the lamps on Jan. 15. At the customers' requests lamps were formerly delivered free of charge anywhere in the city. Under the present arrangement when a customer calls at the lamp service bureau the clerk states that the company has, for the convenience of its customers, established lamp service stations in various parts of the city and gives the person who calls the address of the nearest station. The customer is also told that there is a complete stock of lamps at this station and that an attendant there will help him select the proper sizes of lamps. For those who do not wish to call at the stations for lamps the company still maintains a delivery service, for which it charges 35 cents per call.

The lamp renewal stations, of which the company now has twelve, usually occupy space in stores that are already established. This number of stations will probably need to be increased. In selecting these stores it was suggested that real-estate agencies might be desirable concerns to carry the lamps, since they have to maintain stores and have nothing in the way of stock to occupy their windows. On reconsideration, however, it was decided that the most desirable locations for the lamp renewal stores were places of business which had something to gain by having electric service customers call for lamps. The twelve agencies are located as follows: One printer's store, one electric fixture store, one building formerly vacant, three hardware stores, two drug stores and four buildings already partly occupied by the company. This arrangement gives one store to each zone of 2½ miles to 3 miles (4 km. to 4.8 km.) in the city.

An analysis of 1000 calls for lamps made just after the new system was installed showed that about 10 per cent of the customers would rather pay the 35 cents charge than call for lamps in person. This ratio is expected to decrease, however, as familiarity with the system increases.

PATRIOTIC ACTIVITIES OF CENTRAL STATIONS

Carrying Out a Vigorous Policy in Patriotic, Civic
and Other Public Enterprises Is Con-
sidered Important

H. H. Harrison, president of the Merchants' Heat & Light Company, Indianapolis, Ind., is firmly of the belief that "the public utility which serves its public serves itself." This motto, it is thought, applies in time of war as well as peace. In consequence the Merchants' company has been particularly active since war was declared in conducting such patriotic and civic activities as deserved support under the circumstances. Its efforts in soliciting Christmas presents for the French children in co-operation with the French Relief resulted in 18,000 presents being sent to France. Of late the company has been engaged in promoting food conservation and in fostering a movement for sending comic valentines to

American soldiers in France. The latter endeavor had a twofold purpose. The valentines were from the works of Indiana's best caricaturists and authors and will certainly bring smiles to the faces of Hoosier soldiers who receive them. Then, too, the proceeds of

FIG. 1—WINDOWS CONTRASTING AMERICAN AND FRENCH CHILDREN'S CHRISTMAS TO AID RELIEF WORK

the sale of valentines go to the French Relief. The show windows of the Merchants' company office and store, being on the most prominent corner in Indianapolis, have formed a valuable asset in advertising these

FIG. 2—CENTRAL-STATION WINDOW THAT SELLS VALENTINES TO ENTERTAIN SOLDIERS AND PROVIDE RELIEF

campaigns. Some of them are shown herewith. The company's motograph sign on top of the building was considered so valuable in advertising this sort of work that it was especially exempted from all lightless night orders by the local fuel administrator.

KEEPING IN TOUCH WITH OPINION OF CUSTOMERS

Method Designed by Syndicate to Prevent Unfavorable Public Impression from Gaining Headway in Communities Served

One of the big problems of companies serving a number of communities is that of knowing definitely the opinion of the communities toward the company. The general headquarters containing the office are as a rule not in the small towns, but rather in some large

YOUR SUGGESTION BOX

BUSINESS resolves itself into a matter of dealing with friends.

"A FRIEND," says Emerson, "is a person with whom I may be SINCERE."

WE WANT YOU to be perfectly sincere with us, just as we aim to be perfectly sincere with you. To keep pace with the growing needs of this community, we must come into close relations with you—we must know *your* requirements, *your* opinions, *your* wants.

WE THEREFORE INVITE your frank recommendations and criticism.

IF YOU HAVE any suggestions for the further upbuilding of our service, or if you have any report to make whatsoever—whether in the way of claim, complaint or commendation you will be *doing us a favor* if you will pass it on in writing over your signature.

TO MAKE THIS EASY as well as confidential for you, we are posting a Suggestion Box in the local office. We ask you to make frequent use of this "Special Delivery" service, and to accept in advance our assurance of careful and courteous attention to your communications.

ONLY THE OFFICERS of the Company will have access to this box, which is to be opened by them periodically, on the occasion of their visits to this station.

LET US HAVE YOUR CO-OPERATION in making this new plan bear good fruit for you and us alike.

INDIANA
POWER & WATER CO.

SUGGESTIONS DIRECTLY FROM CUSTOMERS TO OFFICERS ARE SOLICITED

city in the same general section of the country. In each of the communities served the company is represented by a local manager or a lesser employee, with whom the local public may or may not be in accord. Owing to the comparatively small amount of time the major officials of the company can devote to any one town, a long period may elapse before any public antagonism toward the company will be found out, unless it is reported by the local representative himself. In most cases the representative probably does make such reports promptly. It is the instance in which no such report is made that causes trouble, for once unfavorable public sentiment is established it is an expensive procedure to change it.

Realizing the facts in this situation and wishing to keep in close touch with the opinions of its customers, the Utilities Development Corporation of Chicago has established a system of keeping its officers and its customers in more frequent direct communication. At each city served by the company suggestion boxes have been installed. While the suggestion box idea in itself is not new, this company's method of adapting the idea to its needs is something unique. The printed form

reproduced herewith is used in connection with each box. As will be observed the spirit of the announcement is one of absolute fair-dealing. To eliminate the hesitancy any customer might feel about making a suggestion that would be counter to the known ideas of the local representative, the statement is made that "only the officers of the company will have access to this box." This statement is made in such a manner, however, as not to reflect lack of confidence on the part of the company in its local employees. Therein, it is thought, is the strong feature of this printed announcement. It invites the direct dealing of customers with the company's officers without reflecting discredit on the company's employees.

BUYING ENERGY A BENEFIT TO A MUNICIPAL PLANT

Difficulty in Handling Peak Diminished and Load Factor Greatly Increased by Purchase from Power Company

BY J. E. MELLETT

Georgia Railway & Power Company, Atlanta

An example of the benefits derived by a municipal plant through the purchase of energy from the power company will be noted by referring to the accompanying load curves for this class of business. Before this municipality contracted for energy its plant was inadequate for the city's needs, and more or less difficulty was experienced in handling the regular evening peak which is characteristic of all small municipal plants. All new business was discouraged, electrical stagnation existed, and the load factor was approximately 24 per cent.

After connecting to the Georgia Railway & Power Company's high-tension system there were no limiting features, and the load curve taken in 1916 showed that the load factor was increased to 29.6 per cent. The jagged appearance of this curve in the morning, at noon and early evening was caused by a three-phase

HOW THE PURCHASE OF ELECTRICAL ENERGY IMPROVED THE LOAD CURVE OF A MUNICIPAL PLANT

elevator motor in the only up-to-date office building in the city. A load curve taken early in 1917 indicated that the load factor was increased to 40.5 per cent. Recent maximum-demand indications taken on this plant, together with data on energy consumption, show that a load factor of 46.5 per cent was attained for 1917.

Generators, Motors and Transformers

Getting Good Commutation with Alternating-Current Machinery.—In discussing commutation in alternating-current machinery, M. C. A. Latour says perfect commutation in a continuous current motor depends substantially on the production of a mean resultant neutral field in the region where commutation is taking place. He then goes on to show that the production of a perfect revolving field in a polyphase commutator motor assists in insuring perfect commutation at exact synchronism. In a single-phase commutator motor a polyphase revolving field can be produced at synchronism by utilizing supplementary brushes, short-circuited upon themselves, displaced by 90 electrical space degrees from the main single-phase brushes on the commutator. As in the case of polyphase motors, the problem of securing perfect commutation at synchronism becomes that of producing a perfect rotating field. The use of fractional-pitch windings on the rotor and a sinusoidal distribution of conductors on the stator is of much assistance in this connection. In a motor built in accordance with the principles set forth the commutator difficulties are not serious, the overload range is in excess of that of an induction motor, and the machine can act as a condenser on the system, when operated above synchronous speed. When alternating-current polyphase commutator machines are working above or below synchronism it is necessary in judging the commutation to take into consideration the emf. produced by the resultant field of the stator and rotor in the short-circuited winding sections. If a machine is intended to have the greatest possible range of speed, then it is essential to arrange things so that synchronism corresponds to a speed of perfect operation so far as commutation is concerned.—*A. I. E. E. Proceedings*, February, 1918.

Analysis of Adjustable-Speed Alternating-Current Motors.—Discussing the polyphase shunt motor, W. C. Korthals Altes points out that there exists a demand for a reliable adjustable-speed alternating current motor and then goes on to analyze the advantages and disadvantages of different types now available. For instance, the neutralized motor with shunt-field control is not practicable for commercial frequencies on account of the expensive control equipment required. The induction motor with a commutator on the secondary side is suitable for large outputs, but the control is still too complicated to make this motor suitable for the smaller machine-tool drives. The induction motor with commutator on the primary side offers the best solution for machine-tool motors. The theory of its operation is discussed in detail, and a complete description is given of the mechanism required to shift the brushes and of the new type of armature winding used.—*A. I. E. E. Proceedings*, February, 1918.

Kinematic Device for Imitating Performance of Alternating-Current Machines.—A device consisting of

four movable bars of adjustable length which is used for the purpose of imitating the performance of a series-wound polyphase commutator motor is described by Prof. V. Karapetoff in a paper entitled "Secomor." The bars can be set in a combination to represent the vector diagram of voltages in a motor with any desired constants. By moving the bars to vary the load complete performance characteristics of the motor can be obtained, including speed, torque, power factor, etc. An additional mechanism permits taking into account the impedance drop in the machine. An adjustable saturation curve made of soft wire is used in conjunction with the device to enable one to investigate the effect of saturation. Preceding the description of the "secomor" is a discussion covering the fundamental theory of operation of series-wound polyphase commutator motors.—*A. I. E. E. Proceedings*, February, 1918.

Traction

Use of Iron Transmission Wires for Alternating-Current Railroads.—W. KUMMER.—Because of the shortage of copper, Swiss engineers have studied carefully the practicability of using iron cable in place of copper for the overhead contact wires on railroad systems. Dr. W. Kummer, a Zürich engineer, calls attention to the fact that the successful use of iron for third-rails has caused engineers to underestimate the difficulty of using iron for the overhead contact lines. The

TABLE I—VOLTAGE DROP IN RAILS AND COPPER WIRES FOR ALTERNATING CURRENT PER KM. PER AMP.

Cycles per Second	WIRE OF 50 SQ. MM.			WIRE OF 100 SQ. MM.			WIRE OF 150 SQ. MM.

50	0.46	0.62	0.78	0.34	0.65	0.71	0.24	0.66	0.70

large cross-section of the rail offers far less resistance to the returning current than the smaller aerial wire, the proportion being about one to twenty. Furthermore, old tests and calculations regarding iron wires were based on direct current and not on alternating. Voltage losses with the latter are far greater, as will be seen from an examination of Fig. 1. Taking the maxima of the various curves in Fig. 1, and plotting a new curve with them, the diagram in Fig. 2 is obtained. At the end of a series of equations and formulas, covering large-dimension rails and small-diameter wires, the author finally leads up to a table in which are shown the differences between copper and iron wires as regards voltage losses per kilometer on overhead transmission lines of 50, 100 and 150 sq. mm. cross-section. The rails used were the regular standard Swiss SBB

I-type, weighing 45.93 kg. per meter. The value E_p represents the voltage drop in the overhead wire, E_σ represents the drop in the rails, and E total =

Generation, Transmission and Distribution

Subdivision of Waterfalls in Hydroelectric Practice.—F. PAGLIARO.—There are cases, the author holds, where instead of carrying water power through one conduit to a central point of operation it is more economical to subdivide the total fall into a series of smaller falls, with a corresponding series of operating stations. Stating the various factors of cost that enter into such a calculation, he cites a case where the flow is 15 cu. m. a second and the drop (300 m.) uniform for a distance of 3 km. For a development with one central station these figures of cost are arrived at by the author:

	Francs
Conduit	3,870,000
Central-station building	50,000
Equipment	100,000
Total	4,020,000

With the fall divided into two the figures are thus given:

	Francs
Conduit	2,210,000
Two central-station buildings	100,000
Equipment of first station, including transformer.....	250,000
Equipment of second station.....	100,000
Transmission line between stations.....	30,000
Total	2,690,000

With the fall twice divided at equal distances the cost is found to be slightly more than in the case that has just been considered. The figures are:

	Francs
Conduit	2,010,000
Three central-station buildings.....	150,000
Equipment of first two stations.....	400,000
Equipment of third station.....	100,000
Transmission lines	40,000
Total	2,700,000

Here the second plan, with two falls and stations, is the most economical. However, the author does not forget that a saving in the initial cost of installation may be more than counterbalanced by greater cost of operation and by loss of energy in transmission.—*Revue Générale de l'Electricité*, Jan. 5, 1918 (abstracted from *L'Ettrotecnica*, July 25, 1917).

Telegraphy, Telephony and Signals

Comparative Experiments on the Audion.—G. VALLAURI.—The author gives an account of experiments made with five samples of the audion, with the object of determining their relative behavior as amplifier, generator and detector for the purposes of radiotelegraphy.—*London Electrician*, Feb. 1, 1918.

Miscellaneous

Gas-Engine Troubles and Remedies.—A. L. BRENNAN, JR.—Although during the last few years internal-combustion engines have reached a high degree of perfection, they are still subject to many of their former troubles. How these troubles may be quickly and intelligently diagnosed is told in this article.—*Power*, Jan. 29, 1918.

Buying an Ash-Handling System.—HERBERT E. BIRCH.—How to purchase intelligently an ash-handling system to remove ashes from boiler ash pits is a question that is confronting many engineers and is discussed in this article. It is a timely subject, and the author brings out many ways of solving this apparently simple problem.—*Power*, Feb. 5, 1918.

FIG. 1—RATIO OF A.-C. TO D.-C. RESISTANCE FOR DIFFERENT-SIZE IRON WIRES AND CURRENT DENSITIES

$\sqrt{E_p^2 + E_\sigma^2}$. As a result of these studies, Dr. Kummer looks with interest but with great apprehension upon the attempt to use iron wires for overhead contact lines. The only suggestion which he makes is to subdivide the

FIG. 2—MAXIMUM RATIO OF A.-C. TO D.-C. RESISTANCE FOR DIFFERENT-DIAMETER IRON WIRES

overhead wire, similarly to the wires in a wire rope, and then to design some new type of contactor which would be effective on such lines. A number of small-diameter

Chronicle of Important Events and General Activities in the Technical, Commercial and Manufacturing Fields

NOTE ISSUES APPROVED FOR ELECTRIC UTILITIES

Capital Issues Committee of Federal Reserve Board Acts for Philadelphia Electric Company and in Another Case

The capital issues committee of the Federal Reserve Board has acted favorably upon proposed security issues of electric utilities, holding that the improvements are essential to the conduct of the war.

One issue is that of \$7,500,000 Philadelphia Electric Company two-year 6 per cent gold notes, dated Feb. 1. These will be secured upon the property of the subsidiary Delaware County Electric Company, including its large new Chester power station. They were offered for public subscription at 97 $\frac{3}{4}$ and interest, yielding about 7 $\frac{1}{4}$ per cent, by Harris, Forbes & Company, Drexel & Company and Brown Brothers & Company.

The letter approving this issue, dated Feb. 12 and signed by Paul M. Warburg, chairman capital issues committee, is addressed to the Philadelphia Electric Company and reads:

Referring to the proposed issue of \$7,500,000 two-year 6 per cent gold notes of the Philadelphia Electric Company: After inquiring into the purpose of the issue above described we are of opinion that the sale of said notes is not incompatible with the interest of the United States.

This finding constitutes no approval of such issue as regards its merits, security or legality in any respect.

In any public offer or advertisement of the said issue this letter must be incorporated in full.

Similar approval was given in a letter to Charles A. Hinsch, president Fifth-Third National Bank, Cincinnati, regarding an issue of \$1,560,900 of two-year 6 per cent first-mortgage lien gold notes of the Union Light, Heat & Power Company, Covington, Ky. These notes were offered at 96 $\frac{3}{4}$ and interest, yielding 7 $\frac{3}{4}$ per cent, by A. B. Leach & Company, the Fifth-Third National Bank of Cincinnati and Field, Richards & Company.

A statement issued by the capital issues committee says:

The chairman of the capital issues committee, when seen to-day and asked to make some statement concerning the activities of this committee, said that the support which the committee had received from all parts of the country was most encouraging. He cited as an illustration a resolution voluntarily adopted by the governing committee of the New York Stock Exchange, reading as follows:

"Whereas, the Federal Reserve Board has, upon the request of W. G. McAdoo, Secretary of the Treasury, appointed a committee of its members to act as a capital issues committee authorized to pass upon such proposals as may be submitted to them in respect to capital expenditures or issues of new securities,

"Resolved, that the committee on stock list will require, as a condition to the listing of such new capital issues, the presentation of the approval of such committee of the Federal Reserve Board."

Co-operative resolutions have also been passed on the part of municipalities. A case in point is the League of

Kansas Municipalities, which, among other recommendations, resolved that:

"It is recommended that during the period of the war each and every city government in this State shall undertake only such paving and other improvement work as may be actually necessary to be undertaken at this time, thereby releasing men and money for the service of the national government."

Another illustration of this spirit of co-operation was cited by him in the resolution adopted by the Richmond Real Estate Exchange, Richmond, Va., as follows:

"Resolved by the Richmond (Va.) Real Estate Exchange that the President of the United States and the Secretary of the Treasury be, and they are hereby, requested to issue an appeal promptly to all governors, and through them to state legislatures, mayors and legislative bodies of municipalities, requesting them to exercise the most careful scrutiny over all appropriations, and to exclude from their respective budgets every item that does not represent an actual necessity for the proper conduct of the government, to the end that the states and municipalities may set an example in patriotism and sacrifice for the institutions and individuals within their respective jurisdictions, and that material and labor may be conserved for the needs of the national government."

In dealing with applications so far submitted, the committee has adopted the policy that whenever the application involves the renewal of maturing obligations such renewal should be favorably considered unless there are particular reasons to the contrary. A similar policy is being adopted by the committee in dealing with the funding of banking debt incurred prior to Feb. 1, 1918.

In dealing with bonds to be issued for the purpose of new road construction, the committee has been moved primarily by the consideration of whether or not these roads are of importance either from a military or economic point of view and whether or not results, through the new construction, may be expected to be obtained approximately within the present year.

In passing favorably upon certain projects involving the production of electric power, the committee was guided by the fact that the amount involved was small as compared with the funds already hazarded in such undertakings and by the fact that the power to be produced was required primarily for purposes connected directly with the successful prosecution of the war.

In dealing with municipal and state issues the decisive factor in the deliberations of the committee has been whether or not the expenditure is absolutely necessary for the health and welfare of the community. The committee urges that public authorities, both state and municipal, approve appropriations only where urgently required by the health and welfare of the people.

The advisory committee of the capital issues committee has been in close touch with all local committees established by the twelve Federal Reserve banks, and all personal presentations of applications are being made to them.

On Feb. 8 it held a public hearing at which there appeared representatives of the national organizations of the public utility companies of the country. These representatives discussed with the committee some of the problems and difficulties, both as to operation and finance, under which they were operating due to war conditions. They all pledged their hearty support and co-operation to the purposes to be accomplished by the capital issues committee and assured the committee that during the period of the war capital expenditures would be limited strictly to the most imperative needs. The committee is consulting freely with representatives of the various departments and boards and its work has been facilitated by their advice.

"PLEASE FORGET ABOUT WORKLESS DAYS, DR. GARFIELD. GIVE YOUR UNDIVIDED ATTENTION TO COAL PRODUCTION AND TRANSPORTATION. THAT WILL SOLVE YOUR PROBLEM AND OURS."

TRADE TOPICS DISCUSSED BY CENTRAL DIVISION JOBBERS

War Conservation, Freight Embargoes, Returned Goods, Universal Catalog and Heating Appliance Situation on Chicago Program

At the central division meeting of the Electrical Supply Jobbers' Association in Chicago on Feb. 13 the program consisted mainly of discussion on trade topics and the election of officers.

W. S. Bissell of Toledo, A. C. Downing of Des Moines, Iowa, and James Richardson of Minneapolis each presented a short paper on war conservation and freight embargoes. These papers evoked considerable discussion which brought out the point that jobbers are endeavoring to get along with fewer men. When men are lost from their organizations they advance men already at hand and fill in with men lower in the ranks.

The difficulty experienced in getting shipments due to rail embargoes has been general.

The returned goods evil was discussed informally, and it seemed to be the impression that this troublesome feature of the jobbing business is increasing in extent. Some companies are making a 10 per cent service charge on returned goods, but even this is not an entirely successful expedient since the charge does not nearly cover the entire expense.

As a result of the discussion of a universal electric supply catalog it was decided that Chairman Bernardin should appoint a committee to take up this matter.

The problem of the salesman and his automobile also came up for discussion, and there seemed to be dissent from the opinion that a salesman with an automobile could call upon more customers and solicit business from smaller trade than a man trying to make a territory on foot. There was considerable discussion and

difference of opinion as to the way of arriving at the proper method of compensating the salesman for the use of a car in the company's business.

George E. Hughes, president of the Edison Electric Appliance Company, addressed the jobbers on the heating appliance situation. He also spoke at some length on the policy which the Edison Electric Appliance Company will probably pursue in connection with the jobbing trade.

F. M. Bernardin of the B.-R. Electric Company, Kansas City, was re-elected chairman of the division.

ILLINOIS COMMISSION HAS 500 RATE INCREASE CASES

Approximately That Number Filed in January—
Questions Developed Concerning Property Value
to Expedite Handling Without Serious Delay

Approximately 500 rate cases, in most of which increases are sought, were filed before the Illinois Public Utilities Commission in January.

This large influx of cases, with its demand upon the commission's time, has led to the development of a method of handling rate increase cases which it is believed will facilitate action on many. The commission engineering department has worked up questions dealing with plant property which cover about thirty-five typewritten pages. These can be answered by any practical utility man and do not necessitate detailed valuation.

From the questions it is possible for the commission engineering staff to get a good rough idea of value in much less time than through the older methods. Companies applying for these questions have been supplied by the commission.

War Lessons Shown in A. I. E. E. Sessions

President Rice, at Midwinter Convention in New York, Draws Attention
to the Part of the Electrical Engineer in Carrying the
War Through to Victory

MORE than the usual amount of interest displayed in connection with convention papers was shown at the midwinter convention of the American Institute of Electrical Engineers, held in New York Feb. 15 and 16, as evidenced by the attendance of more than 400 and the lively discussions provoked. In favorable contrast with some meetings where most of the time is devoted to presentation of papers and little or no time left for discussions, at this convention there was time for these. Furthermore, each speaker was limited to about five minutes' talk, so many suggestive ideas were presented. On account of war conditions, the convention was made a purely business affair, sessions being held on Friday morning, afternoon and evening and Saturday morning.

SUMMARY OF THE PROCEEDINGS

The first session was opened by a presidential address by E. W. Rice, Jr., who discussed the great importance of water-power development and railroad electrification as fuel conservation measures. Following this, a paper was presented upon the selection and rating of oil circuit breakers. Substitutes for primary standard cells, the suitability of the thermal-storage type of demand meters for determining consumers' primary charge and the measurement of dielectric losses in three-conductor cables were the general subjects discussed at the afternoon session, each interesting its own particular field considerably.

Between the afternoon and evening sessions a strictly informal dinner was served at the Café Boulevard, at which Mr. Rice spoke on the necessity for co-operation to win the war. About 225 persons attended. Following the dinner a semi-popular lecture was presented by Dr. A. C. Crehore on "Some Applications of Electromagnetic Theory to Matter."

The Saturday morning session was devoted to discussion regarding alternating-current commutator motors. This subject drifted into that of electrification of railroads, some interesting views being presented on the adaptability of different types of alternating-current motors to this service. Considerable interest was shown in a kinematic device developed by Prof. V. Karapetoff for predetermining the performance of series-wound polyphase motors.

Abstracts of most of the papers and discussions are given in this issue on pages 410 to 413, inclusive.

In his address at the opening of the first session E. W. Rice, Jr., president of the Institute and president General Electric Company, followed the lines of his remarks on the same subjects before the Lynn Section on Feb. 2, which were reported in the *ELECTRICAL WORLD* of Feb. 9, 1918, page 322.

"Members of the electrical profession and industry have reason to be pleased with the contributions which they have made for the benefit of the world," said Mr. Rice in introducing his subject. "While we are glad to think that our science and our industry are fundamentally devoted to the products and conditions of peace,

we realize that in the electric light, searchlights, the X-ray, telephones, telegraph, wireless apparatus, electric motors, etc., electricity plays an important part in the grim business of war."

Mr. Rice showed the importance of electricity in coal mining and the effect of railroad electrification in increasing the capacity of trackage and speeding train schedules. He added:

It is estimated that something like 150,000,000 tons of coal was consumed by the railroads in the year 1917. Now we know from the results obtained from such electrical operation of railroads as we already have in this country that it would be possible to save at least two-thirds of this coal if electric locomotives were substituted for the present steam locomotives. On this basis there would be a saving of over 100,000,000 tons of coal in one year.

This is an amount three times as large as the total coal exported from the United States during 1917.

The carrying capacity of our steam roads is also seriously restricted by the movement of coal required for haulage of the trains themselves. It is estimated that fully 10 per cent of the total ton mileage movement behind the engine drawbar is made up of company coal and coal cars, including in this connection the steam-engine tender and its contents. In other words, the useful or revenue-carrying capacity of our steam roads could be increased about 10 per cent with existing track facilities by eliminating the entire company coal movement.

I have not mentioned the consumption of oil by the railroads, which we are told amounted in 1915 to something like 40,000,000 barrels, nearly 15 per cent of the total oil produced. This fuel is entirely too valuable to be used in a wasteful manner. It is important for many reasons that such a wonderful fuel as oil should be most economically used, if for no other reason than that it will be needed for the ships of our forthcoming merchant marine, for the tractors that till our fields and the motor trucks that serve as feeders to our railways.

It should give us courage and optimism for the future of our profession to contemplate the service which we may render in this direction and which it seems to me is immediately at hand. It should arouse in all of us, and particularly in the younger engineers, an enthusiastic confidence in the present and future stability and value of our profession and of the electrical industry. It should satisfy the young engineer that the opportunity for him to render important service is as real and great to-day as it has been in the past for those of us who have seen and participated in the marvelous growth of the industry up to the present.

PRESIDENT RICE'S ADDRESS AT INFORMAL DINNER

At the informal dinner at the Café Boulevard, Broadway and Forty-first Street, on the evening of Feb. 15, Mr. Rice spoke on war conditions and the need for the largest measure of generous co-operation to win the war. His call for "war to victory" met hearty applause.

"There was never a time in the history of the world when work was more needed and when talking is only justified which may help forward the great work which is at hand," were his first words. "We all know what that great job is—the winning of the war. Everything else must wait and take a back seat until that job is done."

Mr. Rice added that we are fortunate in having in our President a spokesman who is able to state the ideals of

the American people and their purpose in this great war in a manner so clear and so impressive as to perfectly satisfy and thrill every loyal American, and he has so appealed to our Allies that he is now accepted as the leading spokesman for all on our side of the war. It is fortunate for the world's future that his messages contain no indication that we will be satisfied with an inconclusive peace, and no matter how much we may hope that his messages may eventually break down the resistance of our enemy, through an appeal to reason, we are warned, said Mr. Rice, that it is vitally necessary to throw our full strength into winning the war, through the exertion of superior military and naval and industrial power. He continued:

The average citizen is mystified and wonders just what is the matter. He was told that the greatest possible production, especially of war material, was vital to our success, and this appealed to his common sense; but just as our manufacturers were getting up speed and working at high pressure they have been ordered to stop and to reduce pressure, as production is said to be ahead of the distributive facilities of the country. He has been told that the army organization has completely broken down. He has seen reports that the submarine menace has been mastered, only to note that the sinkings continue at an alarming rate. He was told that millions of tons of shipping were needed, and an organization was started to build these ships. He saw months of time wasted in talk at a time when every day lost meant the loss of millions of dollars and of thousands of lives. After months of weary waiting the deadlock was broken and we got fairly launched upon a shipping program. We thought that we were running along fairly well when suddenly the entire country was stunned by the recent drastic order of the Fuel Administrator, closing many industries and stopping much of business life.

WHERE PATRIOTISM HAS SCORED

The speaker reviewed the patriotic support of the administration by Congress in the early months of the war, without distinction of party; the Liberty Loans and the patriotic part of "wicked Wall Street"; the drastic scheme of taxation, which will be loyally supported even by those most heavily hit; the magnificent acceptance of the draft system and the Red Cross and kindred activities.

"In view of this record of accomplishment and our truly splendid start in the war," asked Mr. Rice, "why has this feeling of nervousness come over the country? Why has Congress suddenly changed its attitude of unquestioning support to one of investigation and criticism? What does it all mean? Is it true that we are making a failure of the job?" He continued:

It seems clear to me that we have not made a failure, and that everything is moving along as well as we had a right to expect under all the circumstances. When we consider that less than a year ago our nation of a hundred million of people, entirely unprepared for war, with institutions and traditions only adapted to the conditions of profound peace, was thrust into this greatest of enterprises, I think we have already accomplished wonders and that we should not be discouraged. Business men, and especially engineers and manufacturers who understand the nature of the equipment required for this conflict, however, must appreciate that our fundamental, and let us hope not fatal, mistake is that we waited until the war was thrust upon us before we started to get ready.

I think that a little reflection will make it clear that the mistakes that we have made since we started in the war, however numerous or avoidable, are in the aggregate negligible compared with the overwhelming mistake of failure to prepare for the war during 1915 and 1916; that precious time has been lost forever and no effort or time, criticism or talk can cancel that mistake and give us back the lost

time. We must expend untold billions and we must make superhuman efforts, but we must be patient and realize that inconsiderate haste is likely to result in added friction, lost motion, false starts and a general retardation of our program.

FROM THE BUSINESS MAN AND ENGINEER'S VIEWPOINT

Hesitating to make any suggestions, Mr. Rice said, however, as a business man and engineer, that certain matters seem worthy of consideration. He added:

To be successful the people must believe in the war and must work for the war. It would seem, therefore, that, this fact being recognized, we should not attempt to handle the job on the basis that it is to be run exclusively by the party in power. In such an emergency it does not seem probable that we can get best results by our customary majority or party government. All the people must be represented.

The country is greatly encouraged at the large number of able men, prominent in business and other walks of life, who have volunteered for service in various departments of the government and who have been accepted and set to work. This policy should be encouraged, as the more it is followed the better the country will be satisfied and the sooner we will win the war.

It is essential that the men who are charged with enormous responsibilities in our governmental enterprises have the confidence of the country, as their orders, no matter how drastic or arbitrary or apparently unnecessary, should be followed with confidence. At the present time orders are patriotically obeyed, but with some misgiving, due not so much to the hardships inflicted as to the feeling that our leaders do not fully realize what they are doing. There is no lack of confidence in their good intentions and character, but there is some questioning of their wisdom and practical experience.

I like the President's expression, "spirit of accommodation," for that is an essential element of co-operation.

We must have co-operation between the government and industries, and to be effective this means that both must be parties to the co-operation. It cannot be a "lion and lamb" sort of affair. If the governmental heads use their vast power arbitrarily and unwisely, they can easily cripple the industries of the country and thus delay victory for years.

Take, for example, the matter of priority. This is merely one of the factors of production. All large industrial establishments handle such matters through a production department with a production manager at its head. Such a man is settling questions of priority every day. If he settles them wisely, the industrial organization is successful; if he makes many mistakes, the organization will function badly and probably fail. If an inexperienced man were put in charge of the production of any establishment, he could, and probably would, with the best of intentions, reduce the productive efficiency of such an establishment by 50 per cent within a few weeks.

I believe that the problems facing us will be successfully solved in time, but we need more co-operation, more of the spirit of accommodation, all our patience and wisdom, and above all, a willingness to work to the limit.

We must discipline ourselves until a shirker in any field of useful effort will be regarded with the same contempt as a shirker in the military service of the country.

PHILADELPHIA ELECTRIC RATE INCREASE APPROVED

Advance of 10 per Cent in Power Schedule Authorized by Pennsylvania Public Service Commission Because of Higher Costs

An increase of 10 per cent in rates of power consumers of the Philadelphia Electric Company has been authorized by the Pennsylvania Public Service Commission. The advance in rates was approved by the commission on account of the higher expense of operation.

MUCH DISCUSSION ON THE CURTAILMENT OF LIGHTING

Many Viewpoints Developed Before Illuminating Engineering Society After Presentation of Preston S. Millar's Paper

A greatly interested audience gathered at the special meeting of the Illuminating Engineering Society in the Engineering Societies Building, New York, on the evening of Feb. 14, at which a paper on "Lighting Curtailment" was presented by Preston S. Millar, general manager Electrical Testing Laboratories, New York. Extracts from this paper were published in the *ELECTRICAL WORLD* of Feb. 16, 1918, page 370.

President G. H. Stickney in opening the meeting said that there are a great many things in the pursuit of happiness that were commendable a year ago which to-day must either be restricted or eliminated in order that we may carry this war through to victory. Waste of lighting must be prevented. On the other hand, light is a very important adjunct in the war from the battle line back through the lines of transportation, through manufacture, through all the activities of life, and there are some places where lighting may need to be increased. The society has been very fortunate in having opportunities to serve the country in the emergency, said Mr. Stickney.

MR. LIEB ON PRESENT-DAY PROBLEMS

Following Mr. Millar's presentation of his paper, the discussion was opened by J. W. Lieb, chairman National Committee on Gas and Electric Service. Mr. Lieb expressed the appreciation of the National Committee for the effective co-operation rendered by the Illuminating Engineering Society and the readiness and enthusiasm with which the members of its war service committee had responded to the repeated calls made by various government departments through the national committee and passed on to the society. He described the attitude which the national committee, acting on behalf of the gas and electric utilities, has taken in co-operating with the authorities in restricting unnecessary use of energy.

Mr. Lieb added that he would not endeavor to discuss the wisdom or the expediency of avoiding, as has been done, the classification of industries into essential and non-essential or dispensable and indispensable. He declared, however, that if any one wished to obtain for himself some idea of the difficulties involved in such a preparation of order of priority, say, of industries, he might make out what he would think was a proper order of priority or of dispensability of industries, classify it either by classes of business or industries, and he would find out very soon the enormous difficulties which such a classification presents. The fundamental touchstone is, "Is this or that industry immediately contributory to the conduct of the war?" Following that must of necessity be the consideration, "Is this or that industry indispensable to the public health and public welfare?" From these two fundamentals one would branch out and go down the list through industries of varying importance. The difficulties in making such a differentiation are enormous and they really do not impress themselves until one undertakes to make for himself such a differentiation, Mr. Lieb said.

In giving estimates as to the effect of lighting cur-

tailment Mr. Lieb said that exterior illumination was estimated at one-half of 1 to 1 per cent of the total output. It is not easy to find a difference in coal consumption of one-half of 1 to 1 per cent, but when it is coupled with the proposition that selected coal is impossible to obtain and when there is a variation in coal consumption from day to day of 10 or 15 per cent, the problem has added difficulties.

The experience of most of the prominent lighting companies in the five day suspension period was that roughly the output of power houses was curtailed on the average about 25 per cent, said Mr. Lieb. On the closed Mondays there was a reduction of approximately 35 per cent.

Dr. Coleman W. Cutler, chairman illumination committee, National Committee for the Prevention of Blindness, said that the saving of light may be of value in the saving of energy. The most of what the increased flood of lighting has given to the world is very beneficial, but some people cannot keep up with the demands of highly stimulated conditions. Children and working classes suffer most from insufficient lighting, and curtailment of their supply would be little short of criminal.

Dr. M. G. Lloyd, Bureau of Standards, expressed thorough sympathy with the general attitude of the author of the paper. He said that he would like to see the Fuel Administration conduct a campaign along the lines of the Food Administration, bringing home to every power plant operator and to every residence dweller who operates a furnace the necessity for making the best use of fuel. Dr. Lloyd referred to the estimate in the recent paper of Lynn S. Goodman and William B. Jackson before the American Institute of Electrical Engineers [see *ELECTRICAL WORLD*, Jan. 19, 1918.—Eds.] that the increased coal consumption due to poor quality is 10 per cent. If that could be eliminated there would be, on the figures given in the paper, a saving of 64,000,000 tons, which would more than cover the estimated shortage, and then the little saving effected by cutting down on lighting would be unnecessary.

Frank W. Smith, chairman lamp committee, National Electric Light Association, and vice-president United Electric Light & Power Company, New York, spoke of the action of New York electric and gas companies in circulating 1,800,000 fuel conservation cards among their consumers. He said that of the 145,000,000 lamps sold in the United States in 1916 more than 16 per cent were of the carbon and gem types. A very material saving in fuel would result from substitution of more efficient lamps.

DR. BELL ON THE FUEL ADMINISTRATION

Dr. Louis Bell, Boston, said that central stations would do their part manfully and would see that the use of light is economized so far as the saving does not interfere with the country's efficiency. He urged, however, that the Fuel Administration cut out unnecessary industries with a ruthless hand. The Fuel Administration could drive hard at the wastes which are unnecessary and inexcusable in business that has nothing to do with the great end of the war. The Fuel Administration before turning to central stations to curtail output or simultaneously with that demand (for these properties are willing to take their medicine with the rest) should suppress unnecessary industries.

Bassett Jones, New York, brought out the importance of a campaign to economize fuel in the home, similar to the Food Administration campaign.

W. A. Durgin, Commonwealth Edison Company, Chicago, discussed the necessity for developing efficiency in household fuel consumption and also the importance of saving eyesight as factors that should have careful consideration.

W. D'A. Ryan, General Electric Company, said that lighting is not anywhere near as large in volume as it should be. In place of an increase of 73 per cent there should be from 100 per cent to 200 per cent increase.

After the successful conclusion of the war, street lighting and industrial lighting should be increased an average of 150 per cent. In his work of illumination in Western cities Mr. Ryan is increasing the light, not 100 or 200 per cent, but from 500 to 1000 per cent. Recently the white way lighting in an Eastern city has turned out. This is protective lighting, and after three nights, on account of the increase of crime and nuisances, it was found necessary to restore the illumination.

Norman Macbeth, New York, said that newspapers had made a tremendous fuss about electric advertising. This is a form of advertising that has justified itself; it reduces sales cost.

MR. DOANE ON GROWTH OF LIGHTING BUSINESS

S. E. Doane, National Lamp Works of General Electric Company, said that the lighting business of the country has increased more rapidly than ever before. In spite of the effort to economize in lighting, the building of shipyards, operation of factories at night, construction of cantonments and many other things have tended to increase the use. Mr. Doane said he did not see how the industries could be served better than by making the fact clear that the solution of the problem does not lie in conserving lighting. We can look forward to no saving of coal, but on the contrary to a greater use of coal for lighting than ever before. Emphasizing the need of economy in lighting and in fuel in the home, Mr. Doane urged that the services of patriotic women should be enlisted.

W. J. Serrill, Philadelphia, thought that the chances were that the transportation system would be improved so much next winter that such a crisis would not occur again and that there ought not to be any reduction in lighting. Mr. Serrill expressed the opinion that a great deal of the present white way lighting is an extreme vulgarity and an advertising defacement of the cities. Considering what the illuminating engineer has done in flood lighting, what beautiful effects can be shown on the handsome facades of buildings, Mr. Serrill thinks that it is a pity to push too far the present type of moving sign lighting.

Mr. Jones spoke of the question of painting for light. He will report at a later meeting of the society the case of a factory in which the painting for light was so worked out that repeated tests showed utilization of over 100 per cent; in other words, that more light was being received than the lamps furnished. It is remarkable what can be done by treatment of the wall surfaces. Prism glass was also used in the windows of the factory.

R. E. Simpson, engineer Travelers' Insurance Company, Hartford, Conn., said that a director of a com-

pany operating twenty or more mills ordered that all unnecessary lighting should be cut down. One foreman cut out the lighting of stairways and other unfrequented places. The result was unprecedented increase in the accident rate, particularly at the points where lights were taken away. This was brought to a climax when one man was caught by a shaft near the ground and killed.

Among others who contributed to the discussion were A. L. Powell, Frank E. Wallis, W. H. Rolinson and W. J. Hammer. Mr. Millar also spoke in closing the discussion.

WITH EXCESS POWER SUPPLY, LOUISVILLE SEEKS INDUSTRIES

Margin in Capacity Above Current Demands of Customers Used to Boost Campaign for New Industrial Establishments

Donald McDonald, vice-president and general manager of the Louisville Gas & Electric Company, has been named vice-president of the Louisville Industrial Foundation, the million-dollar industrial department of the Louisville Board of Trade, which public subscription

10,000 K.W. Surplus Electric Power In Louisville, Ky., for Manufacturing

The Louisville Central Power Station has at this time more than 10,000 K. W. surplus electric power for industrial purposes, immediately available.

Louisville can supply a considerable area of floor space for manufacturing purposes.

Modern dwellings for workmen are available in Louisville at moderate rentals.

Louisville is one of the few cities of the United States favored with surplus electric power for industries in excess of present demands.

The Central Power Station owns its coal mine and operates its own coal cars, assuring a plentiful supply of fuel and continuity of surplus electric power.

Surplus electric power, together with industrial floor space and comfortable homes for workmen, affords manufacturers a remarkable opportunity for additional industrial operations at this time.

For detailed information and power rates, write or wire

Louisville, Kentucky

HOW THE LOUISVILLE BOARD OF TRADE IS ADVERTISING THE OPPORTUNITIES OFFERED INDUSTRIAL ENTERPRISES BY THE KENTUCKY CITY

has supported for the purpose of attracting new industries to the city. This department has already been of considerable benefit to the Louisville Gas & Electric Company, as the foundation, offering financial aid in some cases, has been instrumental in getting a number of small industries using central-station service to locate in Louisville.

The accompanying advertisement from the New York Times shows what Louisville is doing.

WAR SERVICE WORK OF THE UTILITIES COMMITTEE

Returns to Fuel Administrator on Five Workless Days and Three Mondays Show Perhaps 30 per Cent Saving in Fuel

A report of recent activities of the National Committee on Gas and Electric Service, of which J. W. Lieb is chairman, has been received by the ELECTRICAL WORLD. It says that with improvement in weather conditions the reports received from public utilities give reason to believe that transportation facilities have ameliorated considerably and that both coal and oil shipments are moving with more freedom. At the request of the Fuel Administration the public utilities secured information as to the relative saving in output and coal supply for the five-day period and three Mondays following. The returns showed about 21 per cent reduction in output and a coal saving of perhaps 30 per cent.

The report of the committee says in part:

The Fuel Administration through M. L. Requa, Oil Administrator, has issued an order of preference for oil shipments. Public utilities are placed in the fifth class, thus insuring them a continuous supply of fuel and gas oil. The preferential order is divided into twelve groups, and it is estimated that the first ten groups will use but 60 per cent of the oil produced. From this it is quite evident that there will be an ample supply to care for the wants of the public utilities.

The Director General of Railroads has also issued instructions that both coal and oil are exempted from all embargo restrictions, thus giving free movement forward of these commodities which are an essential part of the supply of every public utility.

The priorities committee of the Council of National Defense has recently issued a new form of application for priority, to which is attached a form for the applicant making an affidavit that the conditions are as represented in the application. These forms of priority are used particularly for the procuring of material which is very essential to plants that are furnishing electrical energy to munitions manufacturers in general.

Surveys are still being conducted throughout the country in order to obtain accurate information as to the conditions of electric power supply for manufacturing purposes. It has also become necessary to make an investigation of the gas companies on which demands are being made for the industrial use of gas, which much exceeds the capacity of some of the gas companies. It is very much to be desired that public utilities notify this committee of any excess available power that may exist in their communities which would attract war material manufacturers to their vicinity.

The committee has been requested by the Quartermaster's Department to find in the public utility field, if possible, 200 or 250 competent auditors. It is extremely difficult to get information on this class of work, and the public utilities are probably in the same position as other industries in having very few such men available.

"Terminal pools" have been formed in about half a dozen large centers in the Middle West, and these pools are working quite satisfactorily in improving the delivery of coal to public utilities.

A zoning system of coal production areas which will supply coal to zones of consumption in order to avoid cross haulage is being considered and worked out by the Fuel Administration, but no orders on this have yet been issued. It has, however, been definitely decided to make no effort for the present toward arranging for zones of gas coal.

Senator Ramsdell of Louisiana headed a delegation which called on the committee in Washington with reference to procuring assistance in the developing of natural gas wells in Louisiana for the purpose of furnishing service to war industry plants, such as the proposed chemical plants which are being constructed by the government. Arrangements

were made to bring his proposition before the proper authorities.

The commission on car service has recently issued Circular No. 84 containing instructions to all the carriers that in confiscating coal no coal must be taken that is consigned to public utilities. The gas and electric companies will feel considerably relieved when these instructions are carried out, as the taking of coal by the railroads has seriously interfered with the operations of public utilities.

The committee is also working with the conservation department of the Fuel Administration Bureau on several plans to conserve the consumption of coal, and will shortly seek information from the various public utilities in order to arrive at conclusions as to the best way to proceed.

Information is being received by the committee from the various public utilities requested to furnish information to be presented to Dr. Garfield showing the percentage of output of either electric energy or gas to be used by manufacturers turning out war materials. Some of these reports indicate an amazingly high percentage of output furnished for this purpose.

The War Department has recently asked the committee to obtain information as to the possibility of taking over 200,000 kw. in turbine units which have been ordered by central stations from the large electrical manufacturing companies. This does not necessarily mean that the turbines will be commandeered, but a survey of these conditions has been thought necessary by the department, and the committee is being used as the avenue for procuring this information.

The committee has been called upon to furnish the names of several young men who have had experience along operating lines with central stations and power plants to enter the government service with commissions. It is the intention to place these men in the service of the War Department and assign them to make a survey of electrical conditions throughout the country and expedite matters in connection with power service to war industry manufacturers.

INDUSTRIAL PEACE

CONFEREES NAMED

Secretary of Labor Wilson Announces Personnel of Joint Conference of Employers and Union Labor Leaders

Secretary of Labor Wilson has announced the personnel of the joint conference of employers and union labor leaders who will lay down a basis of relations between capital and labor during the war. Five members, as follows, were chosen to represent each side by the National Industrial Conference Board and American Federation of Labor and they will select two additional representatives of the public.

Representatives of employers: Loyal A. Osborne, New York, vice-president Westinghouse Electric & Manufacturing Company and chairman executive committee National Industrial Conference Board; Charles F. Brooker, Ansonia, Conn., president American Brass Company; W. J. Vandervoort, East Moline, Ill., president Root & Vandervoort Engineering Company; L. F. Loree, New York, president Delaware & Hudson Company; C. Edwin Michael, Roanoke, Va., president Virginia Bridge & Iron Company.

Representatives of workers: Frank J. Hayes, president United Mine Workers of America, Indianapolis; William L. Hutcheson, president United Brotherhood of Carpenters and Joiners of America, Indianapolis; J. A. Franklin, president Brotherhood of Boilermakers, and Iron Shipbuilders of America, Kansas City, Kan.; Victor Olander, representative International Seamen's Union of America, Chicago; T. A. Rickert, president United Garment Workers of America, Chicago.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Philadelphia Section, I. E. S.—Pres. S. Millar addressed the Philadelphia Section of the Illuminating Engineering Society on Feb. 15 on the subject of "Lighting Curtailment."

Chicago Section, A. I. E. E.—Thaddeus Bailly and John A. Seede will address the Chicago Section of the American Institute of Electrical Engineers on Feb. 25 on "Electric Furnaces."

Schenectady Section, A. I. E. E.—P. W. Wilson, special correspondent for the *London Daily News*, addressed a meeting of the Schenectady Section of the American Institute of Electrical Engineers on Feb. 20 on the subject of "Britain at War."

Engineers' Society of Milwaukee.—E. S. H. Baars of the Vilter Manufacturing Company gave an illustrated talk on "Coal Accumulators and Their Application to the Refrigerating Industry" at a meeting of the Engineers' Society of Milwaukee on Feb. 13. Alexander H. Luedicke and Fred Goes of the same company gave an illustrated talk on army refrigerating equipments.

Association of Iron and Steel Electrical Engineers.—The next regular meeting of the Philadelphia Section will be held on March 1. John S. Rowan of the Rowan Controller Company of Baltimore will present a paper on "Standardized Mill Table Controllers." B. W. Gilson of the Carnegie Steel Company, Youngstown, Ohio, will deliver a paper on "Generation, Distribution and Consumption of Power" at the regular meeting of the Cleveland District Section to be held Feb. 23. A joint technical session of the A. I. E. E. and the Cleveland District Section of the A. I. E. E. will be held March 18. The Pittsburgh Section will meet March 16.

Prominent Engineers Attend Dedication of Dayton Engineers' Club.—The following attended the ceremonies in connection with dedication of the new Engineers' Club at Dayton, Ohio: Dr. W. O. Thompson, Gordon Rentschler of Hamilton, Elmer A. Sperry, Sr.; Elmer Sperry, Jr., and F. M. Tait of New York, Lieut. F. Vezzani, Col. J. J. Carty, Gov. James M. Cox, Major J. G. Vincent, H. M. Allen of Troy, Dr. L. H. Baekeland, Dr. Clark W. Chamberlain, Major C. M. Hall, W. B. Mayo and F. P. Book of Detroit, Commander McCormick, U. S. N.; J. H. Libberton of Chicago; C. E. Drayer, Cleveland Engineers' Club; A. M. Wilson, Cincinnati Engineers' Club; F. W. Weissmann, American Chemical Society, Cincinnati; Walter S. Wing, Society of Engineers of Western Pennsylvania; Col. E. A. Deeds, C. F. Kettering and Major Orville Wright.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Accounting in Illinois.—The accounting department of the Illinois Public Utilities Commission has prepared standard accounts for gas, electric, water and heating companies, effective on Jan. 1, 1918.

Surcharge Authorized in Noblesville, Ind.—The Indiana Public Service Commission has entered an order authorizing the Noblesville Heat, Light & Power Company to add a surcharge, as a wartime emergency measure, of $\frac{1}{2}$ cent for each kilowatt of energy furnished. The order extends to Feb. 1, 1919. The commission estimates that a surcharge will bring the company about \$2,500 additional revenue during the coming year. Increased cost of operation, including the tremendous increase in price of coal, made addition to the revenues necessary.

Overtaxation.—A decision of the New York Public Service Commission, First District, written by Commissioner Travis H. Whitney, places responsibility for the poor condition of many surface railroads upon the burden of overtaxation placed on them by city and State. Denying the application of the North Shore Traction Company for authority to increase the fare from 5 to 7 cents, the decision says: "The responsibility of the city and State authorities for inadequacies of the corporate income of companies such as this petitioner is thus strikingly manifested. If the city and State wish to require passengers to pay high enough fares to enable the street-railroad companies to pay into the public treasury not only real estate, local and school taxes but also franchise taxes, percentages on gross earnings and the like, and in addition wish the passengers within a comparatively short period to buy for the city and pay for property which the city says must pass soon to city ownership without further payment therefor, the bearings of such a policy should be frankly recognized. What goes into the public treasury must under such circumstances come out of the fare payer or must in some other form come out of the taxpayer. It cannot, over any long period of time, come out of the investors. Efforts to leave the investors to bear the burden can only mean deterioration of service, failure to make needed extensions and eventual receivership. Ought the city to require passengers to pay the cost of early city ownership of all the company's property situated in the city streets and nevertheless leave the company's property unable to do more than furnish to those passengers grossly inferior service?"

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Exercise of Care in Stringing Power Wires Across Telephone Wires.—It is the duty of an electric company in the construction and maintenance of its wires carrying heavy currents of electricity across the space where telephone or other such wires are strung to make approved and effective provision against the communication of its current to such telephone or other wires, it was held by the Supreme Court of Appeals of West Virginia (94 S. E. 372).

Duty to Repair Wires.—While a telephone company is bound to exercise ordinary care to keep its poles, wires and appurtenances in such condition as will make their presence along a highway reasonably safe for persons traveling thereon, it is not liable for injuries occasioned by a break because of an unknown defect occurring after nightfall, which was repaired the following morning as soon as discovered, the Court of Appeals of Kentucky held (198 S. W. 721).

No Liability When Adequately Forewarned.—Where an employee of the city water commissioners who was killed while patching gutters on a pumping station by contact with wires supplying the electric power to the station was warned not to get near the wires and told after finishing one gutter to move his ladder around to another and thus avoid the wires, and where if he had heeded such instructions he would not have been injured, there could be no recovery for his death from the employer or the power company, the Supreme Court of North Carolina held (94 S. E. 299).

Negligence in Case of Broken Wire.—Unexplained, the fact that the feed cable of an electric street railroad had broken away from its fastening to an iron pole at the street side and at intervals came in contact with the pole, as a consequence of which a boy received a shock, created a presumption of negligence, under the doctrine of *res ipsa loquitur* (the thing speaks for itself), the Supreme Court of New York, Appellate Division, held (167 N. Y. S. 690). The presumption of negligence from the fact of a feed cable of a street railroad having broken loose from its fastening to an iron pole at the side of the street, and so having come in contact with it occasionally, thus shocking a boy, is not overcome by showing that this was caused by lightning in the forenoon, eight hours before, in the absence of convincing evidence that the company exercised all reasonable care to discover and remove the menace.

Employment of Girls as Meter Readers.—The Binghamton (N. Y.) Light, Heat & Power Company has begun to employ girls to read meters and deliver bills. It has been found advisable to do this on account of the general labor conditions, and it is in line with the policy adopted about six months ago of employing girls in all branches of the work where it is feasible to do so, thereby releasing many men for federal service.

Saving Power in Canada.—The Hydro-Electric Commission of Niagara Falls, Ont., at its annual meeting elected Mayor H. P. Stephens chairman. A communication was read from Sir Henry Drayton, Dominion Power Controller, and the Ontario Hydro-Electric Power Commission asking the city to reduce street lighting. A municipal campaign will be waged urging householders to reduce electric lighting in homes so as to release additional power for Canadian war industries.

Speeding Instruction at Cornell.—Because of the exceptional demand for trained engineers for government war needs, the faculty of Sibley College of Mechanical Engineering, Cornell University, has signified its willingness to carry regular work for the present sophomore and junior classes through the summer as a first term of the junior and senior years respectively, and to continue sixteen-week terms, practically without interruption, until these classes are graduated. This will furnish graduates for government service considerably earlier than would be possible otherwise. This is regarded as a war measure only and will not remain in force at the close of the war.

Terre Haute, Indianapolis & Eastern to Buy Plant.—The Terre Haute, Indianapolis & Eastern Traction Company has petitioned the Indiana Public Service Commission for authority to purchase the common and preferred stock of the West Indiana Utilities Company, which operates lighting plants at West Terre Haute and Brazil, Ind., for \$121,000 cash, and for authority thus to eliminate competitive conditions at Brazil. The traction company has sold electricity to the West Indiana Utilities Company plant there and also furnished similar service itself. The common stock of the West Indiana company totals \$50,000 and preferred stock \$150,000, representing all the capital.

Common Stock Dividend Passed.—Commonwealth Power, Railway & Light Company directors have passed the common stock dividend. A dividend of 1½ per cent was declared on the preferred, payable in scrip due on or before Feb 1, 1924, with 6 per cent interest payable semi-annually. President Anton G. Hodenpyl said: "While the earnings are sufficient to pay the usual dividends, nevertheless because of the present abnormally high cost of operation and the inadvisability if not impossibility of marketing long-time securities, your directors have felt that the company's net earnings should for the present be conserved and used in place of the moneys usually derived from the sale of securities."

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Stops Payments to Soldiers and Dependents.—In general it has been decided by the board of directors of the Commonwealth Edison Company that the practice of the company in making payments to the dependents of employees who have entered the military service of the United States should be suspended as of Jan. 1, 1918. It was found that the government plan of allotments, etc., was in effect the same as the company's plan, except that in some cases the amount to be paid by the government was less. It was decided that in certain cases the company might continue to do something for dependents of employees in military service.

Power Development Commission Completes Work.—The Power Development Commission of New York, headed by Senator George F. Thompson of Niagara, has completed its seven years' labors in the investigation of the possibilities of water-power development. The outstanding feature of its report to the Legislature is that it places on record the meaning of the waste of force at Niagara Falls. The commission states that half the flow of Niagara River, if diverted to the purpose, would light and heat all the homes of the State and turn all the wheels of industry, with a saving of the 40,000,000 tons of coal burned last year. Washington officials are to be urged to seek the concurrence of Canada in such changes in the treaty as would permit the use of waters above the Falls for the development of hydroelectric power of ten times the present limit of 400,000 hp.

Inmates of Institution Help to Save Valuable Metals.—The House of Correction, Chicago, under the direction of John L. Whitman, is effecting considerable saving in handling junk material discarded by municipal departments or institutions. Pieces of copper wire discarded by the electrical department are collected and the rubber and lead insulation is removed by hand. Under the commercial system of reduction the rubber would be lost. By employing unskilled labor the superintendent was able to conserve over \$11,000 worth of rubber. One inmate was employed in cutting small particles of platinum in electric light bulbs discarded by various public buildings. Working with an old washboard and a druggist's mortar, he conserved over \$9,000 worth in less than a year. The lamps were of the older type, since platinum has not been used in constructing the leading-in wires of incandescent lamps for three years. Some lamps dating back more than twenty years contain 10 cents' worth of platinum at present prices.

Sanitary District Raises Salaries.—The Sanitary District of Chicago has raised the salaries of all employees who did not receive salary increases last year. The total raise distributed among 525 employees amounts to \$60,000 per year, bringing the total salary payroll of the Sanitary District up to \$1,062,000 per annum. A large percentage of the men in the engineering department of the district are affected by this order.

Civilian Workers Needed for Army Ordnance Department.—The Ordnance Department of the army urgently needs several thousand civilian workers. The United States Civil Service Commission is conducting an extensive campaign to obtain this needed help. Workers are desired for different classes of positions, including clerical, testing, mechanical trades, drafting and inspection. They are vitally necessary in the prosecution of the war. They will form part of the forces behind the front without which the actual fighters would be powerless. For further information apply to the representative of the United States Civil Service Commission at the post office or custom house in any city, or to the Civil Service Commission, Washington, D. C. Except for the positions of stenographer and typewriter, typewriter operator, multigraph operator and general clerk, applicants are not assembled for a written examination, but are rated principally upon their education, training and experience, as shown by their applications and corroborative evidence.

Men Wanted for Navy Aviation Service.—The Navy Department announces that men will be selected soon for aviation service. Men of suitable qualifications who report now to the navy recruiting offices are eligible for examination for commissions and ratings. Rates of pay and duties assigned will make this opportunity highly attractive to mechanical engineers and to draftsmen, mechanics and others experienced in gasoline engine design or operation. Men are to be selected to equip for special work in connection with aviation as follows: Experienced engineers for engineer officers at the various naval air stations; experienced gasoline engine men for further instruction at Columbia University and special instruction at Packard Motor Company on Liberty engines; graduate mechanical engineers and men of experience along engineering lines for special duty in Bureau of Steam Engineering and in connection with work of this bureau at various places; aeronautical and other gasoline-engine draftsmen for work in the Bureau of Steam Engineering; men who have had experience in compressed gases, especially hydrogen; mechanical engineers for special work under the Bureau of Construction and Repair; mechanical draftsmen for duty in Bureau of Construction and Repair on aviation work; suitable men for training for quartermasters' (aviation) and carpenters' mates. Full information may be obtained at any navy recruiting office.

J. B. OLSON

James B. Olson, who has resigned from the Habirshaw Electric Cable Company, Inc., of which he was assistant secretary and general sales manager, as noted in last week's *ELECTRICAL WORLD*, is one of the best-known wire men in the country. Mr. Olson entered the wire industry in 1888 with the New York Insulated Wire Company. In 1892 he went to Chicago, where for two years he was Western sales manager for that company. On Jan. 1, 1894, he resigned to go with the India Rubber & Gutta Percha Insulation Company, afterward changed to Habirshaw Wire Company, of which he was made general sales manager and afterward secretary. On the consolidation of this company with the Electric Cable Company and the Waterbury Company, two years ago, Mr. Olson became general sales manager of the new company, the present Habirshaw Electric Cable Company. Later he was made an officer of the company under the title of assistant secretary.

Frank E. Watts, New York district manager of the Hart Manufacturing Company, past-Jupiter of the Jovian Order and former Eastern manager of the *ELECTRICAL WORLD*, is suffering from a broken leg received as the result of a fall on an icy pavement on Wednesday of last week. His right leg is broken about four inches above the ankle.

Prof. D. M. Folsom, head of the School of Mines at Stanford University, California, on Feb. 6 was made petroleum administrator for the Western States by Mark L. Requa, National Oil Administrator. Mr. Folsom has been serving as chairman of the petroleum committee of the State Fuel Administrator in California and is one of the leading oil experts of the West. In his new capacity he will have supervision over the production and distribution of petroleum in the States of California, Washington, Oregon, Idaho, Utah, Nevada and Arizona and the Territories of Alaska and Hawaii. This appointment is taken to mean the abolition of the petroleum committee, which consisted of Professor Folsom and two members of the Railroad Commission of California.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

H. G. Bonner, formerly new-business manager of the Alliance (Ohio) Gas & Power Company, has been made manager, succeeding F. C. Pratt. Mr. Bonner entered the Doherty organization five years ago as new-business manager at Elyria, Ohio, having been prior to that manager of the Louisville (Ky.) branch of the Westinghouse Electric & Manufacturing Company.

Samuel Scovil, president of the Cleveland Electric Illuminating Company, has resigned, and is now in the employ of the government as representative of the Cleveland district of the Federal Ordnance Department. Mr. Scovil has been president of the Cleveland company for the past four years, having been vice-president prior to that. Mr. Scovil, who is well known throughout the electrical industry, was elected third vice-president of the National Electric Light Association at its annual meeting last summer.

Frederick W. Prince, superintendent of the lighting department of the Hartford (Conn.) Electric Light Company, has resigned to join the staff of the Franklin Electric Manufacturing Company of Hartford. Mr. Prince is well known in central-station circles, having taken an active part in the work of the New England Section of the N. E. L. A. and been employed by the Hartford company for about eighteen years. He was educated at Trinity College, Hartford, graduating in electrical engineering under Prof. W. L. Robb, for many years consulting engineer of the Hartford company. In his new work, which is scheduled to begin April 1, Mr. Prince will hold the title of quality expert, co-ordinating the work of the engineering, production and sales departments, with headquarters in Hartford.

Charles Reginald Underhill, who has recently been appointed captain in the aviation section of the Signal Reserve Corps, as announced in the Jan. 12 issue of the *ELECTRICAL WORLD*, was chief electrical engineer of the Acme Wire Company, New Haven, Conn. Mr. Underhill was born in 1874 and received his primary education in the district schools near Buffalo. After a brief career as telegraph operator, he entered the employ of the Western Electric Company, New York City, in the inspection department. During the latter term of this employment, having charge of the inspection department as assistant chief inspector, he became interested in the design of electromagnets and resigned to become chief electrical engineer of the Varley Duplex Magnet Company, and in the next four years, while connected with this company, he made numerous experiments with elec-

C. R. UNDERHILL

tromagnets, particularly the solenoid type, the results of which were published in a series of articles in the *ELECTRICAL WORLD*. In the same period he wrote his book "The Electromagnet." About this time wireless telegraphy was being rapidly developed, and Mr. Underhill invented and demonstrated a wireless printing telegraph system. From 1904 to 1909 he was consulting electrical engineer in New York City, specializing in signal systems and electromagnet devices. At this time he wrote his book "Solenoids, Electromagnets and Electromagnetic Windings," and in collaboration with W. W. Massie wrote "Wireless Telegraphy and Telephony." For a brief period Mr. Underhill was employed as editor and technical writer for the Westinghouse Electric & Manufacturing Company, from which position he resigned in 1910 to become chief engineer of the American Electric Fuse Company. Since 1911 he has been employed by the Acme Wire Company as chief electrical engineer, during which period he has made extensive researches into the operation of electromagnets. For several years past he has lectured at the leading engineering colleges on the subject of electromagnets and their application. Mr. Underhill is the author of "Electromagnets, Induction Coils and Condensers," Section 5 of the "Standard Handbook for Electrical Engineers." He is a member of a number of national engineering societies, in addition to being a fellow of the American Institute of Electrical Engineers.

Obituary

Prof. Joseph Frederick Klein, dean of the faculty and head of the mechanical engineering department of Lehigh University, died suddenly on Feb. 11. Prof. Klein was born in Paris in 1849 and came to this country when four years old. He attended the Sheffield Scientific School of Yale University, from which he received the degree of Ph.B. in 1871 and the degree of D.E. in 1873. He had been professor of mechanical engineering at Lehigh since 1881.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

CHANGING CONDITIONS IN VACUUM-CLEANER MARKET

Manufacturers Considering More Closely Problems of Distribution in Order to Eliminate Certain Abuses Arising from Ignorant Competition

The general condition in the vacuum-cleaner field is unsatisfactory. This is true not on account of the volume of sales, for manufacturers are at present finding it easy to sell all the machines they can make from the material they can get. It is true, however, on account of the relations obtaining between the manufacturers and the various distributing agencies. On account of the fact that in the past manufacturers have mainly sold vacuum cleaners by going out to agents with a special proposition entailing extensive advertising, campaigns and free services of salesmen, the business has got into a state where the profit to the manufacturer is generally unsatisfactory.

Owing to the present steady demand and the limited supply, the time seems propitious to manufacturers for changing their policies and putting the sweeper on a commodity basis. One large manufacturer is making a serious effort to overcome past mistakes made in direct selling and is organizing to sell through the electrical trade. Another who had become dissatisfied with the electrical trade and who branched out into the hardware and department store field to obtain his agencies is considering coming back into the electrical trade. Efforts are being made to bring more manufacturers to a realization of the conditions which have been making the business unprofitable with a view to correcting the abuses.

It is necessary that in this movement the trade should realize its own responsibility. The movement to be a success requires the co-operation of the trade through the extension of its loyalty to the manufacturers who operate on a sound business basis instead of bestowing patronage first upon one manufacturer and then upon another because of some extra inducement which is offered temporarily. As a plain case of sound economics, it is pointed out by those interested, the trade should realize that it will be best served by the manufacturer who is making a fair profit and who is operating on an even turn-over basis.

JOBBER'S LAMP STOCKS MORE CAREFULLY ASSORTED

Manufacturers Are Aiming to Accomplish a Better Distribution on an Even Basis—Readjustment of Requirements Under Way

Jobbers in the East have stated that the situation on incandescent lamps has greatly improved since the middle of January. They also said that hereafter conditions would continue to become better and that shortages and stringency had ceased. In fact, by a reassortment of stocks a saving of at least 30 per cent, it is averred, has been effected in the quantity and sizes heretofore carried. Lamp voltages have also been rearranged on standard sizes to the advantage of jobber and dealer, a fact which the user or consumer will appreciate.

When a leading manufacturer was consulted in reference to the foregoing statement he said stocks in the hands of distributors and jobbers had been reassorted. A few sizes rather out of the ordinary in wattage had been eliminated from the regular sizes, but were still carried in factory stock on call. Jobbers and distributors, according to the ELECTRICAL WORLD informant, were required, under their

contracts, to submit a quarterly inventory of their lamp sales and merchandise on hand. This practice, it was learned, is the general rule in the trade. The inventories for the quarter ended Dec. 31, 1917, were more carefully scrutinized in view of the many reports that shortages existed in certain sections on particular types and sizes.

It was ascertained that the statement was well founded, but the fault was not factory underproduction but that the manner of distribution was at fault. The manufacturers, it is stated, were therefore satisfied that it was necessary to put into circulation some types and sizes that had been in jobbers' stocks for quite a while without moving. Items that were in this class, while not in great demand in one section, were strong sellers elsewhere where shortages existed. A close study of the situation by expert sales and factory stock managers led to the practical conclusion that a more satisfactory distribution could and should be devised to relieve the pressure and meet the demand on a more equitable basis. This is now under way, and an improvement in the lamp situation is acknowledged by the trade.

Combing over the jobbers' inventories revealed the weakness and error of previous methods of distribution. None of the standard sizes was eliminated, but the requirements of the jobber and distributor were differently assorted. A more even distribution was accomplished. The total production of lamps is held to be ample, and if the new arrangement is followed out to its logical conclusion, it is said, there is no reason for either a pinch or a stringency at any time anywhere. To be sure, there may be a temporary shortage due to extraordinary conditions, as during the past year. This was occasioned by the extraordinary call for the lamp equipment of cantonments, naval bases, aviation fields, shipyards and other large industrial enterprises developed by the war situation. Then local stocks were rapidly absorbed and in a few instances completely exhausted. Manufacturers have been working along these lines, it is stated, for some time; and, aiming at a more even distribution as a basis, the problem is in a fair way of being rapidly solved.

BOILER MARKET BEST IN THE EASTERN STATES

Business Has Slacked Off in Middle West but Is Expected to Revive Soon—Deliveries Six to Eight Months Without Priority Order

The business in boilers of central-station sizes can at present be divided into three general classifications for analysis. They are, first, commercial business in the district between Pittsburgh and New York; second, commercial business west of Pittsburgh, and, third, marine business. East of Pittsburgh inquiries and orders are being handled in volumes above normal. This is due largely to the great amount of strictly war work in that territory, creating extraordinary demands for power that must be supplied. In the Middle West, where there is less war work, the boiler business, while still good, has fallen off somewhat. The staple buyers of boilers—the central stations—are not in the market for any more equipment than they must of necessity purchase. A better market for boilers in the Middle West is expected to prevail in the coming months regardless of whether the war continues or ends quickly. If the war continues, it seems inevitable that the war business will spread over a wider territory than it now takes in. There are several good fuel fields west of Pittsburgh, and it is believed that the logic of distributing government business more widely, from a geographical standpoint, will become recognized.

This naturally is expected to help boiler business in the Middle West. On the other hand, if the war suddenly stops public-service business is expected to again flourish, since the lack of capital is all that is preventing extensions of plant. The business in marine boilers is so heavy that some of the prominent factories are looking for ways to let the business divided between their competitors rather than trying to do all of the work themselves. On the whole, the boiler manufacturing industry is far behind with its orders. Deliveries on marine boilers are twenty-four months and up; deliveries on commercial boilers are from six to nine months without a priority order. With an -1 priority order a commercial customer might get a delivery in from two to three months.

Some of the boiler manufacturers are taking advantage of the "sellers' market" that conditions have created to put into effect selling policies that they believe are for the ultimate good of customers but which there was no way of enforcing under ordinary conditions. Manufacturers claim that central stations and some industrial plants are not to make the mistake of wanting to install boilers that are too large. No boiler in a plant, say these manufacturers, should be so large that its loss in times of peak load will affect the operation of the plant if it is a station that stands alone, or will affect the operation of the system if it is an interconnected plant. In the past all argument on this effect has had little effect on customers. They thought they knew what they wanted and ought to have. In some cases boilers too large for the plant have been sold with a written protest from the manufacturers as a part of the contract. Nevertheless, this has not prevented the customer from coming back on the manufacturer if the boiler went wrong as was predicted. Nothing seems able to prevent that. So at least one company now is making it an absolute rule not to sell boilers that it knows are too large for the plant in which they are to operate. If it cannot convince a customer that he should buy boilers of sensible sizes, it is willing that some other manufacturer should get the business and stand the future grief.

METAL MARKET SITUATION

Consumption of Copper Falls Off a Trifle—Wire Prices Fixed at Base Figures

During the suspension of business on the fuelless Mondays, now happily abrogated, with the exception of New England, the consumption of copper for civilian purposes has suffered a reduction—just how much is now being figured out. At any rate, the call for the metal, which appears to be in good supply, has shaded off, and industrial consumers are supplying their requirements—in less than for lots—at 24.67½ cents per pound, the government price, perhaps even better. Wire base is unchanged; rubber-covered, cable and weatherproof remain stationary, with probably some slight reduction in the nature of extra discounts under certain favoring conditions.

Straits tin is not to be had—none offering, but Banca, from China, is in fair supply. Prices are very irregular. Lead has moved up a few points; sheet zinc has dropped sharply. The other metals are unchanged.

NEW YORK METAL MARKET PRICES

	Feb. 11			Feb. 18

THE WEEK IN TRADE

WITH the appearance of more favorable weather a more wholesome condition is reported in the electrical trade throughout the country. Freight congestions have by no means been relieved—far from it. The Eastern seaboard and North Atlantic coast cities are still suffering from lack of even reasonable deliveries. The abrogation of the fuel order, with the exception of New England, where the shortage is felt severely, has stimulated trade measurably. The transportation of needful raw material along freer lines has helped factory production.

Nevertheless, electrical goods are moving more easily, and the spirit of optimism is loudly expressed. Concretely, fan order contracts are being signed up on a more liberal basis than last year, lamp cord is in strong demand, porcelain insulators are in better supply. Conduit, while below the normal stock level, is on heavy call, as well as electric tools, floodlamps, wire and second-hand motor installations. A scarcity of large motors is predicted, on account of the extended time delivery. Building operations for January show a falling off of fully 50 per cent as against the same month in 1917.

Collections vary from slow to excellent, according as reports concern different branches of the trade. Credits are being held up firmly.

NEW YORK

So important have become deliveries that the careful buyer is not so much concerned by the price of merchandise as by when he will receive it. Delivery is demanded before quotations are asked, and if there is any uncertainty on this score, the order is withheld for further consideration and for other quotations before it is placed. This situation is said to be affecting the sale of all electrical goods. In addition, both jobbers and dealers are continuing to buy cautiously and not far ahead. Locally jobbers, and in some instances manufacturers, are endeavoring to persuade dealers to handle specific lines exclusively. The proposition is not meeting with much favor, it is intimated, as the retailer contends he should sell what is called for irrespective of the make or brand, unless it is universally recognized as standard by the trade and public. Dealers are quoted as being opposed to doing missionary work in the furtherance of any special electrical merchandise. This, they contend, is a function of the manufacturer or exclusive distributor.

LAMPS.—The situation in lamps is said to be improved by the recent action of the manufacturers in the more even distribution of stocks. A saving of 30 per cent is claimed by some jobbers with the new arrangement.

WIRING DEVICES.—Staple goods in this varied line are reported as being in strong supply by jobbers who specialize on isolated plants and like supplies.

POLES.—While prices remain stationary, the difficulty in obtaining supplies grows steadily worse, particularly for chestnut poles of the 35-ft. size, the popular pole, for which an enormous demand is reported. Stocks are low, but a large quantity is on order. Thirty-foot and 40-ft. poles are being substituted, when accepted, as well as white and Northern cedar. This pertains to the Eastern territory only, against which freights are a drawback. An order for 2200 chestnut poles, shipped out of Chicago stock, may be turned into cedar. The embargoes are working a great hardship.

CONDUIT.—Stocks are low owing to traffic conditions. Prices on conduit are not likely to change, and the situation will doubtless improve with the arrival of more propitious weather and the clearing up of freight congestions.

COLLECTIONS AND CREDITS.—No complaint is heard of slow collections, several jobbers asserting that they

would be too good to believe if the actual settlements had not been really checked up. Little credit is being sought and trade acceptances are slowly but surely working their way into trade favor.

VACUUM CLEANERS.—The Hotpoint division of the Edison Electric Appliance Company, Inc., on Feb. 8 issued the following notice: "Because of continued rising cost of material and labor, it is necessary for us to increase the list price on our model L vacuum cleaner and attachments, also on model M attachments. Beginning March 1 to all classes of trade and consumers our new list will be as follows: Model L vacuum cleaners, \$30; model L attachments, \$8.50; model M attachments, \$8.50. Until March 1 orders will be accepted for the above articles at present lists for shipment as may be specified prior to April 1."

LINE HARDWARE.—Following the making of extremely large purchases of line hardware by the government, distributors are of the opinion there will be a tendency to reduce production for commercial consumption. Pittsburgh mills, which have a large quantity of hardware on order, cannot get goods in this market unless subject to long delays. Primary distributors are therefore buying cautiously from Connecticut producers, and not farther ahead than for a month's anticipated requirements.

CONDULETS.—Reports are that condulets are hard to stock and difficult to obtain, excepting in small quantities, in common with everything in the electrical staple line made of steel. Prices are, however, unchanged.

CHICAGO

"What you can get you can't sell, and what you can sell you can't get." Those words from a prominent manufacturers' agent in the Chicago territory sum up rather exaggeratedly, but to some extent accurately, the general state of the trade. Nevertheless, business continues to be done. It is heard everywhere that if prices were at the same level as they were a year ago the volume would be considerably off. As it is the volume of merchandise moving is less than it was at this time last year, but the value appears to be about equal to what it was a year ago. The meeting of the central division of the Electric Supply Jobbers' Association, with its discussions of war conservations and claims and its election of officers, was the feature of the week.

For the week ending Feb. 13 429 electrical permits, aggregating 5293 incandescent lamps and 576 hp., were applied for at Chicago. For the same week last year 803 permits were used. Building permits for the week ending Feb. 13 totaled twelve and amounted to \$308,600, as against sixty permits amounting to \$831,600 for the same week last year.

MOTORS.—Factories have been notifying certain Chicago agents that motors of 50 hp. and larger will be quoted at 10 months and upward. This indicates a greater scarcity of goods of this kind. War business does not make unusual demands for smaller motors. Immediate deliveries can therefore be made on many sizes and types up to and including 15 hp.

LINE MATERIAL.—The business in pole-line material which is usually anticipated at this time of year, as the result of storms, has in part materialized. Not all of the large stocks laid in to take care of it have been used, however, in spite of the severe weather. This is not regarded as unusual, since the most destructive storms are the sleet storms that usually come later in the year.

PORCELAIN INSULATORS.—The high-tension demand is holding up well, but the electric railway demand is off. Repairs, replacements and a few short extensions are creating the high-tension demand. Some instances in which the need for increased line capacity made it advisable to increase the operating voltages have also resulted in orders. Deliveries are 50 per cent better than last year at this time. Thirty to sixty days are quoted.

DOMESTIC APPLIANCES.—The only complaint concerning business in this field comes from manufacturers whose customers are overstocked. It appears that during the later months of 1917 some dealers were induced to put in very heavy stocks of high-priced goods. In some cases dealers were oversold by manufacturers' representatives

seeking records. High-priced material has not moved as rapidly as cheaper goods.

LAMP-DIMMING DEVICES.—There is an active demand for goods of this class. The business has no abnormal war features, but is of the steady, staple variety.

PORTABLE ELECTRIC TOOLS.—The demand for portable electric tools is brisk, but the production was seriously handicapped by the Fuel Administration's order. One concern which ordinarily produces 5500 tools, of both electric and pneumatic types, a month produced last month only about 3200 tools. This large reduction was caused not only by the fact that the production of this particular plant was affected, but also by the further fact that it was impossible to secure the necessary castings because of delays the foundries suffered in getting raw materials, held up by the fuel order. It is said that this condition prevails in spite of the fact that a very large percentage of the tools on order are to be used in shipbuilding and in all sorts of shipyard construction. This concern is about 10,000 tools behind on its orders.

BOSTON

Continued vigorous activity characterizes the trade, with government work the basis of major undertakings. Retailers report a rather quiet week, but plenty of optimism is in evidence as the winter draws toward its close. Labor-saving equipment seems certain to be in increasing demand, and even the small dealers are featuring washing machines and vacuum cleaners with excellent results. Building operations are very quiet and labor for electrical contractors' employ is rather more plentiful. Prices hold firm, with few changes. Deliveries of electrical equipment and supplies are still very unsatisfactory, but continued open weather is alleviating railroad congestion, and the outlook for improved service this spring is encouraging. Jobbers are well stocked, generally speaking. Collections do not show much change, being slow in the case of the smaller contractors, reasonably satisfactory in central-station circles and excellent in the mills.

The coal shortage remains threatening; New England is suffering severely from shutdowns in industrial war production forced by coal scarcity, and there is much unrest among wage earners thrown temporarily out of work. An eight-million-dollar war-storage terminal, including a dock and warehouse with more than 2,000,000 sq. ft. of floor space, is planned for Boston by the War Department, it is announced.

LAMPS.—Carbon lamps are still short, but central-station men do not appear to be much exercised. Some localities report ample supplies of tungsten lamps, judged by reasonable requirements. The outlook is good for increased production and larger factory stocks this spring. One jobber expects to increase his lamp sales by 100,000 this year, due to consignment contracts and list price sales by local central stations.

MOTORS.—Revamping of motor installations is a developing branch of electrical practice. New munitions contracts almost always force machinery rearrangements, and while the demand is great the supply of motors of smaller sizes is improving in extent and variety. Second-hand motor dealers are working under heavy pressure.

TESTING EQUIPMENT.—Plants making testing specialties for laboratories and meter departments are passing through a season of curtailment in new orders, due partly to shortage of testers. Protracted hostilities will probably lead to the increased employment of women in the testing field. Some foreign business is being handled, notably in South America and New Zealand. A representative specialist producer of artificial loads reports ample stocks of magnet wire and copper, with good labor conditions.

CONDUIT.—Scarcity of larger sizes is a widespread plaint, and shipments are slow and uncertain. Forehanded jobbers' orders are gradually coming in, but the situation cannot be called at all satisfactory.

REFRIGERATING EQUIPMENT.—Prospects are good, inquiries in fair volume, prices steady, labor fairly plentiful and deliveries of eight to twelve weeks possible on important work.

ATLANTA

The recent statement by the Fuel Administration that fuelless Mondays would be abandoned, at least for the present, was cheerfully received in this section. While the Southern States were exempted one week earlier than the Northern States, it was anticipated that a rescinding order would follow to cover any territory affected in the original order. The recent mild weather has greatly relieved the fuel situation and surface conditions appear normal.

The trade in general reports that electrical goods from manufacturers' and jobbers' local stocks to interstate destinations in the Southeast are moving more easily. A marked improvement is also noted in deliveries of goods from a few of the Northern and Eastern points. Large quantities of material had been delayed owing to Eastern embargoes. There is no evidence at this time to indicate that business is slowing up; in fact, all manufacturers and jobbers interviewed are very enthusiastic as to the business for 1918. The increased quotas for early delivery of fans reflects material evidence of actual conditions in this line alone.

Industrial activity continues along shipbuilding, essential and quasi-essential lines. The new government dock yard at Fort Wentworth, Ga., will cost approximately \$5,000,000. The National Ship Building & Dry Dock Company, Savannah, Ga., has secured a three-million-dollar contract for wooden hulls. The Dayton Company, Dayton, Tenn., capitalized at \$4,000,000, will develop iron and coal properties in Tennessee and Georgia. The Cumnock Coal Mining Company, Cumnock, N. C., capitalized at \$1,000,000, will develop coal land. Fabricated steel ships will be constructed by the Pensacola Shipbuilding Company, Pensacola, Fla., plant investment approximately \$700,000.

LAMP CORD.—The demand for all sizes continues strong. Local stocks seem to be holding up well, and a plentiful supply of the standard size is on hand. Factory deliveries are very slow. Special sizes are very hard to obtain.

SWITCHBOARD INSTRUMENTS.—On the whole the demand has been steady, with the exception of spotty large orders placed with equipment. No change in price has been noted for some time. Shipment promises are very good and vary from four to six weeks.

SOCKETS.—The volume of business in this line is large and the demand shows some increase. Stocks are in pretty fair shape.

TRANSIL OIL.—Manufacturers report great difficulty in securing proper quantities to fulfill transformer orders. This situation is mostly due to rail embargoes.

SEATTLE

From present indications February's trade volumes will be much heavier than last month's, which were surprisingly large. Sewing-machine sales featured the week's business, as has been the case for several weeks. Sales of other labor-saving devices are steady but not startling. The volume of sales of electrical equipment and machinery to shipyards and industrials shows a slight increase over the past week. The buying of electrical machinery and equipment for Alaska canneries is at peak and is expected to subside shortly. It has been heavy. Government buying for navy yard and army cantonments has dragged perceptibly. Stocks, with the exception of conduit, rubber-covered wire, lamps and both large and small motors, are in good shape. The freight situation is no better; shipments are dribbling in very slowly. Shipments which heretofore took eighteen days now take five and six weeks. Car shortage is much in evidence, especially in the Puget Sound district. Portland jobbers report a heavy volume of sales the past week, to wooden shipyards particularly. Steel shipyards are buying steadily.

Convinced that further delay in providing housing for shipyard and like war industry workers will cause slowing down of war essential work, the Seattle Chamber of Commerce will ask the government for \$3,000,000 to assist in a home-building campaign. A report to the government states no houses are for rent, a large number being erected for sale only. The residence building boom in Seattle continues, and Tacoma's record for the first eight days of the

month was 35 per cent greater than the entire month last year. One Tacoma capitalist plans to erect 500 homes immediately to handle the influx of workers.

The Seattle headquarters of the Emergency Fleet Corporation has received an order for 15,000,000 ft. of fir to supplement a former order of 50,000,000 ft., to be substituted for Southern pine. The railroads have promised co-operation in making shipments promptly.

The boom in grain elevator construction in eastern Washington and Oregon continues. Orders and inquiries for electrical equipment from this source are increasing daily. Several large orders for motors and lighting equipment were placed the past week. The Alaska Engineering Commission of Seattle has awarded contracts for motors, wire and lamps for government railroads. Additional contracts for like equipment will be let shortly.

Conduit is in slightly increased demand from shipyards; government buying receded slightly. Shipments are highly unsatisfactory, on account of the manufacturers' inability to secure closed cars. Stocks low; prices steady. Several large orders for floodlamps for lighting shipyards in the two shipbuilding cities completely shot stocks to pieces, forcing jobbers to wire Eastern factories for additional supply. Additional orders are at hand. Motor generators are moving as fast as jobbers can get them. Shortage has prevailed for several months.

SAN FRANCISCO

Continued rains have greatly improved prospects in California, and the recent strain on business conditions has eased correspondingly. Hydroelectric companies, however, cannot now expect relief, as it is too late to pack and freeze the snow, the melting of which supplies the later summer flow. Thus facing the necessity for returning early to the use of fuel in standbys, and with oil now at \$1.50 per barrel and likely to go higher, the central stations are applying for authority to increase rates. A strike of electrical workers in Los Angeles and neighboring cities has been averted by arbitration at the last moment. The labor situation, however, is in a somewhat unsettled state.

Within the last few weeks plans for considerable construction activity have been announced. The one-million-dollar contract for the government camp at Riverside has been let on a percentage basis. Engineers are now at work laying out another government camp, including an aviation base, 12 miles from Sacramento, which will have about fifty-two buildings and will cost about \$1,250,000. Work to the value of about \$1,000,000 is under way or will soon be started at San Francisco by the State Harbor Commission.

Freight shipments from the East are now coming through in about twenty-eight days. The Southern Pacific Railroad reports that a system of embargoes has resulted in entirely clearing up the congestion of eastbound freight from San Francisco and Los Angeles.

MOTORS.—One large firm reports a readiness to ship from stock in San Francisco all sizes up to 30 hp. Stocks on hand at the factory in these sizes are considered ample, and the small-motor situation is considered to be excellent, in fact better than has been the case previously for more than eighteen months. Deliveries on sizes from 30 hp. to 50 hp. are slow and above 50 hp. are rather indefinite.

LAMPS.—The general situation has not changed materially. No effect of the heatless Mondays in the East has yet been felt on the coast, but in a few weeks, when there has been time for coast lamp orders to come through, there may be greater difficulty in filling orders. A new lamp factory on the coast is to be in service in a few months, after which the situation is expected to be very greatly relieved.

WIRE.—The demand for both rubber-covered and weatherproof wire is reported as below normal. Prices have not changed. For the most part stocks are in bad shape. The completion of factory extensions and a falling off in this business is given as a reason for the decreased demand. However, considerable government business is in prospect. One firm reports a considerable sale of weatherproof to steam railroads.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements
in Manufacturers' Products Used in
the Electrical Field

Master Switch

The master switch shown herewith has a lever which controls the starting and a press button in the front for stopping. In the running position the starting lever is held by an electromagnet which is in series with the field

WITH LEVER FOR STARTING AND BUTTON
FOR STOPPING

winding of the motor, so that in case of a failure of voltage or a rupture of the field circuit the starting lever automatically flies to the "off" position.

This switch is made by the Igranic Electric Company, Ltd., London, Eng.

Automatic Control for Stationary Vacuum Cleaner

Stationary vacuum cleaners when installed in large apartment buildings, hotels, club houses and halls have hose connections in many locations and switches on each floor to start and stop the cleaner. With such a system an employer or tenant using a cleaner connection on one floor and knowing that others are being used elsewhere in the system depends on the others to close down, with the usual result that the plant continues to run unnecessarily.

The Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has designed a vacuum-cleaner receptacle the

VACUUM CLEANER RECEPTACLE AND
CONTROL

cap of which is attached to the hose, as shown in the accompanying illustration. Inserting the cap in the receptacle closes an auxiliary circuit to the starting equipment. In the case of small stationary outfits in private homes the

cap can be used to close the motor circuit direct. This automatic control insures against waste of electricity and unnecessary operation of the cleaner. These receptacles are wired in parallel so that the insertion of one or more caps will operate the plant. Being chained to the hose, the cap will always be there when the use of the hose is required. The receptacle and cap furnished are of a special design which permits the cap to be readily detached at any angle. No other cap is interchangeable with it, and consequently the receptacle cannot be used for other purposes. The complete device includes receptacle, cap and 14 in. (35.6 cm.) of chain but not the hose clamp.

Meter for Measuring Coke Oven Gas

Increasing quantities of surplus gas from by-products coke-oven plants are being consumed in various processes in steel mills, and it is desirable to have

RECORDING PANEL INSTALLED IN OFFICE

an accurate and reliable measurement of this gas. For this purpose the Thomas meter has been applied, which measures the quantity of gas in standard units, such as cubic feet at 30-60, without any calculations or corrections for pressure and temperature, although these may vary through wide ranges. The total quantities (in cubic feet) are shown on an integrating meter, and the rate of flow is shown graphically on a curve-drawing instrument. The graphic chart obtained from this instrument is very useful to the superintendent of a coke-oven plant, showing him at a glance the amount of gas being used for fuel in the coke ovens over

any period, with variations in quantities clearly indicated.

The meter is installed in a housing which replaces a portion of the gas-pipe line. The principle of the Thomas meter is that it measures the heat capacity of a gas electrically. The amount of electric heat necessary to raise a standard unit 2 deg. is used as a measure of the gas flowing through the meter. The electricity for heating the gas can be conducted on comparatively small wires, consequently the meters showing the amount of gas used can be placed in the superintendent's office or other desired location, which may be several hundred feet from the meter proper. The recording panel is shown herewith as installed in the office of the rolling-mill superintendent of the Brier Hill Steel Company at Youngstown, Ohio. The graphic chart shows at a glance just how much gas is being used at any time in the steel mill. The complete Thomas meter and recording panels are made and installed by the Cutler-Hammer Manufacturing Company of Milwaukee, Wis.

Circuit Breakers

The Roller-Smith Company of 233 Broadway, New York City, has brought out an inclosed-type plain no-voltage circuit breaker. It is pointed out that these breakers are now mounted in inclosing cases. The outfit complete comprises the circuit breaker, the inclosing case, which is provided with wiring inlets at the top and bottom, a convenient handle with which the breaker may be opened by a slight upward pressure or closed with a slight downward pressure, and a target on the left side of the case showing

NO-VOLTAGE INDUSTRIAL-TYPE CIRCUIT
BREAKER WITHOUT INCLOSING CASE

whether the breaker is open or closed. The equipment is offered for 45-amp. and 100-amp. loads and voltages of 110, 220, 312 and 440. Each breaker has one no-voltage coil, which is wound for the voltage specified.

Motor-Driven Sanders

The Electric Specialty Company of Stamford, Conn., has developed the speed sander shown here, which is driven by an alternating-current or direct-current motor. The motors used are said to be dust-proof, with shafts over-

EQUIPPED WITH A MICROMETER ADJUSTMENT

size, running in ball bearings. The steel disks are turned and ground accurately on all surfaces, insuring perfect balance. This machine is equipped with a micrometer adjustment which when turned one space tips the table 0.001 in. on 1-in. (0.0025 cm. on 2.54-cm.) thickness. This is a great convenience in duplicating one bevel against another, it is said. The micrometer also acts as a positive right-angle stop, so that the table can be kept perfectly square with the disk.

Motor-Starting Switches

Motor-starting switches designed for low-voltage and over-load protection are made by the Wells-Morris Manufacturing Company, 90 Second Street, San Francisco, Cal. These switches, equipped with protective plugs (inverse-time-limit design) of proper size, give both inverse-time-limit overhead protection and low-voltage protection.

DESIGNED FOR LOW-VOLTAGE AND OVER-LOAD PROTECTION

They also protect polyphase motors from operating single-phase. The switches are furnished with left-hand threaded receptacles to receive the protective plugs.

These switches are quick-break, opening by gravity, spring-assisted. Each pole has two breaks in series and wiping contacts with a special member to take the arc. The contacts will not freeze closed, it is claimed. They open automatically when the power is interrupted or if a protective plug blows, giving absolute protection against overload and single phasing. The low-voltage release coil uses only a small amount of energy and is positive in its method of operation.

Reverse Phase Relay

Reverse phase relays for the protection of elevators, cranes, conveyors, textile machinery, etc., are sold by the Philadelphia Electric Company Supply Department of Philadelphia, Pa. The complete equipment consists of the relay and a double-pole circuit breaker equipped with a shunt trip coil only. The relay is a potentially operated device, consuming but a negligible amount of energy.

The electrical elements consist of two laminated iron electromagnets, the coils of which are connected to opposite phases of the supply circuit. A vertical shaft supported by bearing pivots carries two aluminum sectors,

RELAY WITH CASING REMOVED

which are partly inclosed by air gaps in the magnetic circuit. The magnets are so placed that when energized from a polyphase circuit a rotating field is produced. This field, acting upon the sectors, causes the latter to rotate in a direction dependent upon the phase rotation of the supply circuit. A contact attached to the shaft and receiving the current through a flexible connection completes the trip-coil circuit of the accompanying circuit breaker when the direction of phase rotation is of such a kind as to cause the relay to operate.

The relay may be supplied to either close or open a circuit, such as that supplying the no-voltage release coil of an oil switch or circuit breaker. The device is mounted in a substantial dust-proof iron case, with sealable wing nuts, and terminal chamber having binding posts for the connection leads.

This relay is designed for use on two-phase or three-phase, three-wire or four-wire, 25-cycle or 60-cycle circuits,

and will be furnished for 110, 220, 330, 440, 550 and 600 volts service.

The circuit breakers furnished with these relays are of special design either of a totally inclosed oil type or of a plunger type with iron inclosing box with relay mounted thereon. The capacity of the breakers has been standardized at 100 amp. and 220-600 volts, which at the 220-volt rating will take care of motors up to and including those of 30-hp. capacity. Larger capacity circuit breakers can, however, be furnished.

Pipe Vise

The pipe vise shown herewith is a simple, portable vise which can be moved from one location and mounted at another in a moment's time. It fastens to any kind of a horizontal or vertical support, whether round, square or flat, without the use of bolts. It locks any size of pipe or conduit within its limits by the slight push of a lever. No previous adjustment is necessary.

The base support is squared out in the form of an inverted V, at the sides of which are bolt lug feet, to be used only in case the vise is to be permanently bolted in one position. Hence it will conform to a round, square or flat surface. A clamp support on the opposite side of the column is a part of the equipment. It is a bell-section shape, having a boss at the top, through which a threaded supporting eye-bolt passes free. A heavy nut resting on the top of the boss and engaging the threaded eye-bolt adjusts the tension of the chain passing through the eye of the eye-bolt. The base of the clamp support is squared out in a manner similar to the vise base in such a way that it fits the same shaped surfaces.

A heavy wrought-iron chain is riveted on one side of the vise base. It passes around the supporting column, through the eye of the eye-bolt in the clamp support, and thence to the other side of the vise base, a link being held securely in position in a socket. Tightening of the eye-bolt nut tightens the

VISE IS PORTABLE

supporting chain and holds the vise rigidly in position.

The Gerolo Manufacturing Company, Old Colony Building, Chicago, is the manufacturer.

Trade Notes

L. L. FLEIG & COMPANY, INC., of Chicago announces that it has raised its capital stock from \$30,000 to \$50,000. The company handles electrical insulating materials.

M. V. STAIG, formerly with the Fort Wayne & Northern Indiana Traction Company, is now manager of the appliance sales department for the F. Bissell Company, Toledo, Ohio.

THE WAGNER ELECTRIC MANUFACTURING COMPANY of St. Louis, Mo., has insured its 3,000 employees, up to \$1,000 each, for 1918. The company pays the premium on the entire amount of insurance.

J. KING WALLACE, formerly with the Continental Fibre Company, is now district manager for the Consumers' Rubber Company, Cleveland, Ohio, covering the States of New York, Pennsylvania and Maryland.

HOWARD DINGLE and W. W. Clark, formerly manager and assistant manager of the Crocker-Wheeler Company, Amper, N. J., have formed the Dingle-Clark Company, contracting engineers, with headquarters at 536 Engineers' Building, Cleveland, Ohio.

S. M. MOORE, for six years in the New Haven (Conn.) office of the General Electric Company, has joined the staff of the New England Engineering Company of Waterbury, Conn. He has been placed in charge of office work in connection with motor and apparatus sales.

THE GENERAL ELECTRIC COMPANY of Lynn, Mass., on Feb. 5 distributed bonuses to about 13,000 employees who have worked continuously for it for five years. Five per cent of the total earnings of the past six months was paid, and the total amount disbursed was about \$100,000.

SCHWEITZER & CONRAD, INC., of Chicago, has recently appointed the Franklin Sales Company, Denver, Col., district representative for Wyoming, Colorado, New Mexico, Arizona, Utah, the western portion of Nebraska and the eastern portion of Montana and Idaho. The Franklin company will sell the entire line of S. & C. protecting and switching devices.

THE NATIONAL X-RAY REFLECTOR COMPANY of Chicago has appointed G. F. Evans supervising engineer in the territory comprising the State of Ohio (except Toledo and Cincinnati), West Virginia and Western Pennsylvania. Mr. Evans is established at 825-826 Columbus Savings & Trust Building, Columbus, Ohio. He was formerly connected with the W. C. Moore Company of Columbus.

CHARLES H. KEELING, after years of experience in the electrical field, has joined the selling forces of the Square D Company of Detroit, Mich., and will travel in the Canadian territory, with headquarters at Toronto. He was formerly connected with the Renfrew Electric Manufacturing Company, Ltd., Renfrew, Canada, being its first sales representative. In 1916 Mr. Keeling was appointed sales and advertising manager of that company.

THE DE LA VERGNE MACHINE COMPANY of New York City, since its control by the William Cramp & Sons Ship & Engine Building Company, because of the large amount of turbine work, will somewhat curtail its oil-engine and ice-machine business. The company states that for ice machines there is little or no outlook for the next year or more, as the government is conserving the ammonia supply to the extent of not permitting its use in new plants.

HICKEY & SCHNEIDER, INC., New York City, manufacturer of transmission-line equipment, heretofore a partnership, is now to be continued as a corporation, capitalized at \$100,000, according to a statement made by Mr. Schneider, president of the concern. P. Kovac, formerly with the New York Edison Company, is sales engineer in charge of the company's sales and service departments. P. S. Houton, an engineer of broad experience, is to handle the design work.

EARL E. EBY, manager of the industrial bearings division, Pittsburgh office of the Hyatt Roller Bearing Company of Newark, N. J., for the past two years, has been appointed assistant sales manager, with offices in the Metropolitan Tower, New York City. Mr. Eby is a graduate engineer from the Ohio State University and previous to his connection with the Hyatt company spent four years in the engineering department of the Westinghouse Electric & Manufacturing Company.

THE NATIONAL X-RAY REFLECTOR COMPANY as the result of a suit brought in the United States District Court, southern district of New York, against the Stronksy Manufacturing Company, for infringement of the "X-ray" trade mark by putting out a lighting fixture called the "X-Ray Lite," has received a decree holding the X-ray trade-mark good and valid and granting a perpetual injunction restraining the defendant from infringing it.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., will remove its automobile equipment department manufacturing operations to the company's Newark (N. J.) works. At these works the Westinghouse company has for many years been manufacturing small motors and instruments of accuracy and precision. Its facilities and staff assure a continuation of the present high quality of the automotive equipments. At the same time the general sales offices of this department will be moved to 110 West Forty-second Street, New York City, where the Eastern district sales office will also be. S. D. Levings has resigned as Eastern representative of the automobile equipment department.

THE SQUARE D COMPANY of Detroit, Mich., held its first annual sales convention at the Hotel Statler Jan. 10, 11 and 12. It was attended by the company representatives from coast to coast and members of the advertising and home sales force. Bryson D. Horton, president of the company, made the opening address; A. MacLachlan, sales manager, gave a talk on "The Industrial Plant"; L. D. Calhoun, advertising manager, and G. H. Eddy, with the ELECTRICAL WORLD, also spoke on timely topics. A dinner tendered by President Horton was given the guests on the evening of the 11th at the Detroit Athletic Club. A trip of inspection through the plant was made the following day.

Trade Publications

FANS.—The Carleton Company, 170 Summer Street, Boston, Mass., is distributing a leaflet descriptive of its fans for the 1918 season.

FANS.—The Hamilton-Beach Manufacturing Company of Racine, Wis., has prepared a leaflet descriptive of its Cyclone universal fan.

FANS.—The Pittsburgh Electric Specialties Company, 396 Broadway, New York City, has prepared a leaflet descriptive of fans for 1918.

CIRCUIT BREAKERS.—The Cutter Company of Philadelphia is distributing a calendar. Various interesting information and data regarding this company's line of circuit breakers are included in this calendar.

FANS.—The Robbins & Myers Company of Springfield, Ohio, has prepared its catalog No. 1117, descriptive of its electric fans for alternating-current and direct-current circuits, including non-oscillating, oscillating, ceiling and ventilating fans and hat cleaning motors.

ILLUMINATING GLASSWARE.—The Phoenix Glass Company, 230 Fifth Avenue, New York City, is bringing out a monthly publication to be known as the *Illuminator*, which will deal mostly with matters pertaining to illuminating glassware. All new designs will be shown on perforated and punched pages which can be easily removed and filed away in a loose-leaf data book. This will permit all the new designs to be kept together and will not require the going over of the files of the *Illuminator* each time reference is to be made. All changes in discounts, package charges, etc., will be noted. Articles by fixture manufacturers and illuminating engineers on various problems that they have actually met and solved will be featured. In this first issue an article on a new cost system installed by Cassidy & Son Manufacturing Company contains much information that is valuable to the fixture manufacturer. Articles will be published by the leading designers in the country on various subjects dealing with the artistic features of glassware and fixtures.

STEAM TURBINES.—Interesting applications of steam turbines in naval public utility and industrial service are illustrated in bulletin 242, just issued by the Terry Steam Turbine Company of Hartford, Conn. In this twenty-eight-page publication the advantages of turbine drive for auxiliaries are featured, followed by a clear-cut description of the Terry wheel and principle of operation, with diagrammatic explanation of the action of steam, reasons for selecting this product and a condensed engineering discussion of eleven cardinal points

in design. A full-page illustration of labeled turbine parts is included, and an interesting diagram is added showing the relative water rates with and without the use of partial nozzle control. The principal engineering features bearing upon turbine selection are set forth in simple terms easily understood by the industrial executive and sufficiently complete in detail to interest the technical reader. Shaft whipping, maintained alignment, handling fractional loads efficiently, low upkeep cost and reliability are a few of the points discussed. Applications of the vertical type of unit used for the past decade on United States destroyers, late advances in turbines giving various classes of pumping service handled by this equipment, generating units, duplex exciters and fans of the turbine-driven type are featured in the bulletin.

New Incorporations

THE GENERAL UTILITY COMPANY of Dunn, N. C., has been chartered with a capital stock of \$100,000 by B. O. Townsend, Marvin L. Wade and G. M. Tilghman.

THE DOMESTIC ELECTRIC APPLIANCE COMPANY of Peoria, Ill., has been chartered with a capital stock of \$25,000 by R. B. Cherry, V. E. Hopkins and E. G. Kuecks.

THE COMMONWEALTH WATER & ELECTRIC COMPANY of San Benito, Tex., has been incorporated with a capital stock of \$30,000 by John T. Lomax, W. D. Carpenter and S. Spears.

THE GOWER-MASON ELECTRIC COMPANY of Greenville, S. C., has been incorporated with a capital stock of \$35,000. The officers are: DuPont Guerry, Jr., president, and R. S. Huntington, secretary and treasurer.

THE LANDIS ELECTRIC COMPANY of San Diego, Cal., has been incorporated by H. G. Landis, Edward Jewell and Arthur J. Simpson. The company is capitalized at \$25,000 and proposes to manufacture electrical specialties.

THE HYLE ELECTRIC SERVICE, Inc., of Buffalo, N. Y., has been incorporated with a capital stock of \$3,000 by Howard D. Hyle, Irving R. Templeton and J. Francis Carter. The company proposes to manufacture storage batteries.

HUNTING & GUERRY of Greenville, S. C., has been chartered with a capital stock of \$50,000 to do an electrical contracting business. The officers are: R. S. Huntington, president, and DuPont Guerry, Jr., secretary and treasurer.

THE MONTEREY (IND.) LIGHT & POWER COMPANY has been incorporated by Charles M. Stern, William H. Vandenberg and V. H. Surghnor. The company is capitalized at \$60,000 and proposes to distribute electricity for lamps and motors.

THE BENSON ELECTRIC COMPANY of New York, N. Y., has been chartered with a capital stock of \$250,000 by H. S. Leman, R. Goldman and A. H. Bloch, 507 Westminster Square, Brooklyn, N. Y. The company proposes to manufacture specialties.

THE HOME ELECTRIC COMPANY of Hendersonville, N. C., has been incorporated with a capital stock of \$500,000 to construct and operate interurban railways. The incorporators are: William H. Oates, Claudia H. Oates and Anne Oates, all of Hendersonville.

HESS & HICKS, Inc., of New York, N. Y., have filed articles of incorporation with a capital stock of \$5,000 for the purpose of doing a general electrical and mechanical engineering business. The incorporators are: Julia F. Hess, Frank F. Hess and Gary Hicks.

THE F. D. SCHUSSLER MANUFACTURING COMPANY of New York, N. Y., has been incorporated by F. D. Schussler, T. C. Miller and T. Moran, 259 Eighty-first Street, Brooklyn, N. Y. The company is capitalized at \$100,000 and proposes to manufacture tools, electrical goods, etc.

THE REMINGTON ELECTRIC WELDER COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$300,000 to manufacture electric welders. The incorporators are: Martin E. Smith, Artemus Smith, M. E. Doto, all of Wilmington, Del.

THE WELLES-KINTO CLOCK COMPANY of Philadelphia, Pa., has been incorporated with a capital stock of \$100,000 by F. R. Hansell, Land Title Building, Philadelphia, and S. C. Seymour of Camden, N. J. The company proposes to manufacture motor-driven clocks and other automatic equipment.

New England States

PITTSFIELD, MASS.—Arrangements are being made by John F. Cooney, owner of the Union Square Theater, for the installation of an electric-light and power plant. Contract has been placed for a 200-amp. Westinghouse electric generating unit.

SPRINGFIELD, MASS.—The question of petitioning the State Legislature for authority to develop the water power of Little River to supply electricity for municipal purposes is under consideration by the City Council.

NEW LONDON, CONN.—The Standard Brass & Copper Tube Company, Woodbridge Street, is installing a new power plant in connection with an addition to its rolling mill.

Middle Atlantic States

ALBANY, N. Y.—Plans are being considered by the Esco Electric Company for rebuilding the portion of its plant at 368 Broadway, recently destroyed by fire, causing a loss of about \$75,000. The new building will cost about \$50,000.

AUBURN, N. Y.—Plans have been prepared by the New York Telephone Company, 15 Dey Street, New York, N. Y., for the construction of a new telephone exchange building on South Street.

BROOKLYN, N. Y.—Charles Pfizer & Company of Brooklyn are planning to erect a one-story boiler house, to cost about \$15,000, at their works at 11 Bartlett Street.

BROOKLYN, N. Y.—Application has been made by the Kings County Electric Light & Power Company to the Public Service Commission for permission to issue \$1,000,000 in bonds, to provide for extensions, improvements, etc.

BROOKLYN, N. Y.—The Krantz Manufacturing Company, Seventh Street, near Second Avenue, manufacturer of electrical supplies, has filed plans and awarded contract to the Werner-Huberty Company, 50 Court Street, Brooklyn, for erection of an addition to its plant to cost about \$35,000.

BROOKLYN, N. Y.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25, under specifications (No. 2826) for installing an electric elevator and dumbwaiter at the naval hospital at the Brooklyn Navy Yard. The cost is estimated at \$6,500. Bids will also be received at the same time under specifications (No. 2825) for a diet kitchen and refrigerating equipment at the naval hospital, Brooklyn.

BROOKLYN, N. Y.—The United States government has leased property, consisting of a tract bounded by Second and Third Avenues, Twenty-ninth and Thirty-second Streets, South Brooklyn, from the Bush Terminal Company and the city of Brooklyn, on which it will erect several large factories for the manufacture of products for army service. Plans, it is said, are being prepared for the construction of two initial buildings, each eight stories, U-shaped, about 200 ft. by 75 ft., with 75-ft. wings. Warehouses will also be built for shipping service.

GREENWICH, N. Y.—Application has been filed with the Public Service Commission by the Consolidated Electric Company of Greenwich for permission to construct and operate an electric-light plant in Northumberland. The company proposes to construct an electric transmission line, 3 miles long, from the Northumberland Bridge through Bacon Hill and along the highway leading from Bacon Hill to Grangetown. The necessary local franchises have been obtained by the company.

LONG ISLAND CITY, N. Y.—Plans have been filed by the Astoria Light, Heat & Power Company for the erection of a new plant, 44 ft. by 175 ft., on Winthrop Avenue, to cost about \$20,000.

NEW YORK, N. Y.—Ernest & Herman Levy, Fourth Avenue and Nineteenth Street, it is reported, are planning to erect a new power plant in connection with their proposed new silk mill, to be located at Purdy and O'Dell Streets. The cost of the entire project is estimated at \$75,000.

NEW YORK, N. Y.—Preparations are being made by the West Virginia Pulp & Paper Company for extensions to its different plants, involving an expenditure of about \$1,000,000. Contract has been awarded by the company for the construction of eight new buildings at Tyrone, Pa., to form a new unit for the present works there. At Piedmont, Va., a similar plant will be erected by the company, at a cost of about \$300,000 and four new buildings will be built at its Mechanicsville, N. Y., plant.

ROCHESTER, N. Y.—The Wheeler-Green Electric Company has filed notice

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

with the Public Service Commission of an increase in capital stock from \$100,000 to \$500,000, to provide for extensions, etc.

ROCHESTER, N. Y.—Preliminary plans are being prepared by F. L. Raschig of Cincinnati, Ohio, for the city of Rochester for the construction of an electric railway (8 miles long) through the old bed of the Erie Canal, to cost about \$8,000,000.

WATERVILLE, N. Y.—The Village Trustees have awarded the Waterville Gas & Electric Company a contract for lighting the streets of the village for a period of two years and 11 months. Under the terms of the new contract the company is to install 40 Mazda lamps, 20 of 100 cp. and 20 of 250 cp.

CAMDEN, N. J.—The construction of a municipal electric-light plant is being considered by the city officials.

CLOSTER, N. J.—The Rockland Electric Company of New Jersey has been granted permission by the Board of Public Utility Commissioners to issue \$80,000 improvement gold notes.

DOVER, N. J.—The New Jersey Power Company has secured a contract to supply energy to operate the plant of the Somerset Stone Crushing Company (replacing steam power) at Bernardsville. About 60 hp. in motors will be required.

NEWARK, N. J.—Plans have been filed by the General Lead Batteries Company, 4 Lister Avenue, for the construction of an addition, 50 ft. by 80 ft., at its plant.

NEWARK, N. J.—A permit has been taken out by the Butterworth-Judson Corporation, Avenue R, for the construction of a one-story boiler plant addition, 55 ft. by 110 ft., to cost about \$25,000, at its chemical works.

NEWTON, N. J.—The Town Committee is considering making improvements to the fire-alarm system.

POMPTON LAKES, N. J.—Plans are being considered by the Board of Education for the immediate installation of new electric-lighting systems throughout the school buildings.

TRENTON, N. J.—Plans are being considered for the installation of a new refrigerating plant at the New Jersey State Hospital at Morris Plains, for which bids will be received until Feb. 26. Francis H. Bent is state architect.

TRENTON, N. J.—Plans are being prepared for the installation of a new power plant to cost about \$15,000, in connection with the construction of the first unit of the proposed new general hospital. William A. Kleman is city architect.

WEST NEW YORK, N. J.—The Town Council is considering a bond issue of 150,000 for the installation of a municipal electric-light plant.

BIRDSBORO, PA.—The Birdsboro Electric Company is erecting a high-tension transmission line to the mines of the Brooke Iron Company at French Creek to supply energy to operate machinery in the mines there.

CARLISLE, PA.—Plans are being considered by the City Council for improvements to the fire-alarm system.

CLINTON HEIGHTS, PA.—Plans have been prepared by the Kent Manufacturing Company for the construction of a steam-driven electric power plant, one story, 40 ft. by 68 ft., to cost about \$50,000.

DERRY, PA.—The plant of the Pittsburgh High Voltage Insulator Company was badly damaged by fire recently. The company manufactures high-tension insulators, etc.

ERIE, PA.—An ordinance providing \$22,500 for completing the conduit system and the new lighting system along State Street has been submitted to the City Council. The conduits will be placed on State Street with extensions out Twelfth Street to Walnut and Front Streets to connect with the new plant of the Erie Light Company.

GROVE CITY, PA.—Plans have been filed by the Grove City Creamery Company for the construction of a new plant and power house, to cost about \$35,000. Contract has been awarded to Rose & Fisher, 1719 Pennsylvania Avenue, Pittsburgh.

HARRISBURG, PA.—Notice has been filed with the Public Service Commission by the Juniata Public Service Company of an issue of \$300,000 in bonds. This com-

pany recently acquired a number of electric companies operating in the Susquehanna and Juniata Valleys.

HARRISBURG, PA.—The Harrisburg Railways Company is planning to place its new substation in operation soon to provide power for its Second, Third and Fourth Street traction lines. Three new large transformers will be installed immediately to utilize energy from its York Haven plant.

PHILADELPHIA, PA.—Contract has been awarded by the Bell Telephone Company for proposed alterations and improvements in its building at Eleventh and Filbert Streets to Albert Zellfelder of Philadelphia.

PHILADELPHIA, PA.—Contract has been awarded to F. B. Davis of Philadelphia by Shane Brothers & Wilson Company, Sixty-third and Market Streets, for the construction of a new power house, 35 ft. by 45 ft., at its plant.

PHILADELPHIA, PA.—Plans are being prepared by Andrew J. Sauer & Company of Philadelphia for the construction of a power house to be erected by I. S. Leberman at his plant in the Kensington district, to cost about \$10,000.

READING, PA.—The Metropolitan Electric Light Company is extending its electric transmission lines from the Birdsboro Stone Company at Six Penny to the French Creek Mines.

TRAPPE, PA.—The Borough Council has awarded the Counties Gas & Electric Company of Norristown a contract to supply an electric street-lighting service in the borough of Trappe.

WILLIAMSTOWN, PA.—Notice has been filed with the Public Service Commission by the Lykens Valley Light & Power Company of an issue of \$15,000 in bonds, the proceeds to be used for improvements.

DOVER, DEL.—Plans have been prepared for alterations and extensions to the local plant of the Diamond State Telephone Company.

MONKTON, MD.—The construction of a hydroelectric power plant on Gunpowder River, to cost about \$25,000, to furnish power to operate the proposed flour mill to be erected for the Monkton Roller Mills, is under consideration. The plans provide for the construction of a dam and power house to develop about 100 hp. Otis E. McCoy of Mount Washington is president.

CHARLESTON, W. VA.—Plans for the reconstruction of the boiler house at the State University at Charleston, which was recently destroyed by fire, are under consideration by the trustees of the university.

WHEELING, W. VA.—The car barns and rolling stock of the Wheeling Traction Company were destroyed by fire recently, causing a loss of about \$200,000.

WARRENTON, VA.—The Warrenton Electric Light & Ice Company is changing its plant from direct to alternating current. Two small direct-current generators have been taken out and two alternating-current generators having a total capacity of 90 kw. have been installed. M. J. O'Connell is manager.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25, under specifications (No. 2822) for electric-light and power system at Anacostia, D. C., to cost about \$16,000.

WASHINGTON, D. C.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until March 1, for furnishing and installing lighting fixtures in the United States post offices at Aledo, Ill.; Altus, Okla.; Berwick, Pa.; Butler, Mo.; Cambridge, Md.; Cherryvale, Kan.; Durant, Okla.; Fitzgerald, Ga.; Gallatin, Tenn.; Glenwood, Iowa; Hoopesville, Ill.; Indiana, Pa.; Marion, Ill.; Monessen, Pa.; Olney, Ill.; Sanford, Fla.; Vernon, Tex.; Waynesboro, Va.; Willow, Cal., and the United States post office and court house extension at Oklahoma City. Specifications may be obtained at the above office.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Brooklyn, N. Y., Schedule 1685—12,000 ft. lead and armored, interior communication cable, 90,000 ft. lead and armored single-conductor wire. Puget Sound, Wash., Schedule 1684—50 portable ventilating sets; Schedule 1682—50,000 ft. lighting and power wire; Schedule 1685—5000 ft. lead and armored two-conductor lighting and power wire. Various, Schedule 1688—Miscellaneous hard spring brass wire, miscellaneous soft copper wire, miscellaneous phosphor-bronze wire. Applications for proposal blanks should designate the schedule desired by number.

North Central States

BUENOS, OHIO.—A committee has been appointed by the Chamber of Commerce to look into the matter of establishing another power plant in Bucyrus.

ST. PARIS, OHIO.—An election will soon be called to submit to the voters the proposed to issue \$5,500 in bonds for improvements to the electric-light plant.

SPRINGFIELD, OHIO.—Work, it is reported, will begin on the construction of a large power plant and storage house at the plant of the Robbins & Myers Company, to cost about \$100,000. It will be located on Nelson Street about 750 ft. from the main factory.

WILLARD, OHIO.—Contract has been awarded for a 150-kva., 60-cycle alternator, directly connected to a Chuse non-releasing Corliss engine for the municipal electric-light plant. R. D. Smith is superintendent and electrician.

WINCHESTER, KY.—The city of Winchester is contemplating equipping its proposed new water-works system with electrically operated machinery, for which plans are now being prepared. A committee will soon be sent to Washington to negotiate with the United States government for a permit to install water turbines at Lock No. 10 on the Kentucky River, to develop power to operate the pumps and machinery in the plant.

JEFFERSONVILLE, IND.—Plans are under consideration for rebuilding the State Reformatory at Jeffersonville, of which a large part was destroyed by fire on Feb. 6, causing a loss of between \$500,000 and \$750,000, including trade shops, raw and finished materials, machinery, etc., refrigerating plant, shoe shops, and several other departments. The work will be held up until money can be appropriated.

WASHINGTON, IND.—Plans are being considered for changing the system of the Electric Works to single-phase, 60 cycles. W. J. Perrine is superintendent.

LINCOLN, ILL.—A generator to furnish electricity for the Lincoln municipal railway. It is reported, is to be installed in the plant of the Lincoln Water & Light Company.

SYCAMORE, ILL.—The Geneva Lake, Sycamore & Southern Railway Company, which proposes to build an electric railway from the south shore of Geneva Lake, through McHenry, DeKalb, Kendall and La Salle Counties, has been granted a license to incorporate. The company is capitalized at \$150,000 and has its main office at Sycamore. For further information address A. E. Hammersmith.

BLOOMER, WIS.—At an election held recently the proposal to purchase the electric plant of the Bloomer Electric Light & Power Company, to be owned and operated by the municipality, was carried.

OMRO, WIS.—The Wisconsin Power, Light & Heat Company of Milwaukee has purchased the property of the Omro Electric Light Company and contemplates extending the Kilbourn and Prairie du Sac transmission lines from Markesan to Berlin and thence to Omro this summer. E. B. Heimbach is division superintendent.

ORFORDVILLE, WIS.—The Orfordville Light & Power Company is considering the erection of an electric transmission line (4½ miles long) to a nearby town. The proposed line will be three phase, 60 cycles, 6600 volts, and will have a carrying capacity of 60 kw. A. E. Tomlin is secretary and manager.

POYNETTE, WIS.—The local electric-light plant, owned by Perry Speed, it is reported, has been purchased by L. M. Libby of Glenwood, Wis.

BOONE, IOWA.—The contract for electric wiring the County Home at Boone has been awarded to the Beck Electric Construction Company of Minneapolis, Minn., at \$1,923.

DAVENPORT, IOWA.—The contract for electric wiring the intermediate school at Davenport has been awarded to the Standard Electric Company of Clinton, Iowa. The cost of the building is estimated at \$176,000.

ELKADER, IOWA.—Improvements are being made to the system of the Standard Telephone Company, including the installation of underground cables and an aerial cable, to cost about \$13,000. About 20,000 ft. of wire will be required.

LORIMER, IOWA.—The Board of Railroad Commissioners has granted the Lorimer Light & Power Company a 25-year franchise to erect and operate an electric transmission line upon certain roads and highways in Union County for the distribution of electricity for lamps and motors.

WATERLOO, IOWA.—The Citizens' Gas & Electric Company of Waterloo has been granted a franchise by the Board of Rail-

road Commissioners to erect and operate an electric transmission line for the distribution of electricity for lamps and motors over certain roads and highways in Black Hawk County for a period of 25 years.

KANSAS CITY, MO.—The Interurban Central Station Company is contemplating the construction of a new interurban station on McGee Street, between Ninth and Tenth Streets.

KANSAS CITY, MO.—In a report submitted by Burns & McDonnell, consulting engineers, the proposal to install electric generating equipment at the Turkey Creek pumping station was declared feasible and economical. The cost of the proposed electric-lighting plant is estimated at approximately \$750,000, and it would serve, it is stated, adequately the territory between Twelfth and Thirty-first Streets and Main Street to the State line.

OSARK, MO.—The Finley Light Company, recently incorporated, has taken over the plant of the Water Power Light Company and is changing the system from 60 cycles to 25 cycles and will connect with the transmission system of the Ozark Power & Water Company, which passes the plant. When connections are made a 24-hour service will be established. George T. Breazeale is secretary and manager.

ST. LOUIS, MO.—The Harry Benjamin Equipment Company, Central National Bank Building, it is reported, is in the market for a 250 to 300-kva., three-phase, 25-cycle, alternating-current transformer.

ST. LOUIS, MO.—Plans have been prepared for the erection of a new telephone exchange building for the Southwestern Telephone Company at Delmar and Lake Avenues, to cost about \$85,000. L. R. Timlin is architect.

MADDOCK, N. D.—Plans are being prepared by W. E. Skinner, engineer, Minneapolis, Minn., for the installation of an electric-lighting system, to cost about \$7,000.

NOME, N. D.—The installation of an electric-lighting system in Nome is under consideration by the City Council.

SHARON, N. D.—The local electric-light plant has been taken over by the village of Sharon, to be owned and operated by the municipality.

ARMOUR, S. D.—The South Dakota Light & Power Company is completing an addition to its power house, 45 ft. by 60 ft., and is installing a 300-hp. Smith gas producer. The company has purchased a 300-hp. Rathburn-Jones gas engine together with an additional Smith gas producer of 300 hp. The delivery of the new equipment is expected about May 1. A 90-hp. Munzell engine, formerly used at the Platte station, is now being installed. J. F. Cameron is vice-president and manager.

BRANDON, S. D.—The plant of the Brandon Electric Light Company has not been operated since last September. The question of securing power from the plant at Sioux Falls is under consideration. L. D. Kepple is treasurer of the Brandon Electric Light Company.

CENTERVILLE, S. D.—The Centerville Milling Company has completed the construction of a new dam and wheel pits. Later the company will install a new water wheel. A. J. Struble is manager.

MITCHELL, S. D.—Plans, it is reported, have been prepared by Burns & McDonnell, consulting engineers, Kansas City, Mo., for improving the lighting and water systems. R. E. Davis is city auditor.

STEVENS, S. D.—Contract has been awarded by the Alfalfa Products Company to the Younglove Construction Company, United Bank Building, Sioux City, Iowa, for the construction of an alfalfa products plant at Stevens, to cost about \$100,000. The proposed plant will be equipped for electric-motor drive. Dale C. Koon, 4201 Garretson Avenue, Sioux City, Iowa, is president. Stevens has not a post office.

ALLEN, NEB.—Bids will be received by the Board of Education, District No. 70, Dixon County, Allen, Neb., until Feb. 27 for construction of high school building. Separate bids to be submitted for electric wiring, heating and plumbing and ventilating. Plans and specifications are on file in the office of the secretary of the Board of Education, Allen, and at the office of R. A. Bradley & Company, architects, Exchange National Bank Building, Hastings, Neb.

DALTON, NEB.—Bids will be received by the city of Dalton until Feb. 26 for one 75-hp. and one 30-hp. special oil engine, complete with compressor tank, and one 50-kva. and one 30-kva. generator.

FALLS CITY, NEB.—Bids will be received by the city clerk, Falls City, until March 4 for equipment for the electric-light plant and water-works system as fol-

lows: One 12-in. by 24-in. by 36-in. cross compound Corliss engine; one 16-in. by 32-in. by 36-in. cross compound Corliss engine; one 225-kva., three-phase, 60-cycle, 2300-volt generator; two surface condensers with auxiliaries, one eight-panel switchboard, two 16-kw., 6.6-amp. constant-current transformers and one 750-gal.-per-minute pump with motor. Specifications are on file in the office of the city clerk, Falls City, and may be obtained at the office of the engineers, E. M. Stevens & Company, 708 Ridge Arcade, Kansas City, Mo.

FIRTH, NEB.—Arrangements are being made for improvements to the electric-light plant, including the installation of a 25-hp. gasoline engine, one 16-hp. oil engine and a 15-kw. direct-current generator. Bids, it is understood, have been received for the proposed equipment.

GRANT, NEB.—Bids will be received by the Commissioners of Perkins County, Grant, until March 4 for construction of a high school building. Separate bids to be submitted on plumbing, heating and ventilation and electric wiring. Plans and specifications are on file in the office of H. E. Pankonin, chairman, Grant, and at the office of R. A. Bradley & Company, architects, Hastings, Neb.

BEAVER CROSSING, NEB.—Bonds to the amount of \$9,000 for the installation of an electric-lighting system have been sold.

DOWNER, KAN.—The United Telephone Company is contemplating the erection of a telephone exchange building, to cost about \$15,000. C. S. Brown of Abilene, Kan., is general manager.

EUREKA, KAN.—Bids will be received by J. W. Kenner, city clerk, Eureka, until Feb. 27 for improvements to water-works system, including construction of water-filtration plant, water-works improvements and two 400-gal.-per-minute vertical centrifugal pumps and motors. Plans and specifications are on file in the office of the city clerk, Eureka, and at the office of Black & Veatch, engineers, Inter-State Building, Kansas City, Mo.

MULVANE, KAN.—The boiler room and refrigerating plant of the Helvetia Milk Condensing Company's plant was recently destroyed by fire, causing a loss of about \$20,000.

PITTSBURG, KAN.—Work will begin at once on the construction of the addition to the Normal School at Pittsburg, to cost approximately \$200,000. Bids, it is reported, will soon be asked on heating, electric wiring, plumbing, etc. J. M. Leeper of Topeka has the general contract for the work. R. L. Gamble, Topeka, is state architect.

WICHITA, KAN.—Bids will be received at the office of the secretary of the Board of Education, Wichita, until March 11 for the erection of two school buildings, one to be the South Side Intermediate, located on Zimmerly Street, between Market and Lawrence Streets, and the other, the Skinner School, to be located at the corner of Twenty-first and Hydraulic Streets. Separate bids for heating and ventilating system and electric wiring will be received at the same time. Plans and specifications are on file in the office of Lorentz Schmidt, architect, Wichita.

Southern States

RALEIGH, N. C.—The Empire Steel Company is contemplating the construction of a hydroelectric plant to develop about 10,000 hp. to supply energy for its proposed steel plant, which will be equipped with electrically operated machinery. Joel F. Armistead, representative, Raleigh, may give further information.

AMERICUS, GA.—Owing to the great increase in cost of operating its plant the Americus Lighting Company has offered to sell its system to local interests at cost. A committee, consisting of Stephen Pace, Lee Allen and others, has been appointed to consider the advisability of accepting the offer. The company recently asked an increase in rates for electricity and gas, which was opposed by the citizens.

ATLANTA, GA.—The proposal to install an electric generating plant at the city crematory has been approved by the City Council and a committee has been appointed to raise the necessary money. The cost of installing the plant is estimated at about \$75,000. Energy generated at the plant will be sold to the Georgia Railway & Power Company.

BRUNSWICK, GA.—The City & Suburban Railway Company is reported to be considering the construction of an extension of its street car line to several industrial plants.

MONTEZUMA, GA.—Plans are being considered by James Harrison and E. M. McKenzie for the installation of a hydroelectric plant on Whitewater Creek, 4 miles from Montezuma. Electricity generated at the plant will be transmitted to Montezuma and Oglethorpe.

POWDER SPRINGS, GA.—The Domestic Electric Company, recently incorporated with a capital stock of \$2,500, is contemplating the construction of an electric-light plant. J. D. Middlebrooks is interested in the company.

TY, TY, GA.—At an election to be held on March 8 the proposal to issue \$7,000 in bonds for the construction of a municipal electric-light plant will be submitted to the voters.

VALDOSTA, GA.—The construction of a hydroelectric power plant on the Withlacoochee River, it is reported, is under consideration by A. F. Langford, general contractor.

FAYETTEVILLE, TENN.—The stockholders of the Fayetteville Electric Light & Power Company have decided to develop a water power on Elk River at a cost of about \$25,000. Machinery, it is understood, will be purchased at once.

HADLEY'S BEND, TENN.—Contract has been awarded by the War Department, Washington, D. C., to the Thompson-Starrett Company, 51 Wall Street, New York, N. Y., for the construction of explosive manufacturing plant, to cost \$60,000,000. The site contains nearly 5000 acres, of which buildings will cover 2000 acres. The warehouses and power houses will be of brick construction, other buildings will be of corrugated iron on wooden frames. The government will build several thousand dwellings for employees.

NASHVILLE, TENN.—Preliminary surveys will be made by the Nashville-Gallatin Interurban Railway Company for the proposed extension from Madison to Neelley's Bend Ferry to serve to government powder plant.

DOTHAN, ALA.—The Columbia Power Company is building a hydroelectric power development at Kelso, consisting of two reinforced concrete power dams, timber storage dam, 26 miles of 44,000-volt transmission lines. All equipment has been purchased. It is estimated that 1500 hp. will be developed at a cost of about \$250,000. Electricity generated at the plant will be transmitted to Dothan, Columbia and Headland. Tucker & Laxton of Charlotte, N. C., are engineers. Dermott Shemwell of Lexington, N. C., is president.

FLORENCE, ALA.—Frank L. Davies of Danville, Ill., it is reported, is interested in a project to construct an electric railway from Huntsville to Florence, a distance of about 64 miles.

LITTLE ROCK, ARK.—Contract has been awarded by the Little Rock Railway & Electric Company for the installation of a turbine to cost about \$200,000.

BRISTOW, OKLA.—The City Council has voted to issue \$36,000 in bonds to take over the local electric-light plant, to be owned and operated by the municipality.

KINGSTON, OKLA.—The Kingston Ice & Light Company is planning to rebuild its plant, recently destroyed by an explosion, causing a loss of about \$25,000.

OKEMAH, OKLA.—The City Council is considering calling an election to vote on the proposal to issue bonds for improvements to the municipal electric-light plant, water-works and sewer system.

STILLWATER, OKLA.—An election will soon be called to vote on the proposal to issue \$175,000 in bonds for improvements to water works, municipal electric-light plant and sewer system.

BOWIE, TEX.—The Texas Light & Power Company is planning to rebuild its electric-light and power plant, recently destroyed by fire, causing a loss of about \$3,000.

CANYON, TEX.—The Canyon Power Company, it is reported, will rebuild its electric plant recently destroyed by fire.

HARLINGEN, TEX.—The municipal electric-light and water plant has been leased to A. Goldammer for a period of five years. Mr. Goldammer, it is understood, will extend the service and build an ice factory.

HOUSTON, TEX.—The City Council is reported to be considering the construction of a municipal belt line in Houston, for which plans have been prepared. E. E. Sands is city engineer.

LA PORTE, TEX.—The La Porte Water, Light & Ice Company is considering the installation of a new generator, ice machine, engine, and making line extensions. Nothing definite as yet has been decided upon. Philip J. Pfeiffer is owner and manager.

Pacific and Mountain States

CHELAN FALLS, WASH.—Contracts have been closed by the Wenatchee (Wash.) Valley Gas & Electric Company for the construction of a 1000-hp. power plant at Chelan Falls. Orders have been placed for machinery and materials and it is hoped to have the plant in operation by July 1, 1918.

COLVILLE, WASH.—A contract has been closed between the Washington Water Power Company of Spokane and the Stevens County Light & Power Company of Colville, whereby an electric transmission line, 40 miles long, will be erected to furnish electricity in the southern part of Stevens County.

EPHRATA, WASH.—The Intermountain Power Company has petitioned the Commissioners of Grant County for a franchise to construct and operate an electric transmission line over certain highways in Grant County.

EVERETT, WASH.—The Norway-Pacific Construction & Drydock Company of Everett, recently organized, has purchased a site in Everett on which it will build a shipbuilding plant to cost about \$1,000,000. Plans have been prepared for a large number of buildings, including ways for five steel ships, two wooden ships, wharves and a 10,000-ton capacity floating sectional dry dock; a pattern shop and foundry, a machine and engine shop, and annealing, forge and boiler works, a power house, and steel fabricating shop, 30 ft. by 240 ft. M. G. Thomle is president.

LA GRANDE, WASH.—Preparations are being made by the American Nitrogen Products Company for the installation of three electric ovens at its plant.

SEATTLE, WASH.—Contract has been awarded by the Board of Public Works to the Pacific Lamp & Supply Company of Seattle for furnishing 500,000 incandescent electric lamps for the municipal lighting department, to cost about \$100,000.

SEATTLE, WASH.—Bids will soon be called for by the Board of Public Works for the construction of the new Ballard substation, to be erected at Fourteenth Avenue N. E. and West Forty-ninth Street, for the municipal lighting department. Plans now being made ready by Daniel Huntington, city architect, call for a two-story and basement reinforced structure, 55 ft. by 55 ft., providing space for two motor-generator sets. Provision will be made for further extensions.

SEATTLE, WASH.—Final action has been taken by the City Council on the passage of an ordinance providing for advertising for bids for a municipal electric-light plant. The ordinance is designed to supplement the previous action in advertising for bids for the construction of a hydro-electric plant on the public domain, so as to enable any one who has a power site to offer it to the city fully developed if he cares to do so. Bids under this ordinance as well as the former will be received until March 1. No bid will be considered if the amount of energy to be developed is less than 10,000 kw. The bids submitted must include a plant fully completed, including necessary dams, wires, diversion works, storage basin, pipe lines, tunnels, conduits, etc. The cost of the proposed system is estimated at about \$5,000,000. C. B. Bagley is secretary of board of public works.

SPOKANE, WASH.—Plans have been completed by City Engineer Butler for the installation of a new ornamental lighting system on Post Street from the new Post Street Bridge to Third Avenue. The cost is estimated at \$37,740.

STEILACOOM, WASH.—The installation of a municipal water-works system is under consideration in connection with lighting plant. A 12½-hp. electrically-operated pump has been purchased for same. R. F. Gleason is electrician.

TACOMA, WASH.—An ordinance is being prepared under the direction of H. F. Gronen, commissioner of the light and water department, which will be submitted to the voters at the election to be held on April 2, asking their opinion on the purchase of a \$5,000,000 power plant for the city of Tacoma.

MARSHFIELD, ORE.—Arrangements are being made by the C. A. Smith Lumber Company to install additional electric equipment to double the output of its mill. Machinery, costing about \$80,000, for the second unit, it is reported, has been ordered.

AZUSA, CAL.—Preparations are being made to increase the output of the substation of the municipal electric-lighting system to 600 kva., at a cost of about \$4,000. Norman E. Humphrey is superintendent.

CHICO, CAL.—The contract for furnishing electricity for maintaining the electrolier lighting system has been awarded to the Northern California Power Company.

PITTSBURG, CAL.—The Pacific Gas & Electric Company has submitted a proposal to the City Trustees for installing an electric service for the southwest addition. The cost is estimated at about \$2,000.

SAN DIEGO, CAL.—The Railroad Commission has granted the San Diego Consolidated Gas & Electric Company permission to distribute and sell electricity under a franchise granted by San Diego County, provided it does not operate in the territory now served by the Del Mar Light & Power Company or the Escondido Mutual Water Company.

MONTICELLO, UTAH.—The capital stock of the Blue Mountain Irrigation Company has been increased from \$15,000 to \$60,000. Amendments have been filed to the charter of the company giving permission to generate and distribute electricity. F. I. Jones is president.

OGDEN, UTAH.—Bids will be received at the office of the chief clerk, Department of Agriculture, Washington, D. C., until March 6 for furnishing office supplies, instruments, field equipment, furniture and telephone and fencing materials to the Forest Service Supply Department Depot at Ogden, Utah, during the fiscal year beginning July 1, 1918. Proposal blanks and further information may be obtained on application to the above office or to the purchasing agent, Forest Service, Ogden, Utah.

PROVO, UTAH.—Application has been filed with George F. McGonagle, State Engineer, by Scott P. Stewart of Provo for permission to take from the north and south branches of North Fork Creek 10 second-feet of water. The plans provide for the construction of a cement dam and a 21-in. iron or wood stave pipe to carry the water to a point where power will be generated by a Pelton water wheel, operated under a 1400-ft. head of water. Electricity generated at the proposed plant will be distributed in Utah and Wasatch Counties.

SWEETGRASS, MONT.—The Toole County Telephone Company, recently organized, is planning to erect about 200 miles of telephone line.

WORLAND, WYO.—The Worland Light & Power Company expects to install a 125-hp. boiler and also to purchase various instruments for switchboard. J. M. Atkinson is manager.

DENVER, COL.—The Queen City Foundry Company of Denver has placed an order for a one-ton Booth-Hall electric steel furnace to replace the converter equipment now in use. The furnace has a holding capacity of three-quarters to one ton, and is rated at 300 kva. Energy will be delivered to the furnace by the Denver Gas & Electric Company.

Canada

BRANDON, MAN.—The installation of an electric generating plant to furnish electricity for municipal purposes, including the street railway system, is under consideration by the City Council.

WOODSTOCK, N. B.—A committee has been appointed by the Woodstock Board of Trade to confer with the federal and provincial governments on the advisability of utilizing the water powers of Grand Falls, Tobique and Meductic in New Brunswick for power and fuel purposes.

CHATHAM, ONT.—The Chatham, Wallaceburg & Lake Erie Railway Company, it is reported, is contemplating utilizing hydroelectric power on the Chatham-Wallaceburg section of its system. Owing to coal shortage the company has not been able to generate sufficient power to keep the line in operation.

TORONTO, ONT.—The plant of the Toronto Laundry Machinery Company, Sorauer Avenue and Dundas Street, was recently destroyed by fire causing a loss of about \$200,000. It had been utilized for the manufacture of shells and will be rebuilt at once.

TORONTO, ONT.—A portion of the plant of the Metropolitan division of the Toronto & York Railway Company, including repair shop, was recently destroyed by fire, causing a loss of about \$100,000. Considerable machinery, it is understood, will have to be replaced.

Miscellaneous

PETERSBURG, ALASKA.—The Council is considering the installation of a turbine at or near the water-works dam with a view of developing power for operating the electric-lighting plant.

(Issued Jan. 22, 1918.)

- 1,254,162. TELEGRAPHIC-RECEIVING INSTRUMENT; Charles Adams Randall, Boston, Mass. App. filed Nov. 28, 1918. Provides a means for augmenting the received signals and rendering them more clear than has been heretofore possible.
- 1,254,171. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed Sept. 9, 1916. Improvements.
- 1,254,172. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed Sept. 9, 1916. Provides a substation consisting of transmitter, receiver, auxiliary resistance and a transformer having a

1,254,938—Cable Terminal Pole

- plurality of windings in combination with a telephone line.
- 1,254,473. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed Sept. 9, 1916. Object is to provide signaling means characterized by the maximum possible ratio of received and transmitted energy and further characterized by the absence of side tone.
- 1,254,476. SIGNALING CIRCUIT; George A. Campbell, Montclair, N. J. App. filed May 18, 1917. Improvements.
- 1,254,477. CIRCUIT-BREAKING DEVICE; Walter W. Carpenter, Lansdowne, Pa. App. filed Oct. 10, 1916. For use in connection with voltage regulators for electric generators.
- 1,254,490. MULTIPLE - FUSE CARTRIDGE; Frederick A. Feldkamp, Newark, N. J. App. filed Nov. 6, 1916. Improved construction.
- 1,254,528. MOLDING ADAPTER; Henry T. Paiste, Philadelphia, Pa. App. filed Dec. 11, 1913. May be detachably connected to a metallic or other molding containing electric conductors.
- 1,254,531. METHOD OR PROCESS OF SMELTING ZINC; Isak Partanen, Telluride, Col. App. filed Feb. 2, 1916. Improvements.
- 1,254,584. IGNITION DEVICE; Arthur Dickerson, Salt Lake City, Utah. App. filed Sept. 17, 1917. For internal-combustion engines.
- 1,254,620. METHOD OF AND MEANS FOR MEASURING VOLTAGES; Max G. Newman, Lanesboro, Mass. App. filed March 1, 1917. For measuring the maximum voltage in a circuit supplied by a variable source of potential, such, for example, as an alternating-current generator.
- 1,254,633. JUNCTION-BOX COUPLING FOR ELECTRIC CONDUITS; John N. Seism, Brooklyn, N. Y. App. filed Dec. 21, 1911. Improvements.
- 1,254,641. FLOOR BOX; Frederick B. Adam, St. Louis, Mo. App. filed April 10, 1916. Comprises a reversible member which forms a flat cover plate for the box when arranged in one position, and when reversed or turned upside down forms a cover provided with a nozzle or raised support for an insulator bushing adapted to receive a cord or electrical conductor leading out of the box.
- (Issued Jan. 29, 1918.)
- 1,254,642. AUTOMATIC CIRCUIT - CHANGING SWITCH; Arthur H. Adams, Sparkill, N. Y. App. filed Aug. 4, 1916. Improvements.
- 1,254,657. TELEPHONE-EXCHANGE SYSTEM; Henry P. Clausen, Mount Vernon, N. Y. App. filed March 13, 1915. Relates to telephone exchange systems of the cen-

Record of Electrical Patents

Notes on United States Patents

tral energy type and has for its object the production of improved signaling means for such systems.

- 1,254,658. IMPULSE-TRANSMITTING DEVICE OR SENDER; Henry P. Clausen, Mount Vernon, N. Y. App. filed Oct. 26, 1916. Relates to senders for controlling selectively operable switching devices employed in automatic and semi-automatic telephone systems.
- 1,254,661. COUNTING APPARATUS; Amos F. Dixon, Newark, N. J. App. filed May 24, 1915. Improvements.
- 1,254,663. METHOD OF TREATING METAL PARTS TO PREVENT SOLDER ADHERING THERETO; Louis W. Downes, Providence, R. I. App. filed July 10, 1917. Improvements.
- 1,254,679. AUTOMATIC TELEPHONE - EXCHANGE SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed July 23, 1915. Improvements.
- 1,254,680. AUTOMATIC TELEPHONE SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed Jan. 3, 1916. Means for eliminating as far as possible the impulse or stepping relays.
- 1,254,681. NON-NUMERICAL SWITCH; Charles L. Goodrum, Brooklyn, N. Y. App. filed Sept. 11, 1916. Type employed in completing connections between calling and trunk lines.
- 1,254,682. TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed Feb. 10, 1917. Relates to machine-switching telephone-exchange systems with subscribers' control and has for its object the provision for partial supervision in systems of this character.
- 1,254,691. TELEPHONE SYSTEM; Edward E. Hinrichsen, New York, N. Y. App. filed April 24, 1917. To reduce the amount of apparatus required in central energy systems.
- 1,254,697. ADJUSTABLE SUPPORT FOR ELECTRIC LAMPS; Johan P. Johansson, Fauna, Enkoping, Sweden. App. filed Jan. 2, 1917. Comprising a flexible electric conductor from which the lamp is suspended and a jointed support for said conductor, the arrangement being such that the support may be swung through any desired angle and the conductor drawn to the desired extent through its support without liability to damage or unduly wear the conductor.
- 1,254,700. ANTI-CATHODE; Edwin W. Kelly, Philadelphia, Pa. App. filed Sept. 30, 1916. For electric vacuum tubes, and particularly anti-cathodes employed in X-ray tubes.
- 1,254,702. EXCAVATING MACHINE; Charles B. King and Frank Rensberger, Marion, Ohio. App. filed June 16, 1917. Applies particularly to a machine for excavating and loading coal.
- 1,254,703. STRAIN RELIEF FOR PENDENT ELECTRICAL DEVICES; Charles J. Klein, Milwaukee, Wis. App. filed June 6, 1914. The grip on the conductor is effected between the socket base and a loose member retained by a part of the casing.
- 1,254,707. METER CUT-OUT AND TESTING DEVICE; Earle A. Le Fever, Buffalo, N. Y. App. filed July 25, 1913. Improvements.
- 1,254,710. SELECTOR - SWITCH MOVEMENT - CONTROLLING CIRCUIT; Alben E. Lundell, New York, N. Y. App. filed Jan. 29, 1916. For use in automatic telephony.
- 1,254,711. TELEPHONE-EXCHANGE SYSTEM; Alben E. Lundell, New York, N. Y. App. filed June 13, 1916. Applies particularly to line testing and guarding arrangements for automatic or semi-automatic telephone exchanges.
- 1,254,712. TELEPHONE-EXCHANGE SYSTEM; Alben E. Lundell, New York, N. Y. App. filed June 17, 1916. In which the establishment of connections is controlled from an operator's position.
- 1,254,713. AUTOMATIC SWITCH; Frank A. Lundquist, New York, N. Y. App. filed Nov. 20, 1916. For interconnecting telephone lines.

- 1,254,736. MAGNETIC CHECK; Frank L. Simmons, Milbury, Mass. App. filed Nov. 5, 1911. Improvements.
- 1,254,758. MECHANICAL RECTIFIER; Arthur W. Winterborne, San Antonio, Tex. App. filed June 24, 1916. Adapted especially for use upon Ford automobiles.
- 1,254,769. ALARM; Clarence A. Braconier, Wayne, Mich. App. filed June 9, 1917. Combined thermal and electric alarm that may be advantageously used as an automatic fire alarm and a heat alarm for brooders and indicators at places where it is desirable that a predetermined temperature shall cause the operation of audible signal.
- 1,254,787. ADVERTISING DEVICE; Alphonse Fernandez, Washington, D. C. App. filed Jan. 10, 1917. Provides means whereby a great number of advertising signs or cards may be displayed in a relatively small space.
- 1,254,812. ELECTRIC - SWITCH CASING; Charles L. Klein, Milwaukee, Wis. App. filed Dec. 8, 1913. Improved means for securing covers to surface switch bases.
- 1,254,814. THERMOSTAT; Edwin B. Lane, West Hoboken, N. J. App. filed Nov. 4, 1916. Proof against vibration.
- 1,254,830. MEANS FOR COMPENSATING FOR DISTURBANCES OF EARTH POTENTIAL; Joseph W. Milnor, New York, N. Y. App. filed March 10, 1917. At the two ends of a system of communication and to avoid any periodic oscillation of potential due to the action of the compensating means itself.
- 1,254,831. METHOD OF AND MEANS FOR CORRECTING FOR ALTERNATING-CURRENT ELECTROMAGNET INDUCTION AND FOR ALTERNATING-CURRENT EARTH POTENTIAL; Joseph W. Milnor, New York, N. Y. App. filed March 10, 1917. Comprises means, including alternating-current generators and automatic regulating devices therefor, for applying to the communication circuit or circuits a correcting potential of proper voltage phase and frequency.
- 1,254,849. BURGLAR ALARM; Willis C. Reed, Cambridge, Ill. App. filed Aug. 10, 1915. Improvements.
- 1,254,851. ENGINE STARTER; Julius H. Richards, Newark, N. J. App. filed Dec. 14, 1914. The feature is the mounting of the gear which engages the engine on a shaft which passes through the armature of the electric motor yet is separate therefrom, thus allowing the armature to remain in a permanent position within its field, by which means it is always in a position to exert its greatest torque.
- 1,254,864. ELECTRIC ALARM; Everett S. Taber, Canton, Mass. App. filed March 30, 1915. Comprising a bell or gong, a hammer and electromechanical means for causing the hammer to strike the bell.
- 1,254,880. ELECTRIC VIBRATOR; William C. Brinton, Jr., Kennett Square, Pa. App. filed Oct. 24, 1916. Improvement.
- 1,254,886. CUT-OUT FOR ELECTRIC CIRCUITS; Nicholas J. Conrad, Chicago, Ill. App. filed June 4, 1917. Inserts a resistance in series with the circuit to be disconnected before actually breaking the circuit.
- 1,254,902. ADJUSTABLE-SPEED MOTOR; Willis W. Hale, Cleveland, Ohio. App. filed Nov. 20, 1915. Operates without serious or detrimental sparking, by rotating brushes engaging a commutator which is connected to the primary or inducing windings.

1,255,080—Fuse

- 1,254,910. MEANS FOR COMPENSATING FOR DISTURBANCES OF EARTH POTENTIAL; Paul J. Howe, Ridgewood, N. J. App. filed March 10, 1917. For compensating for differences of potential between the ground connections at the two ends of a system of electrical communication.
- 1,254,938. CABLE-TERMINAL POLE; Edmund O. Schweitzer, Chicago, Ill. App. filed Sept. 21, 1914. Improvements.
- 1,255,080. FUSE; Wallace L. Cook, Chicago, Ill. App. filed Feb. 9, 1917. Fuse wire is carried in a strip of insulating material, preferably wood.

Planning for Future Coal Supply

MILDER weather and freer freight movement should not blind public utility companies to the continued seriousness of the fuel situation. Experience is a stern teacher and a sure guide. The co-operation of state fuel administrators should therefore be sought at once in planning for the coal supply of the future. Storage in quantities should be resorted to whenever feasible, but it ought to be and is possible so to co-ordinate production and distribution that a constant and regular supply of fuel will be assured to public utilities. If the various state electric associations will make a serious survey of the situation and with the assistance of railroad operators and the state fuel administrators evolve a practical plan of operation, serious shortage next winter will be avoided. The time to take action on such a plan, however, is now.

Brighter Prospect for Western Water Powers

WITHIN the last few weeks there has been notable improvement in the prospect for hydroelectric power development on the Pacific Coast. Drastic action by the fuel administrators—and finally urgent recommendation from these sources for the utilization of hydroelectric power to the maximum—put the water-power question in a new light. Just such a radical turn of affairs has been needed for some time if water-power projects are to be brought back into popular favor, but it remains to be seen whether the improvement in the situation has been great enough to insure that funds for development will be forthcoming. Certain it is, however, that fuel shortage has greatly improved the status of the undeveloped water-power project, and if rate increases comparable with the increased cost of production are allowed by public utility commissions there is a prospect for considerable activity in hydroelectric development. A significant point is that under the new conditions encouragement is given to municipal projects in the same degree as to private ventures, so that several dormant municipal ownership schemes have been brought forward and now give every promise of becoming live issues.

In most of the Pacific Coast centers practically all available power has been absorbed or spoken for, and as new developments have not been numerous of late considerable additions to the total power available are not in prospect, as is usually the case. In the city of Los Angeles it is being urged that funds be made available for the development of additional aqueduct power;

the city of Seattle is going ahead on an ambitious scheme of development on the Skagit River which will doubtless appear in a very favorable light under present conditions, and power companies all along the coast have been taking account of stock and making estimates as to what additional power can be most quickly made available and what it will cost to add it to the system. In the San Francisco district, where the power companies are now combined under one administrative head, each company has submitted to the Railroad Commission a memorandum of additional power possibilities, and these will doubtless be considered collectively with the good of the combined systems in mind. For some time water-power development has been discouraged by the government regulations and restrictions which hedged it about, has been looked upon with disfavor by capitalists, and under adverse rate conditions even developed powers have been unable to offer attractive profits to stockholders. Now conditions are changing. It is to be earnestly hoped that a new order of things will be established judiciously and on a basis such that the much-needed water-power development will be encouraged and aided.

Broader Aspects of Research Work

THE annual report of the president of the Carnegie Foundation, Dr. Robert S. Woodward, contains much of interest to those concerned with the broader aspects of scientific research. The report shows clearly the part which an endowed altruistic organization may play in guiding and promoting investigations of value. Dr. Woodward deprecates the division of research into scientific and industrial and of the sciences into pure and applied. In his opinion both phrases have been turned to account in setting up invidious distinctions inimical to the progress of all concerned. The principal harm probably lies in causing mutual misunderstanding and even alienation between the pure scientist and the applied technologist. The engineer begrudges the physicist and the mathematician their hair-splitting involved writings in which he cannot find a simple relationship needed for the practical problem on hand; while they look askance at and deplore his inaccurate short-cut methods and empirical recipes.

Invidious distinctions of this kind ought not, however, to be longer countenanced. Students should early be taught that the whole store of human knowledge is their property, and that any of it or any of its exponents and specialists may be called upon to assist in the solution of a particular practical problem. With the words "pure" and "applied" dropped, the interests

of both science and industry will materially gain. An optimist who is looking for beneficial results of the great war may point with satisfaction to an active participation of pure scientists in the most important practical problems of the day. Proposed investigations should be characterized as something more definite than "industrial" or "scientific." There should be an infinite number of gradations, rather than two opposite classes.

President Woodward touches a sore spot when in speaking of fallacies he says: "The worst of all these fallacies is found in the not unpopular notion that if experts could be set at work under the direction of inexperts great progress could be achieved. This is the fallacy so often used to justify placing technical work under the administration of politicians and promoters rather than under the charge of competent men." The difficulty, however, lies in the definition of "competent" men under whom research men can thrive and achieve their best. The man who is too much of a researcher himself in some one line may not be competent or sympathetic enough to judge about other lines, and he probably loves his own problem too well to spend much time in supervision and administrative work. On the other hand, a foreman with a stop-watch, an administrator with "vim and vigor," is sure to alienate his scientists and to discourage them. At least some of them will degenerate into "getting results," turning out papers and reports in quantity without much regard to permanent value and quality. And yet, while it is difficult to describe an ideal type of administrator, we have splendid examples like Dr. Whitney of the General Electric Company or Dr. Stratton of the Bureau of Standards. A two-faced Janus, a double personality, is needed, one who is an investigator and an organizer at the same time, saturated with judgment and sympathy and boiled in tact.

Speaking of normal investigators as distinct from pseudo-scientists who apparently bother the Carnegie Foundation sorely, Dr. Woodward strikingly characterizes the latter in one short sentence: "The pseudo-scientist is in general excessively egoistic, secretive, averse to criticism and almost always unaware of the work of his predecessors and contemporaries in the same field." While this may be true of pseudo-scientists, the opposite statement does not always hold true. Not every one who exhibits some of the above-mentioned sins is necessarily an impostor or a low-grade worker. Secretiveness is often imposed by commercial considerations, by modesty, cautiousness, or by the lack of literary ability. A lack of sympathy or interest in advanced investigations on the part of the reading public sometimes accounts for the seeming secretiveness. Again, one sometimes finds a surprising ignorance of the literature of the subject on the part of a high-grade original worker and an extensive knowledge of bibliography among mere compilers, imitators and hack writers. The two probable reasons are a woeful lack of reading knowledge of foreign languages and an absorbing interest in a problem that makes the researcher too stingy of his time to read what others have done. A brilliant research worker often needs a business manager to guide him, to force him to read about other people's work, and to advertise him and his writings. Such a business manager might well underscore in blue pencil some parts of Dr. Woodward's report and lay it on his ward's desk.

Skill Is Needed in Employment Methods

THE demand for skilled employment managers is far greater than the supply. With an apparent labor shortage the wisdom of putting each man in his best place, of giving him the highest type of work he is capable of doing, of encouraging him to improve himself, has been apparent. Intelligent employment methods must become universal. They are necessary for the development of the highest efficiency of the individual as an individual and as a member of an industrial organization. Moreover, they bring employee and employer into close, sympathetic touch. Each will profit from the experience of the other. Such contact, too, is a necessary preparation for the inevitable—co-operative management. Any scheme that is not based on confidence and sympathy will fail.

Uses of the Graphic Meter

A PAPER on the applications of the graphic meter to motor practice by Professor Clewell points a moral, to wit, that it is always wise before undertaking a motor-drive equipment to find out what the real conditions are rather than to rely upon assumptions. In the early days of motor applications the besetting sin of everyday practice was installation of motors considerably too large for the job. This fault was generally an unhappy inheritance from steam-engine practice, in which it was a custom to install an engine as large as would probably be needed and then a couple of sizes larger still for good measure. The result was an uneconomical load all the time, of which the user of the engine was seldom cognizant. Indicators were looked upon as scientific playthings by most manufacturers, and all that anybody knew definitely about the amount of power used was the rating of the engine. When the electric motor came along there was a very strong tendency on the one hand to order, and on the other to sell, a machine of about the same rated output as the previous engine without further investigation. The penalty paid for this indiscretion was high first cost, low efficiency, and in the case of alternating-current motors abominably low power factors. Later people began to make experimental tests of the power actually required, and then reform began. Professor Clewell's paper brings out very forcibly the importance of the graphic meter in finding out exactly not only the output which may be required but also the distribution of that output through the day's work, often economically more important than the actual work required. In these days, when charges for electrical energy are commonly based on demand as well as energy required, the nature of that demand is of large economic importance, and this is precisely what the graphic meter provides ready to hand. It shows not only how much energy is required but hour by hour the probable range of variations. Indeed, it goes further and gives an exceedingly good line on the general activities of the shop, sometimes with results important to the cost of production.

There are two general varieties of graphic meters, each of them important in its own sphere and considerably used. The familiar dial instruments are extremely convenient for rough determinations of demand in terms of time, and from their simplicity they can be

very handily used in keeping records over a considerable period. While not attempting accurately to register the quick variations which sometimes appear, for many uses they are quite sufficient. The curve-drawing instruments working on a continuous roll capable of a variety of speeds and giving results in rectangular coordinates which can readily be graphically integrated meet another class of requirements—those which require a close measurement of power involving quick variations. Cases of this sort arise in connection with some machine tools having a cycle of operations in which the input is necessarily very variable from time to time. Such graphical instruments often give extremely valuable hints for improvements in design and management. Their place is to fill the gaps necessarily left by the simpler and rougher recorders whenever close analysis becomes necessary. Both classes of recorders have their necessary uses, and both should be employed much more frequently than they are, even at the present time when their value has already become well established. Examples given by Professor Clewell as to the kind of information obtainable from these graphical records make their importance clear.

The Columbus Generating Station

THOSE of our readers who are interested in the organization and performance of stations of medium size will read with appreciation the details of the new Columbus (Ohio) plant. Perhaps its most striking feature is its location about 10 miles (16 km.) from the center of the city, where coal and water are readily available. The old-time central station, planted of necessity near the center of load, is gradually passing away; but it is still a little unusual to find a plant for city service deliberately put out where it belongs, and located primarily for good generating conditions, in full realization of the fact that power transmission makes such a location in every way available. Incidentally, the new plant does a considerable transmission business at distances further than Columbus itself. The equipment is a typical one—modern turbo-generators and water-tube boilers—and one of the incidental advantages of an out-of-town location shows in the ground plan layout, all on one floor, which considerably simplifies the care of apparatus.

A sign of the times which should be well heeded is the preparation which has been made for fuel supply. Two 400-ton steel bunkers are being constructed just outside the boiler room, filled by conveyors through a coal crusher and then by tilting with bucket elevators.

An electric traveling larry takes charge of the coal at the bunkers for distribution to the stokers along the firing aisle. These bunkers are merely for temporary supply, and further continuity of action is guaranteed by the storage yard outside, capable of keeping in stock three or four months' supply. This is crossed by an elevated railway from which the coal can be dumped into storage and there distributed or reloaded by a locomotive crane with a grab bucket. The water supply is also well cared for, the source being the river, and it is worth noting that a water-purifying system with two 20,000-gal. tanks is in use to insure the quality of the feed water. The electrical part of the system is along familiar lines, except that the primary voltage is 4150 on a four-wire distribution system, a step upward which could advantageously be taken more often than it is.

Adapting Induction Meters to Different Frequencies

WHEN an alternating-current distributing system changes the frequency impressed by the generators between the limits of 25 and 60 cycles the incandescent lamps and the heaters connected to the system remain unchanged. It is true that the incandescent lamps may give evidence of a flicker at low frequencies, but ordinarily this is not serious. The motors connected to the system, however, require to be changed. The integrating energy meters or watt-hour meters, being motor devices, are also thrown out of calibration by a large change of system frequency, unless they happen to be commutator-motor meters capable of being operated either on continuous or on alternating-current circuits. The ordinary alternating-current induction meter, which is not serviceable on continuous-current circuits, is thrown out of calibration by a marked change of frequency.

The experience of one utility company in regard to the recalibration of its induction meters, when changing its frequency first from 60 cycles to 25 cycles and then, after two years, back again from 25 cycles to 60 cycles, is described in this issue by E. L. Fischer. It is shown that whereas a meter can be adapted to such an increase of frequency by adjustment and recalibration, it can ordinarily only be adapted to such a decrease of frequency by changing the shunt coils as well. In other words, induction meters will suffer a large rise in frequency without change of parts, but not a large fall in frequency. As the meter question is only one of the difficulties that accompany a change in central-station impressed frequency, the manager who undertakes such a change deserves sympathy and condolence.

METHODS of improving economy of operation and construction and of utilizing labor and materials efficiently are uppermost in the minds of utility managers to-day. Two articles dealing with such matters will be published shortly. One will show how to utilize second-hand line material and the other will treat of heat insulation as a solution of the fuel problem. Another very timely article will dwell on the selection, lay-out, application and tests of motor and control apparatus in the plate shop of a recently equipped shipbuilding company. The principles involved will, of course, be equally applicable

The Coming Issues

to many other machine shops. Since the effects of temperature and aging have a bearing on the behavior and performance of all electrical apparatus, the application of a series-inductance bridge for measuring insulation capacity and dielectric energy loss at low frequencies and high-potential gradients, which will also be described in an early issue, will be of interest to electrical engineers. An analysis of the building-heating problem in large cities, made with reference to the distribution of power from central stations, is also to be published soon, and in view of recent experiences should prove of peculiar interest.

Interconnection of Plants in Massachusetts

Spreading Rapidly Through the State, Especially in the Eastern and Central Areas, the Interconnection of Generating Systems Is Recognized as an Economic Movement of Great Importance

This description of progress in the interconnection of generating systems in Massachusetts is another indication of a policy which is receiving increasing attention as a means of conserving fuel and power. The possibilities of interconnection in California and New York were described in the *ELECTRICAL WORLD* of Jan. 5, 1918, page 12.

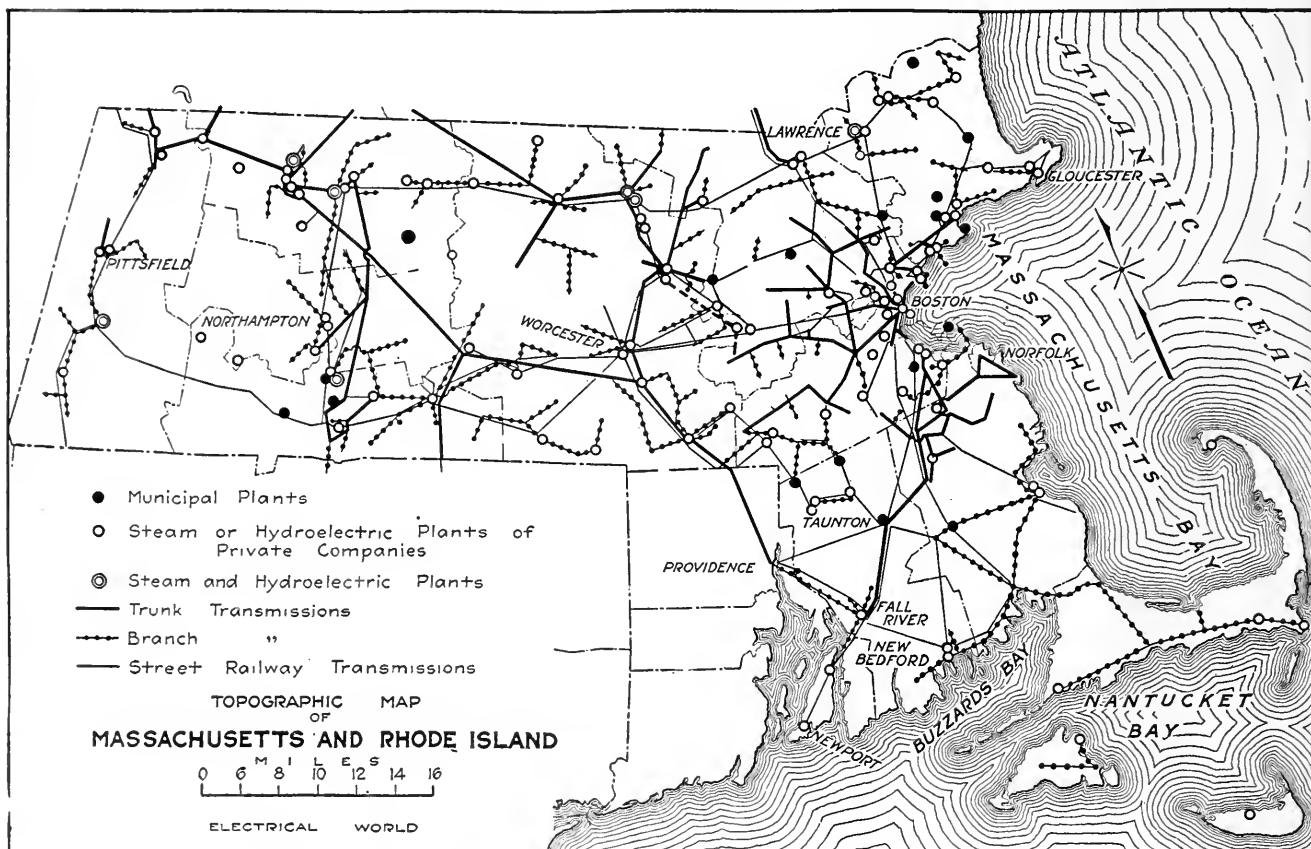

THROUGH the courtesy of the New England Fuel Administration, the accompanying map is presented of all the electric system interconnections in Massachusetts up to date, including hydroelectric transmission lines, central stations, municipal electric plants and street railways.

The map is arranged to show these lines schematically only; it was not designed to exhibit their correct geographical location. Taken by and large, however, it shows that interconnection is now spreading rapidly through Massachusetts, especially in its eastern and central areas. The State is about 200 miles (321.8

miles), the chief of which are the New England Power Company and the Turners Falls Power & Electric Company. Seventeen municipal plants are shown on the map.

The largest central station in the State is that of the Edison Electric Illuminating Company of Boston, and the transmission network radiating from this plant, at L Street, South Boston, serves almost half a hundred municipalities. This system will be connected shortly through the dotted transmission line shown in the east central part of the State with the Metropolitan Water Board's hydroelectric plant at Clinton and thus with the lines of the New England Power Company. This does not mean the entrance of hydroelectric energy into Boston on any considerable scale for the present, but if economic considerations justify it, there appears no serious engineering difficulty.

A recently planned connection is one between the

(Prepared by F. E. Frothingham for the Public Utilities Committee of the New England Fuel Administration)

km.) long on its east and west axis, with an average width of about 60 miles (96.5 km.).

The street railway transmission lines are in general a little less conspicuous on the map than the lines of the interconnected electric supply utilities, and many of the former are operated at 25 cycles. Sixty cycles is the standard frequency of virtually all the Massachusetts central stations and also of the large transmission

Boston Edison system and that of the Tenney syndicate of central stations north of Boston, embracing Malden, Revere and Salem. Running from northwest to southeast is the transmission system of the New England Power Company, forming trunk lines connected with many local central stations, electric railways and also interconnected with the Turners Falls system at Leverett, in the Connecticut Valley. These lines extend

from the Deerfield Valley diagonally across Hampshire and Worcester Counties to the Rhode Island line, where the transmission is extended through the Pawtucket-Woonsocket district to the system of the Narragansett Electric Lighting Company, in Providence, the largest steam relay on the New England Power Company's lines.

From the upper border of Massachusetts a trunk line of this system extends from the Vernon hydroelectric plant through northern and central Worcester County to the operating center at Millbury, outside Worcester, the two trunk line systems being joined here and also looped through Vernon to the Deerfield Valley district. Branch transmission lines extend from the trunks at various points to the Berkshire district in the western part of the State to Camp Devens (the Ayer cantonment), to central stations operated by C. D. Parker & Company of Boston, in central and southeastern Massachusetts, and with connections to the central-station companies at Fitchburg, Worcester, Clinton, Marlboro, Southbridge and other places.

The Turners Falls system is confined chiefly to the Connecticut Valley, in the Springfield-Greenfield district, including both hydroelectric plants and steam relays. Through the interconnection switching station at Leverett a factor of safety of great value has been introduced with respect to wholesale energy supply, as well as an economic opportunity for the best utilization of diversity factors.

Electrical continuity is now a fact from Williamstown (the seat of the college headed by Fuel Administrator Garfield), in the extreme northwestern corner of the State, to Narragansett Bay, Rhode Island, and this will be true soon of the reach from Williamstown to tide-water at Boston.

The map shows that much remains to be done in the way of interconnecting local central stations and municipal plant systems with one another, and that the Gas and Electric Light Commission will find itself provided with no small task if its request to the Legislature goes through for power to order interconnections and the curtailment or shutdown of inefficient stations.

TYPICAL BENEFITS FROM PLANT INTERCONNECTION

**How a 6000-Kw. Station in Massachusetts Gets
Energy at 25 Per Cent Less than It Could
Produce It—Other Advantages**

A transmission line will be completed in the near future between the turbine station of the Narragansett Electric Lighting Company at Providence, R. I., and the plant of the Attleboro Steam & Electric Company at Attleboro, Mass., which will illustrate in a marked degree the advantages of central-station interconnection where one of the plants is relatively small. Before the line could be built it was necessary to obtain the approval of the Massachusetts Gas and Electric Light Commission. In sanctioning the work the commission said in part:

"The present industrial activity and the difficulties in securing coal have emphasized the desirability and even necessity of so co-ordinating the developed sources of power, both steam and hydroelectric, throughout the State by connecting lines as to utilize existing plants

and introduce substantial economies in their operation and future investment. The undertaking in question is a step in this direction, and the board has no hesitation in authorizing the construction of the line."

Despite the war, the business of the Attleboro company in supplying power to jewelry-manufacturing plants and other customers within its territory has increased during the past year. The generating capacity of the Attleboro company's station is 3000 kw., one 1500-kw. and two 750-kw. turbines being in service. The peak load is about 1900 kw., and the load is increasing rapidly for the size of the station. A study of the growth of load indicates that the Attleboro company would be obliged to expend \$630,000 within the next twenty years to meet its increasing business if this were done by progressively enlarging its own station.

The company's total output last year was about 4,000,000 kw.-hr., and the rate of annual increase in business during the past decade has been about 8.5 per cent in station output. The present cost of production is about 1.13 cents per kilowatt-hour.

Negotiations with the Narragansett company, one of the largest central-station organizations in New England, led to an agreement for the purchase of energy from the Providence tidewater station and for the construction of a 35,000-volt transmission line between the systems of the two companies. The capacity of the line is to be 20,000 kw. at 35,000 volts, but for the present it will be operated at 22,000 volts, and not more than 5000 kw. will be required.

The general plan, starting from the Narragansett company's plant, is to furnish energy through underground cables to its East Providence substation, thence carrying the line overhead along the right-of-way of a branch of the New Haven Railroad and northerly across country to the steam plant of the Attleboro company. The total length of line is about 12 miles (19.3 km.) from the East Providence substation to Attleboro, where an outdoor substation is provided in the plan for receiving energy from the line at an estimated investment cost of about \$35,000. The estimated cost per mile, including material and labor but exclusive of right-of-way of the two-circuit, overhead 22,000-volt line is \$6,396.12.

At the outdoor substation in Attleboro about 5000 kw. in transformer capacity is to furnish the initial installation, with switchboard equipment to handle 10,000 kw. It is expected that this installation will not have to be enlarged for over a decade. For all energy supplied the Attleboro company is to pay the Narragansett company at the rate of 8.57 mills per kilowatt-hour, measured on the secondary side of the transformers in the Attleboro plant, with an adjustment for coal price variation and for any energy produced by other means than coal. The base price per kilowatt-hour is to be increased or decreased 0.085 mill for every 10 cents' variation from the base price of \$3.50 a ton for coal. The agreement, which has a life of twenty years from May, 1917, provides for the retention and maintenance of the turbine-driven units of the Attleboro company in the station of the latter, so that energy may be supplied reciprocally to the Narragansett company whenever necessary or desirable. Attleboro is not on tidewater, and by purchasing energy the company saves a 60-cent-per-ton freight rate on coal from Providence.

Columbus Company's Idea of a Modern Station

Plant Established Outside City—Relatively Large Generators—Unit Arrangement in Boiler Room—Almost Exclusive Use of Motor-Driven Auxiliaries—Considerable Electric Equipment Outdoors

UNTIL recently Columbus, Ohio, and many cities like it have been served by generating stations situated very close to or somewhere near the load center of the district served. Owing to the effect which lack of coal storage space and scarcity of a supply of good boiler-feed water will have on the reliability of service and performance of the plant, however, it is usually better to locate the power station outside of the district served and where railroad facilities, plenty of room for coal storage and ample supply of water are available. Because of the developments in transmission equipment which make it unnecessary to locate a generating station at or near the center of distribution, the Columbus Railway, Power & Light Company was able to forget the old requirements influencing the location of generating stations and has recently put in operation its first generating station to be placed

supplies considerable energy for Camp Sherman at Chillicothe and to the cities of Chillicothe and Circleville, 50 miles (80 km.) south of Columbus.

Among the features of the station are the following: The generating units are rather large (18,750 kva.) for the community served. The steaming equipment is arranged in units of two boilers and one economizer each, the economizer having approximately 71 per cent of the heating surface of the two boilers. With the underfeed stokers provided a maximum output of 340 per cent normal rating is effected. The economizer arrangement is such that access is obtained from outside of the building. The brick wall of the building is omitted opposite each economizer, and asbestos sectional covers are used instead. This arrangement economizes floor space and makes the economizers easily accessible for inspection or repair. All steam piping is provided with

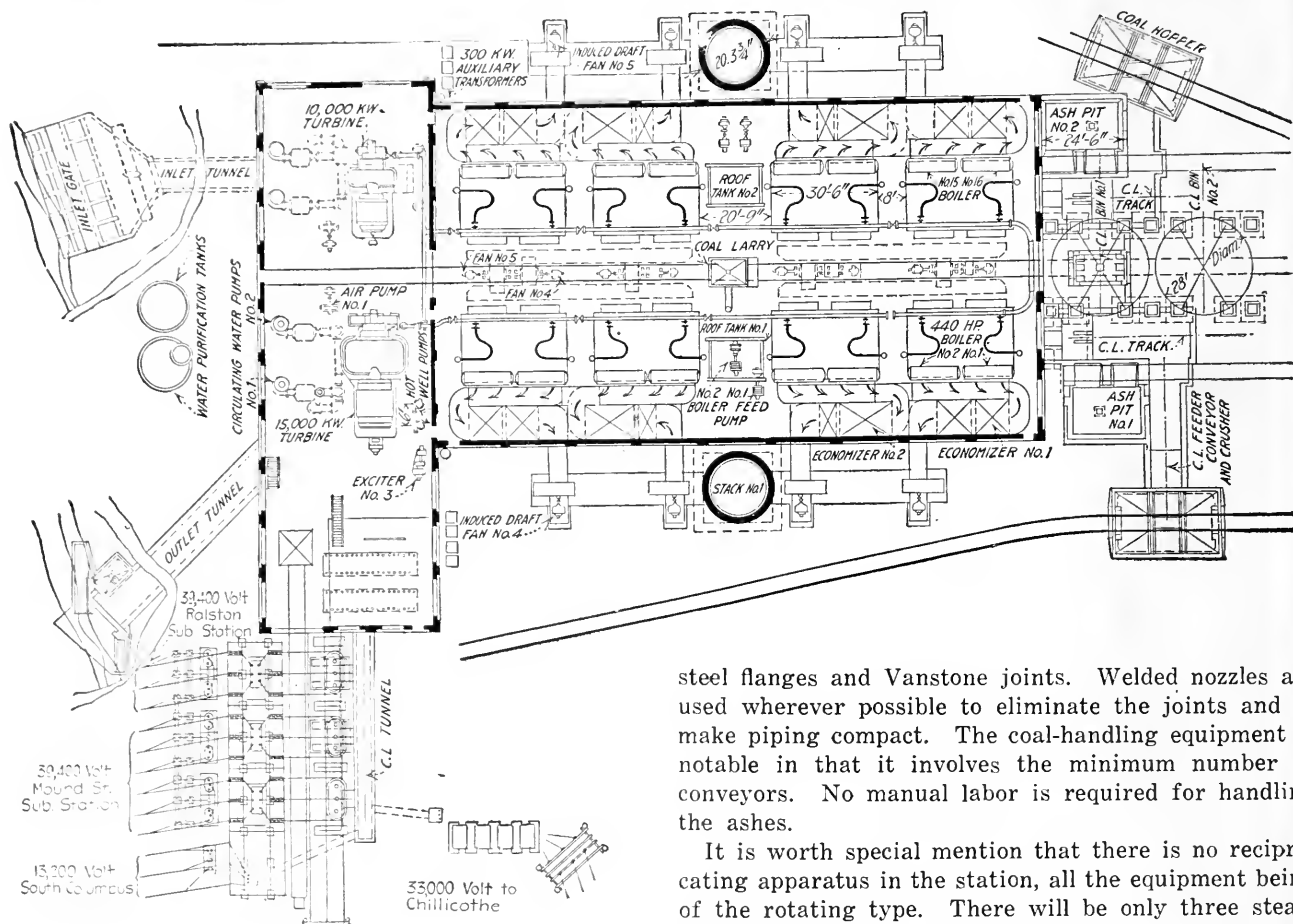

FIG. 1—LAYOUT OF STATION EQUIPMENT AND OUTDOOR ELECTRICAL APPARATUS

outside the city limits, where both coal and water are available. The plant is situated 10 miles (16 km.) southeast of the center of the city. In addition to furnishing energy for the light, power and railway requirements of the city and in a number of towns within a radius of 15 miles (24 km.) of Columbus, the plant also

steel flanges and Vanstone joints. Welded nozzles are used wherever possible to eliminate the joints and to make piping compact. The coal-handling equipment is notable in that it involves the minimum number of conveyors. No manual labor is required for handling the ashes.

It is worth special mention that there is no reciprocating apparatus in the station, all the equipment being of the rotating type. There will be only three steam auxiliaries, including one steam turbine-driven feed pump and two steam-driven dry-vacuum pumps. All other auxiliary equipment is driven by induction motors, the majority of which are of the adjustable-speed type. Every motor and turbine, including the generating units, has flexible couplings.

Very little space is required within the station for electrical equipment, only the generator-voltage switches being installed indoors. All transformers, high-voltage

structures, main-line switches and lightning arresters are situated outdoors, but any of this equipment can be cut out of service and transported into the station for inspection and repair, thus securing all the advantages of the outdoor type of electrical equipment with minimum disadvantages.

Since the station is situated so far from the center distribution, energy will be carried into the city over

FIG. 2—EMERGENCY EXCITATION FOR THIS GENERATOR CAN BE FURNISHED BY TURBO-EXCITER

three transmission-line circuits at 39,400 volts and over one circuit at 13,200 volts (the latter being generator voltage), which will feed an industrial section at the extreme south end of the city relatively near the station. That part of the station which is in operation consists principally of one 18,750-kva. turbine and eight 40-hp. boilers. Two 13,200/39,400-volt, 15,000-kva., three-phase, water-cooled outdoor transformers will be installed for the present, a 12,500-kva. turbine and eight additional boilers will be installed early this year, and a third transformer will be installed at a later date.

In general the plant is laid out with the idea of having all equipment that requires constant attention on the main floor level. This applies to switchboards, turbines, motors for driving circulating-water pumps and hot-well pumps, controllers for all fan and stoker drives, battery-charging sets, etc. Therefore there will be little occasion for the operators to leave the main floor.

COAL AND ASH HANDLING ARRANGEMENT

When the station is completed two 400-ton cylindrical steel coal bunkers will be provided just outside of the boiler room at the end of the station. Coal will be supplied to these bunkers from track hoppers, the coal passing by means of a flight conveyor through a coal crusher, thence by bucket elevators to the top of the coal bunkers. From the bunkers the coal will be carried into the boiler room by means of a $4\frac{1}{2}$ -ton electric traveling larry, which runs along the middle of the firing aisle so that it can be used to supply stokers on both sides when additional boilers are installed. Track scales (Fairbanks-Morse) are provided immediately under one of the coal bunkers so that the fuel can be accurately weighed as it is being carried into the station. The larry has a revolving bin, which works like a turret, and is provided with a screw conveyor which supplies the coal to the stokers. The coal bunkers, crusher and larry are of the Jeffrey type.

While the bunkers will have sufficient capacity to keep the station operating one to two days, irregularities of shipments are guarded against by providing space for

three or four months' supply of coal outside the plant. An elevated track supported on reinforced-concrete piers extends over this storage space so that very little labor will be required in unloading the coal cars, as most of the fuel is received in hopper-bottom cars. The coal will be distributed over the ground and reloaded in the cars for moving into the station by means of a 15-ton Brown steam-driven locomotive crane provided with a 2-yd. (1.5 cu. m.) grab bucket.

STEAMING EQUIPMENT

The boiler plant will consist of sixteen Babcock & Wilcox boilers having 4440 sq. ft. (408 sq. m.) of heating surface apiece. Single-loop superheaters which will give about 150 deg. superheat under average conditions are also provided. Boilers are designed for 250-lb. (17.8-kg.) steam pressure and are provided with Diamond mechanical soot blowers, Copes feed-water regulators, Balanced Draft regulators for opening the outlet dampers and Bailey furnace meters which record the steam flow, air flow to the boilers, the temperature of the exhaust gases and also the draft under the boilers. Each boiler has one eight-retort Sanford-Riley under-feed stoker, with which it is expected to obtain 340 per cent normal rating of the boilers.

The gases from each battery of boilers pass through one Green fuel economizer, being conveyed thereto by means of 5/16-in. (4.93-mm.) steel-plate flues covered with 1.5-in. (38.1-mm.) heat insulation. From the economizers the gases are conveyed to the smokestacks through uncovered steel breechings, the draft being assisted by Green induced-draft fans placed outside the building and driven by adjustable-speed Lincoln motors. Two concrete chimneys will be provided, each chimney accommodating eight boilers or four batteries of boilers. The forced-draft fans for each battery boiler (part Green and part Sturtevant with General Electric

FIG. 3—DUPLICATE VERTICAL-SHAFT MOTORS DRIVING CIRCULATING PUMPS

motors) are installed inside the station below the firing aisle.

It is expected to operate each battery of boilers with its corresponding fans and economizers continuously. When necessary to make extensive repairs the entire unit will shut down, although, of course, either one of the boilers may be shut down for cleaning without dis-

turbing the operation of the other. The controllers for all of the stokers and fans, which are motor-driven, are situated conveniently to the boilers, where they will be under the control of the boiler-room operators. Large steps in the adjustment of drafts will be obtained

FIG. 4—POTENTIAL-TRANSFORMER SIDE OF BUS STRUCTURE

by changing the speed of the fan motors and by the movement of the dampers in the air ducts.

Steam from the boilers will be carried through 6-in. (15-cm.) steam lines to the main 12-in. (30-cm.) steam header. Each row of eight boilers will be provided with a 12-in. (30-cm.) steam header, the two headers being connected together at each end of the station so as to form a complete ring. The feed water will be supplied to the boilers from water heaters arranged in a similar manner.

The economizers, which have no by-passes, are operated in parallel and feed directly into the feed-water header. To avoid unequal feeding from the economizers, Monel metal orifices are provided in the feed-water header between the connections to the economizer. To insure fine adjustment of the feed to the economizers it is the intention to regulate the opening of the valves in the connections between the economizers and the header, determining the adjustment of these valves by the temperature of the feed water leaving the economizers as shown by Bristol recording thermometers. In addition to the Bailey recording furnace meters, there are Bristol recording thermometers for the gases leaving the economizers and for the water entering and leaving the economizers, also for the water entering the feed-water heater.

The foundations for the boilers, which are of concrete, form the ash pits. Two drag-chain conveyors pass under each row of eight boilers, conveying the ashes out to the end of the station and discharging them into a clinker crusher, which in turn discharges into the boot of a bucket elevator. This equipment is also of the Jeffrey type. The elevator may discharge either into a concrete ash pit or railroad car or wagon. For some time it will be possible to dispose of the ashes around the property, as considerable grading can be done. While each drag-chain has sufficient capacity for carrying out the ashes produced, duplicate conveyors

are furnished so as to allow repairs and changes to be made without interrupting operation.

THE WATER SYSTEM

The circulating water for the Alberger surface condenser under each turbine will be supplied by duplicate vertical-shaft, adjustable-speed, motor-driven Wood circulating-water pumps. These pumps receive water from a gravity tunnel which runs under the entire length of the turbine room. After passing through the condensers, the circulating water discharges into another gravity tunnel which also runs the full length of the turbine room and carries the water out into the river at a point about 160 ft. (48.7 m.) below the intake. Each condenser is provided with duplicate motor-driven single-stage centrifugal Alberger condensate pumps. The concrete tunnels under the turbine room eliminate the usual large amount of piping required for circulating water and also supply the water at convenient points with minimum waste of power. The discharge water lines from the condensers are sealed in the discharge tunnels so that advantage is taken of the siphon action.

The intake end of the tunnel is enlarged and provided with large racks. Six large removable wire baskets are also provided to catch leaves, twigs, etc., which may come down-stream during high water. Each basket is in a separate compartment provided with a gate for shutting off the flow of water when the basket is raised for cleaning. A traveling hoist is provided for operating the gates and baskets. Particles that pass through the baskets and racks can be removed before reaching the condenser by means of Elliott twin strainers, which are installed between the circulating-water pumps and the condensers. The circulating-water pumps are installed immediately on top of the intake tunnels, with their shafts vertical, so that a minimum suction lift of about 11 ft. (3.3 m.) is secured.

FIG. 5—HOPPER OUTSIDE STATION WHICH RECEIVES COAL FROM CARS DUMPED BENEATH

The condenser of the 18,750-kva. unit, now installed, is bolted directly to the exhaust flange of the turbine and supported on car springs so as to avoid the use of expansion joints. These springs will allow the condenser to expand when it becomes heated.

The condensate from the condenser is forced by centrifugal pumps, also driven by a vertical-shaft motor on the main floor, to the top of the boiler room, where the water will flow through Alberger-Hammond water meters into an open storage tank. This tank is divided

FIG. 6—ECONOMIZERS ARRANGED TO BE ACCESSIBLE FROM OUTDOORS

into two compartments, one with a capacity of 6000 gal. (22,711 l.) for condensate and the other with a capacity of 3000 gal. (11,356 l.) for make-up water. The water from this storage tank will flow through a Hoppes open feed-water heater having two parts. The condensate passes over one-third of the heating surface and the make-up water over the remaining heating surface. From the heater the water will pass through a battery of four 400-gal. (1514-l.) per minute four-stage Cameron centrifugal boiler-feed pumps. Three of these pumps are motor-driven and one is steam-driven. The pumps will discharge into headers supplying the economizers, the economizers carrying full boiler pressure

FIG. 7—BUS STRUCTURE SUSPENDED FROM CEILING GIRDER TO ECONOMIZE IN CONNECTIONS WITH EQUIPMENT ABOVE

plus the additional pressure required for forcing the water through the economizer to the boilers.

For purifying the make-up water for the boilers a lime and soda-ash plant is installed which consists principally of two 20,000-gal. (75,706-l.) wood-stave tanks with stirring mechanism and an elevated dosing

tank. The river water is of fairly good quality except during high water. A battery of four 200-gal. (757-l.) per minute motor-driven centrifugal pumps is installed in the basement of the turbine room for furnishing water to the feed-water purification plant and for cooling the 15,000-kva. transformers in the yard.

THE ELECTRICAL SYSTEM

The main generators are connected to a 13,200-volt bus through General Electric Type H-3 oil switches. A transfer bus and a transfer switch are provided so that any 13,200-volt switch with its instrument transformers may be cut out of service and worked on when necessary without interrupting service. All feeders and other circuits are provided with the same type of oil switch, and all of them are remote-controlled from the switchboard.

The arrangement of the greater part of the electrical apparatus, which is placed outdoors, is shown on the plan of the station reproduced herewith. The outdoor oil switches for the 39,400-volt circuits are the General Electric KO-36 type, rated at 50,000 volts. They are mounted on pipe framework with the solenoid-operating mechanism and are equipped with three bushing-type transformers and inverse-time-limit overload relays.

FIG. 8—INDUCED-DRAFT FANS OUTSIDE STATION

The bushings are interchangeable with those on the transformers and lightning arresters.

Two-tank aluminum lightning arresters are provided on 39,400-volt circuits and are equipped with sphere gaps, horn gaps and the other usual auxiliaries.

Energy for motor-driven auxiliaries will be supplied by two duplicate banks of three 300-kva., single-phase, 13,200/220 outdoor-type self-cooled Wagner transformers. The total load from motor-driven auxiliaries in the station will amount to 2533 hp.

The main turbo-generator, power transformers, turbo-exciter, the auxiliary motor drives aside from those mentioned, the control-battery charging set and oil drying and testing outfit were other pieces of equipment of General Electric make. The control battery is of the Exide (Electric Storage Battery) type.

In Columbus electrical energy will be received at 39,400 volts at one point for the present. Later the second and third receiving points will be provided. Energy will be distributed in the city between substations at 13,200 volts. The primary voltage for all light and power consumers is 4150 volts on a four-wire distribution system. The tie lines between the principal substations will operate at 13,200 volts and will consist of triple conductor lead-in-cased cables laid in vitrified clay-dust subways.

Selection of Motors Aided by Graphic Meters

These Instruments Also Facilitate Analysis of Machine-Tool Operations—
Advantages and Disadvantages of Different Types—
Value to Industrial Plants

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

The advantages of the graphic meter as an aid to the analysis of machine-tool operations is illustrated by a discussion of difficulties which have tended to retard the placing of motor application work on a scientific basis. Some of the possibilities in this direction through the use of graphic measuring instruments are outlined. Reference is made to various types of graphic meters, methods for making graphic records, and to certain results which may be looked for from their study.

THE selection of the proper size and type of motor for a given machine tool is often made difficult by the lack of information concerning the character of the load and the effective horsepower which corresponds to the successively changing horsepower requirements for the various parts of the duty cycle. An evidence of the many mistakes which have been made in the past in the selection of the motor is the extent of over-motored machines. By using motors which are higher-powered than necessary for driving machinery the initial investment for motors as well as the operating expense is unduly increased.

There are a number of items¹ involved in the application of motors which are of interest especially from the viewpoint of the central station. They include starting current and starting conditions of the motors, the power factor of the load, fluctuations of load, size of units, starting devices, type and voltage of motor and the hours of service. A very interesting case is cited by Wilson where motors used for the operation of refrigerating machines caused serious disturbances on the lighting system. Later the disturbances were found to be intensified on a certain step of the motor controller, so that ultimately special arrangements had to be made in the motor operation. This case is mentioned to show that the study of individual cases of motor-driven machines may be of added importance at times when the same feeder circuit which supplies the motors also supplies other central-station service such as lighting.

For a number of reasons, therefore, the analysis of factory operations becomes an item of considerable importance, and a graphic meter may be used to advantage for analyzing (a) the time required for various machinery operations, (b) the total or effective power required for the operation of given machine tools as well as the maximum peaks at certain points of the duty cycle, and (c) for obtaining such other information as may be desirable from the standpoint of central-station service.² The graphic meter lends itself particularly to the detection of time losses due to delays in chucking the work or to delays caused by neglect of work and to other causes, since by this instrument a

detailed and permanent record is made in terms of time.

SOME AVAILABLE TYPES

The well-known circular-chart type of recording instrument furnishes a convenient basis for graphic records where the changes in the current or power to be measured are not so rapid that they make a blur in the record; in other words, where the changes are such that the recording needle can trace them clearly enough to permit analysis of conditions when desirable.

Owing to the relatively slow passage of the paper under the pen with the circular chart rapid changes in current, like those which made the record in Fig. 1, merely tend to produce a blurred band of ink which indicates little more than the extremes. This indication may often constitute all that is required, however, for such service as the charging of storage batteries. If the changes do not take place too rapidly, as in Fig. 2 for example, the circular chart is entirely suitable.

In the charts just referred to the record is produced by a continuous contact of the pen on the paper, which

FIGS. 1, 2 AND 3—CIRCULAR-CHART RECORDS SHOWING EFFECT OF RAPID CHANGES IN CURRENT, THEIR SUITABILITY FOR INDICATING SLOW CHANGES, AND A CURVE IN WHICH PEN FRICTION IS REDUCED

results in friction that hinders the operation of the recording needle. To eliminate this factor the same general type of instrument has been designed, so that the pen is in contact with the paper only for an instant at a time, producing a dotted rather than a continuous line. A chart of this kind is shown in Fig. 3. In effect, the resulting record is a continuous line except where sudden changes occur. It is fairly obvious that these charts would have limitations in those cases where the performance of the machine tool under investigation placed demands on its motor which were of a rapidly changing character and in the analysis of which

¹Based on a discussion by R. M. Wilson, *Transactions A. I. E. E.*, Vol. 34, p. 774.

²See section on "Measuring Instruments," "Handbook of Machine Shop Electricity," by C. E. Clewell, pp. 278 and 285. An additional reference is made to this source in the explanation of types.

the exact points of these changes and their duration become of the utmost importance.

For this class of analysis the continuous-roll graphic meter is well adapted because the speed of the paper can be made fast enough to record rapid fluctuations. Such a record is shown in Fig. 4.

Graphic meters are classified³ under two heads, (a) those in which the chart or record is made directly by

FIG. 4—CONTINUOUS-ROLL RECORD ADAPTED TO INDICATING RAPID FLUCTUATIONS

the moving element of the instrument, and (b) those where some separate form of mechanism is used for making the record. Class (a) includes graphic meters of such types as those of the Bristol, Esterline and General Electric companies, while the Westinghouse type is an example of class (b).

While graphic ammeters are adapted to direct-current circuits, the graphic wattmeter is to be preferred for measurements on alternating-current circuits. Little or no use is made of the graphic voltmeter for machine-tool analysis. It is desirable for graphic meters to have a fairly high paper speed for this service so that the changes in current or power may be recorded with a fair degree of clearness. In fact, it is considered desirable for graphic meters of this class to have several different paper speeds to take care of more or less rapid variations of the load to be measured. Moreover, a fairly high degree of accuracy of the instrument is recommended, since the record derived from it forms the basis of important conclusions. Finally, the paper on which the record is drawn should have a sufficiently wide scale for showing the extreme variations of the quantities under test.

Class (a) graphic meters (see classification referred to) of the direct-current types for current and voltage readings make use of a stationary-coil solenoid together with a movable element of soft iron in the form of an armature which acts against springs. The alternating-current meters operate on the electro-dynamometer principle; that is, with one coil stationary and one movable. The sensitivity of the instrument in this class is affected to a considerable extent by the friction of the pen on the paper.

Where high sensitivity is important several schemes are employed, one being the use of an intermittent-

contact pen, mentioned before, and another the use of a pointer which traces a record on a smoked chart that is semi-transparent and which is "fixed" in a solution after the record is taken from the instrument, thus making a permanent record.

One type of graphic meter uses a separate relay device for the operation of the pen and its mechanism, which is thus entirely independent of the meter element. In this way the sensitivity of the meter is unaffected by the pen mechanism. The paper for this type is furnished with a scale $5\frac{1}{4}$ in. (13.3 cm.) wide, the co-ordinates being rectangular to facilitate analysis. Rolls 248 ft. (75.6 m.) long may be used, which, at a chart speed of 2 in. (5.1 cm.) per hour, permits two months' steady service.

In this particular meter the paper speed can be set at 2, 4 and 8 in. (5.1, 10.2 and 15.2 cm.) per hour, although speeds up to 4 in. (10.2 cm.) per minute are obtainable. The clock mechanism is self-winding in the standard form, although for low speeds a handwound type may be used. For high-speed paper operation the roll may be operated directly by the small motor which winds the clock.

PRACTICAL RESULTS OF LOAD ANALYSIS

The use of graphic meters of the types just described under actual operating conditions serves to show, (a) the way in which the motor-driven machine tool is being operated, (b) the presence of abnormal conditions in the machinery itself, (c) whether shafting losses are excessive, and (d), by a comparison with other charts from the same machines taken previously they show

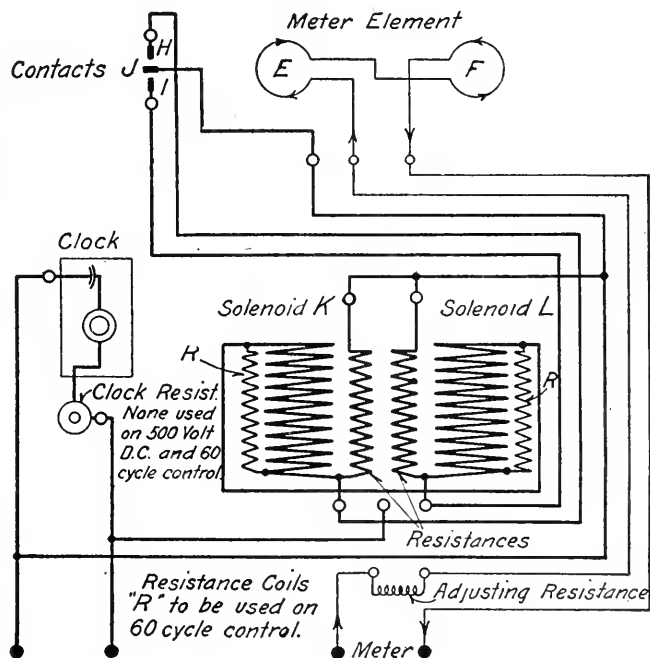

FIG. 5—INTERNAL CONNECTIONS OF ONE TYPE OF DIRECT-CURRENT GRAPHIC METER

whether production is being maintained at a proper rate.

In addition to these indications one of the principal uses in the standardization of machine-tool motor applications is the determination of actual rather than assumed horse-power requirements. This may be accomplished, of course, very readily in the case of machines which are already motor-driven but in the operation

³This classification is based on the "Standard Handbook for Electrical Engineers," fourth edition, p. 171, to which several references are made in this article.

of which there is some doubt as to the correctness of the motor size and type. In the case of line-shaft driven tools for which motor drive is considered a motor may be temporarily connected to the given machine and a graphic record made of its input for establishing the power requirements of the machine tool. In effect, this scheme makes use of the preliminary motor

ing the root-mean-square horsepower of the motor required for the work, as explained in a previous article.

In one case graphic meter records in a shop indicated an idle period for one or two hours each morning for most of the employees. As a result of these records, a study of the situation showed that the inability of the machine-tool operators to get the help of a crane for lifting the material into the machines was the cause of the delay. Additional helpers and better crane service removed the difficulty. Here the important point to note is that a major defect in the shop management was brought to light by the graphic records taken on the electric power circuits.

In another case where steel mill operations were involved the application of a curve drawing instrument, together with the knowledge on the part of the operatives that such an instrument was in use, improved production by nearly 20 per cent. The fact that a record is being made of the work, with a corresponding sense that good work will be noted as well as neglect, seems to stimulate the workmen to improved effort.

OTHER DEVICES

To emphasize the importance of the field of usefulness of the graphic meter for industrial operations, attention is directed to a paper⁵ which discusses the extreme value of the multi-recording instrument⁶ in various branches of electrical work. This instrument differs from the ordinary curve-drawing meter in that the continuous recording paper or tape moves only when a record is made, and a number of different quantities are charted on a single record.

This instrument has been proposed as of value in the recording automatically of the times and extent of the various steps in industrial processes, possibly by the

FIG. 6—POLYPHASE CURVE-DRAWING WATTMETER WITH REROLL ATTACHMENT

as a dynamometer, and the simplicity of this power analysis, in comparison with efforts to make a similar analysis by purely mechanical means, is apparent.

The idea of making fairly complete industrial "electrical surveys" with portable graphic instruments is not new, although its adoption is limited perhaps by a lack of a general appreciation of the advantages of such a course in present-day factories. Such surveys refer to more or less systematic tests of motor-driven machinery for the purpose of making regular checks of the load on given motors in terms of their capacity and for finding abnormal conditions which should receive the attention of the maintenance department.

The convenience and relatively high accuracy of the portable line of graphic meters are certainly important features in the modern types and in themselves commend a wider use of such instruments to the attention of industrial managers. Another advantage of portable meters is their reliability. Chart speeds are easily obtainable for a range from 0.75 in. (1.91 cm.) per hour to 6 in. (15.2 cm.) per minute, with nine values.

Although the actual uses of the graphic meter are very numerous, several applications and practical results will illustrate the field. Thus, in the determination of the power required for elevator operation⁷ a graphic wattmeter may be used to secure a record of watts and time. The resulting curve possesses an area which may be reduced quickly to kilowatt-hours. This value of kilowatt-hours, when taken in conjunction with the distance traversed, gives a basis for finding the kilowatt-hours per car mile.

A graphic meter applied to the motor of a motor-driven lathe gives a chart which may be used for find-

Adapting Induction Meters to New Frequency

How a Company Changed Its Sixty-Cycle Watt-Hour Metering Equipment So as to Operate on Twenty-five-Cycle Energy and Later Changed Back to Sixty-Cycle at Minimum Expense

BY E. L. FISCHER

SOME time ago an electric utility with which the writer was connected found it expedient to change the frequency of its electric-service supply from 60 cycles to 25 cycles. Two years later it became necessary to revert to former conditions. Among other problems, the question arose of what to do with the meters. At first it was thought necessary to dispose of the 60-cycle meters and purchase 25-cycle instruments. By co-operating with the instrument manufacturers and conducting some investigations, however, a scheme was worked out whereby the old meters could be used under the changed conditions without sacrificing meter accuracy or efficiency.

THEORETICAL ANALYSIS OF CONDITIONS

Owing to limited space, it is necessary to assume that the reader is familiar with the operating principles of induction watt-hour meters. To understand the principles on which the changes were made, assume a meter with a shunt coil of zero resistance; that is, one whose impedance is composed entirely of inductive reactance. In such a meter it is at once clear that the current taken by the shunt coil would be 90 deg. behind the impressed voltage, and consequently no "lag" would be required. Now consider that this meter is designed for a frequency f and that it is in a circuit on a system with a frequency n times that for which the meter was designed, or nf .

The torque produced on the disk by the windings of a meter is determined by (1) magnitude of the series and shunt coil flux, (2) phase relation of series and shunt coil flux, (3) frequency of the flux, and (4) resistance of current paths in the rotor or disk. The torque is directly proportional to the first, third and fourth and varies as the sine of the angle between the shunt and series coil flux. The fourth is, of course, unaffected by frequency variation and so will be considered no further.

In placing the meter on a frequency nf the first effect will be, of course, a change in frequency of flux, and from this cause the torque (all other conditions remaining the same) will be n times its former value. The magnitude and phase of the series-coil flux which is caused by the load current would not be affected by a change in frequency. Since reactance varies directly with the frequency, its value under the new condition will be n times the original value; hence the current through the shunt coil will be $1/n$ original value, and so will the shunt-coil flux. The phase relation of the flux to the impressed voltage is unchanged; therefore the torque would be $1/n$ former value, all other things remaining the same. Owing to the difference in frequency, however, it is n times its former value; consequently the resulting torque for a given load and power factor remains unchanged regardless of frequency variation and the meter would be correct on all loads and frequencies.

To an actual meter the above discussion applies so far as flux frequency and series-coil flux magnitude and phase relation are concerned; but, since the shunt coil has resistance as well as reactance, the assumption that the shunt coil is purely reactive with resulting conclusions does not apply. The impedance of the shunt coil varies with the frequency by an amount depending upon the ratio of inductance to resistance. The reactance varies directly with the frequency; the resistance remains unchanged. If this ratio of inductance to resistance be large, the change in impedance will be correspondingly large, and vice versa. It is not possible, unless some specific case be taken up with known or assumed values of resistance and inductance, to determine the exact effect frequency variation has upon the accuracy of induction meters. However, there are certain results which can be foreseen.

It is plain that, since the ratio of resistance to reactance varies, the phase relation between impressed voltage and shunt-coil flux will be greatly affected, and to get anything like successful operation from the meter at the new frequency it will have to be "re-lagged." Also, it is plain that the shunt-coil current will be considerably altered since the impedance is affected. If the frequency be lowered to any great extent, the current will become excessive and heat the coil dangerously, while if the frequency be raised the current is decreased and consequently the shunt coil losses will be decreased.

It is reasonable, therefore, to expect that a meter may be operated successfully on any frequency, within reason, greater than rated frequency by simply recalibrating. It is equally clear that a meter cannot be operated on frequencies much lower than rated because of the excessive current taken by the shunt coil and by the difficulty of getting sufficient lag adjustment. There is every reason to expect then that a meter designed for 25-cycle circuits could be made to operate successfully on 40 cycles or 60 cycles, or even 133 cycles, but a 60-cycle meter could hardly be expected to operate satisfactorily at rated voltage on 25 cycles. The registration of a meter which has a shunt coil in which the ratio of inductance to resistance is very large will be practically unaffected by frequency variations.

RESULTS OF ACTUAL EXPERIENCE

The results of the author's experience in actual work during the changes previously referred to have substantiated the foregoing conclusions to a marked degree. In changing from 60-cycle to 25-cycle circuits we did not find it possible to operate our 60-cycle meters on 25-cycle lines without changes in the meter coils; but in the second change we found, as expected, that we could operate the 25-cycle meters very satisfactorily on 60 cycles by only recalibrating.

Following is a detailed list of just what was done

with each type of meter in the company's service:

General Electric, type I, 25-cycle meter, to operate on rated voltage and loads 60-cycle: Remove the copper bands from the shunt pole, change the heavy-light load adjustment plate for that of a regular 60-cycle meter and recalibrate on 60 cycles, using 25-cycle meter constant. (Note—The speed of a 25-cycle type-I meter is just half that of the 60-cycle meter of same capacity.)

General Electric, type I, 60-cycle meter, to operate on rated voltage and loads 25-cycle: Exchange the 60-cycle shunt and lag coils for regular 25-cycle coils, using the same series coils and laminated sheet-steel structure (if preferred, the entire laminated structure with all coils attached may be exchanged, but this is not necessary); also exchange the register for the register of a regular 25-cycle meter of the correct capacity (this is necessary on account of the change in speeds as noted above) and calibrate on 25-cycle, using standard 25-cycle meter constant.

General Electric, type I-10, 25-cycle on 60-cycle circuit rated voltage and loads: Exchange the heavy copper lag plate and the heavy-light load adjustment plates for the regular 60-cycle plates and recalibrate meter on 60 cycles, using 25-cycle constant.

General Electric, type I-10, 60-cycle on 25-cycle circuit rated voltage and loads: Exchange the entire laminated structure with all coils for the regular 25-cycle structure and coils. Exchange 60-cycle lag and light-load adjustment plates for regular 25-cycle plates. Exchange 60-cycle permanent magnet for 25-cycle magnet; also exchange register as the speed is different. Calibrate on 25 cycles, using constant of regular 25-cycle meter.

General Electric, type I-14, 25-cycle on 60-cycle circuit rated voltage and loads: Remove heavy copper plate attached to laminated structure surrounding shunt pole and calibrate on 60 cycles.

General Electric, type I-14, 60-cycle on 25-cycle circuit rated voltage and loads: Exchange entire laminated structure and coils for regular 25-cycle structure and coils. Also exchange permanent magnet and calibrate for 25 cycles.

Westinghouse, type OA, 25-cycle on 60-cycle rated voltage and loads: Remove the copper bands surrounding the shunt pole and calibrate on 60 cycles.

Westinghouse, type OA, 60-cycle on 25-cycle circuit. This meter cannot be supplied with 25-cycle coils on account of difference in size. It is necessary to supply cases for these, and we found it to our advantage to sell these meters at second-hand values and replace them with regular 25-cycle meters.

Westinghouse, type C, 25-cycle on 60-cycle circuit rated voltage and loads: Remove the copper bands from the shunt pole and calibrate on 60-cycle.

Westinghouse, type C, 60-cycle on 25-cycle circuit rated voltage and loads: Exchange the entire laminated structure with all coils for regular 25-cycle structure and coils; also exchange permanent magnet and calibrate on 25-cycle.

Sangamo, type H, 25-cycle on 60-cycle circuit rated voltage and loads: Break the brass band surrounding the shunt pole and calibrate on 60-cycle, using 25-cycle constant.

Sangamo, type H, 60-cycle on 25-cycle circuit rated voltage and loads: Exchange the shunt and lag coils with their laminated structure for regular 25-cycle coils and structure; also exchange permanent magnet and register gear train attachment and calibrate on 25-cycle, using regular 25-cycle constant. (In the later type H meters it will be found that the laminated structure is of the same dimensions in both 25-cycle and 60-cycle meters, so that the series structure of the 60-cycle meter will fit on the shunt structure of the 25-cycle meter, making it unnecessary to exchange the series-coil structure. In the meters of older type, however, this is not true, and the entire laminated structure would have to be exchanged; also new holes would have to be drilled and tapped in the case, as the supporting lugs of the 25-cycle structure would not fit the holes in the regular 60-cycle case.)

In all of the foregoing changes it should be considered that the word "calibrate" includes the proper lagging of the meter as well as the correct adjustment at full and light loads and unity power factor.

In making the change from 60 cycles to 25 cycles the cost varied somewhat in different types of meters, owing to different costs of coils, etc. The average cost for materials was roughly \$1.75 per meter, and the labor cost, including installation and removal, cartage to and from the shop, and actual labor in the shop, was 60 cents, thus making the total cost per meter \$2.35. This cost is net after deducting for the salvage value of coils, etc.

The second change was not nearly so expensive, practically the entire cost being labor. This item, including installation, etc., as above, was roughly 55 cents per meter.

After making the changes both ways on all meters, it was found that the 60-cycle meters changed to 25-cycle meters are in every case practically identical in operation with meters of the same type designed for 25-cycle service; that the 25-cycle meters operated on 60-cycle are not identical with meters designed for 60-cycle service, as there is in all makes of meters a considerable difference in torque between 25-cycle and 60-cycle meters. It was found, however, that the 25-cycle meters operated on 60-cycle circuits (after the changes listed above) had practically the same torque, maintained accuracy, etc., as they formerly had on 25-cycle circuits, and that the losses were in the neighborhood of 40 per cent of their original value. The company is well satisfied with the results of the change and believes its meters will give entire satisfaction throughout their life.

Electrical Restrictions at Rome

New regulations controlling the use of electricity for lighting and heating have been issued by Rome municipal authorities. Exits of theaters, concert halls, etc., will be allowed only one lamp, not exceeding 60 watts. Present lighting of shop windows and showcases is to be reduced 50 per cent, by discontinuing half of the lamps in use and keeping the candlepower of the remaining half at present value. No further extensions will be permitted, either by changing the candlepower of the lamps or otherwise, in heating and lighting installations of shops, offices, public buildings, etc. Use of energy for heating is forbidden between 4 p. m. and 10 p. m.

Cinders for Fuel in Germany

According to the *Frankfurter Zeitung*, the new power house of the Frankfort State railway station at Frankfort-on-the-Main is utilizing for the first time in the history of German railroading cinders collected by locomotives in special "cinder catchers." When locomotives are cleaned at the end of a trip the cinders are piled on a large heap, from which an electric cable car runs directly to the boiler room. Cinders are fed to grates by automatic underfeed stokers, and the combustion is so complete that less than 0.5 per cent of combustible material is found in the ashes. Three boilers of 250 sq. m. heating surface each supply steam to two turbines of 2000 hp. each, while a third turbine of like rating is to be installed later on foundations already prepared. Energy is generated at 6600 volts, in sufficient quantity to supply light and power demands. This economy is a result of the coal situation.

Initial Current Obtained in Incandescent Lamps

Results of Investigations to Determine the Amount of "Overshooting" of the Current When Metal-Filament Lamps Are Thrown in Circuit— The Three Main Factors

BY C. J. BERRY

Engineering Department National Lamp Works of General Electric Company

The initial current does not rise to a value greater than normal strength in the proportion of the hot to the cold tungsten lamp resistance. Line resistance and reactance drops, and also the behavior of the electrical apparatus supplying the energy, are factors which decrease the effective voltage at the lamp, thereby keeping the current from rising to a high degree. The higher-wattage lamps do not "overshoot" to so high a percentage above normal value as the lower-wattage lamps. The total time required for the current to rise initially and then to settle at approximately a constant value is from 0.1 second to 0.2 second, depending upon the size of the lamp.

There is a marked initial distortion of the current wave form on alternating current that is due to the alternate cooling and heating of the filament. The initial current rises to different percentages, depending upon the point of the voltage wave at which the lamp is thrown in circuit and also upon the condition of the magnetism of the transformer before the switch is closed.

The "overshooting" occurring with vacuum-type lamps is slightly less than that taking place with gas-filled lamps, since the filament temperature of the gas-filled lamp is higher than the operating filament temperature of vacuum lamps.

There is no excuse for fuses blowing or circuit breakers opening when gas-filled lamps are thrown on circuit, provided that the protective apparatus is of proper rating and set correctly, and has a small time-factor element.

WHEN tungsten-filament lamps are first thrown in circuit there is an initial rush or "overshooting" of current caused by the filament resistance of the cold lamp being low as compared to the resistance it has when the lamp is lighted. It is the purpose of this article to show how much this initial current is with different lamps and how long this current exists at the high value. The determination of the initial rise of current or "overshooting," and also the action of the voltage at the lamp at the same time, involves some knowledge of the effect of the line constants. With a rapidly changing current like the initial current of the metal-filament lamps inductance effects have to be taken into account. The main factors influencing the initial phenomena are lamp-filament resistance, line resistance and reactance, and the regulation of the source of supply. These factors will be considered separately in the following paragraphs.

LAMP-FILAMENT RESISTANCE

The resistance of the filament of a tungsten lamp is many times greater when the lamp is lighted than when the lamp is not connected in the circuit; that is, the temperature coefficient of the filament is positive. With the old type of untreated carbon-filament lamps the resistance of the filament decreases as the filament temperature increases.

The lamps used in this work were the gas-filled tungsten lamps, vacuum tungsten lamps and untreated carbon-filament lamps. The lamps were of the 105-125 volt class. All of the differently sized gas-filled lamps between 75-watt and 1000-watt rating were included.

Different sources of energy were used for supplying the energy to the lamps; namely, a 7.5-kw., 120-volt direct-current generator, an 80-amp.-hr., 120-volt storage battery, and a 115-volt, 60-cycle lighting circuit. These different sources of supply were used in order to note any difference in the initial behavior of the current.

Neglecting reactance effects and assuming the voltage across the lamp terminals to remain the same, the current which would flow when the lamp was first put on the circuit would vary inversely as the filament resistance. The initial current theoretically then would be the normal current value times the ratio of the hot resistance to the cold resistance of the filament.

LINE RESISTANCE AND REACTANCE

The initial current under constant voltage conditions at the lamp would be as many times greater than the normal current as the ratio of hot to cold resistance. However, the voltage does not remain constant, because there are self-induction effects occurring on the line and there is an increased resistance drop taking place in the line. Also the regulation of the electrical apparatus furnishing the energy must be considered. Some of the instantaneous effects occurring in the lamp during this initial phenomenon are inductance, skin effect and the cooling of the filament by the gas and leading-in wires, but these effects are probably of very small account. The line from the generator to the lamp was approximately 150 ft. (45.7 m.) long and the wire was No. 8 B. & S. gage copper wire, making the total line resistance approximately 0.2 ohm.

The voltage across the lamp is less than normal line voltage by an amount equal to the sum of the increased resistance drops and reactance drops in the circuit. As the current increases, however, the slope of the current curve becomes less steep, making the successive inductive drops smaller and thereby affording the line voltage a chance to recover. On the other hand, as the current rises the resistance drops in the circuit increase, but this is not large enough to keep the voltage across the lamp from rising to its normal operating potential. The current keeps on rising for only a small interval of time, however, and then it decreases, since the lamp filament is becoming hot very rapidly. As the current increases the lamp-filament resistance increases rapidly until there is finally a point reached beyond which the current does not increase. This maximum point occurs when the lamp resistance begins to increase more rapidly than the voltage across the lamp and is determined by subtracting the resistance and reactance drops in the circuit from the generator emf. This maximum current value is reached in a very short interval of time, varying from 4×10^{-4} to 3×10^{-3} second. The current after reaching its maximum value immediately starts to resume its normal operating value, and this is reached

in about 0.1 second to 0.2 second, as shown by the oscillograms.

VOLTAGE REGULATION AND LINE REACTANCE

The machine used in the tests was a 7.5-kw. direct-current generator. With a machine of this rating it hardly seems probable that the machine regulation would have much effect on any initial voltage regulation. If the generator were small, a poor instantaneous regulation would be expected. Armature reaction and reactance effects as well as armature resistance will produce a voltage change. As soon as the lamp is switched in circuit, the voltage at the generator will drop slightly, since there is this initial "overshoot" of current to the lamp. If a small generator were supplying the energy to the lamps, it could not be expected that the initial rise of current would be so great as if the generator used were sufficiently large to absorb the load without showing a decrease in voltage.

To learn something about the inductive reactance of

FIG. 1—CURRENT, VOLTAGE, POWER AND CANDLEPOWER CHANGE AFTER LAMP IS CONNECTED WITH CIRCUIT

the particular circuit used in these tests, a non-inductive resistance was connected in the line in place of the lamp and the current switched on. In this test an 11-kw. generator was used, because at that time it was impossible to get the 7.5-kw. exciter. An immediate fall in open-circuit voltage on the line, followed by a gradual rise in voltage and current, was noticed on the oscillogram. In this case the voltage and current came to their normal value in phase with each other and reached maximum values at the same time.

The initial drop in voltage can be accounted for by several different actions; namely, generator resistance, reactance and reaction, and line resistance and reactance. It is safe to assume that the circuit resistance remains constant, and hence, neglecting the circuit reactance, the voltage on open circuit should immediately come to its normal value, and the same is true of the current. There is, however, an inductive reactance effect in the circuit which causes the voltage to fall to a low value, from which it gradually resumes its normal value. This inductive reactance effect can be attributed mostly to the line reactance and not to any generator action.

Since the wires for this line were each about 150 ft. (45.7 m.) in length and were run in conduit, the coefficient of self-induction is comparatively small. However, the rate of change of the current with respect to time is great and produces a large back emf. Most lines in practice have a larger coefficient of self-induction and

TABLE I—RATIO OF HOT TO COLD FILAMENT RESISTANCE OF INCANDESCENT LAMPS

Lamp	Ratio of Hot to Cold Resistance (Approximate Only)
Carbon, untreated	0.5 to 1
Metalized filament	1.5 to 1
Tantalum	6.5 to 1
Vacuum-type tungsten filament	11.5 to 1
Gas-filled tungsten filament (75-1000 watts)	14.6 to 1*

*The resistances on which the ratio is based include the resistance of the leading-in wires as well as that of the tungsten filament, but the resistance of the leading-in wires from the lamp base to the filament is only a very small percentage of the total lamp resistance. The increase in the ratio of hot to cold filament resistance of the gas-filled lamps over that for the vacuum lamps is due to the higher operating filament temperature of the gas-filled lamps.

TABLE II—RATIO OF INITIAL MAXIMUM CURRENT TO NORMAL CURRENT

Lamp Wattage	Ratio of Initial Maximum Current to Normal Current	Ratio of Initial Effective to Normal Current
75	12
100	11	1.5
200	10
300	10
400	10
500	9	1.9
750	8
1000	7	2.5

750	0.0021	0.17	0.04
1000	0.0031	0.23	0.07

†If the lamp filament happens to be warm, the current does not rise to such a high maximum value.

TABLE IV—DECREASE IN OPEN-CIRCUIT VOLTAGE INITIALLY WHEN LAMP IS THROWN IN CIRCUIT

Gas-Filled Tungsten Lamp (Watts)	Maximum Current (Amp.)	Line-Resistance Drop with Maximum Current (Calculated), Volts	Decrease in Open Circuit Voltage Initially (from Oscillograms), Volts
75	7.2	1.4	29.9
100	9.0	1.8	35.1
200	17.2	3.4	42.5
300	26.2	5.2	61.4
400	36.6	7.3	61.7
500	45.7	9.1	71.6
750	51.7	10.3	86.0
1000	65.2	13.0	92.6

tend to prevent the current from rising very high initially.

Although the ratio of the hot to cold resistance for gas-filled lamps is 14.6, it may be noted that on none of the oscillograms did the initial current rise to 14.6 times the normal current value. The nearest approach to this was twelve times and occurred with the 75-watt lamps. There is a decrease in the ratio of initial maximum to normal current as the size of the lamps increases. With the low initial resistance of the lamp filament, the current builds up at a very rapid rate, and this produces a reactance drop in the line which,

delivers is approximately 65 amp. it does not seem probable that the generator would show a very marked decrease in terminal voltage, or, in other words, a bad instantaneous regulation.

The initial drop in voltage when a lamp is put on circuit was noticed also when the storage battery supplied the energy instead of the direct-current generator. In fact, the voltage recovery was less rapid in the case of the storage battery. This was evidently due to the change in internal resistance of the battery and perhaps to a time lag of action of the battery.

The current rises to a maximum value in a very short interval of time, approximately from 0.0004 second to 0.003 second, and hence there is a large change in the linkages between the flux and the circuit. This initial back electromotive force of self-induction must be the main cause of the excessive initial voltage drop across the lamp.

Complicated relations take place during this initial phenomenon, and if any mathematical demonstration were applied it would necessitate a knowledge of the constants of the entire circuit and it would also have to take into account the variable voltage at the lamp due to the line reactance, the generator regulation, the variable circuit resistance drop and the change in resistance of the filament with a rapid change in current which would require some knowledge of the thermal capacity or the lag of temperature with instantaneous current. Also with the rapid change in current skin effect in the filament of the lamp would probably have to be taken into account, as well as the heat conduction and convection by the gases in the lamp bulb from the tungsten filament and also the cooling effect of the leading-in wires.

In this article it will be sufficient to state, however, that the current does not "overshoot" in the ratio of the hot to cold resistance. The larger

the lamp, the less will the current "overshoot" when expressed in percentage terms. The current with the 75-watt lamp went to 1200 per cent of normal current, while with the 1000-watt lamp it rose to only 700 per cent of normal current. There is some inherent regulation in all circuits which prevents the current from rising to the theoretical 1460 per cent of the normal current value.

ACTION ON ALTERNATING CURRENT

Some oscillograms were taken on throwing a 1000-watt gas-filled tungsten lamp in circuit, using 60-cycle alternating current. Experiments were performed to determine the effect of switching on the lamp at the zero point and also at the peak of the voltage wave. The oscillograms showed that the time needed for the alternating current to assume a normal value was identical with that required for the direct current to reach its normal value. One might expect, however, that with

FIG. 2—VARIATIONS IN CURRENT WHEN INCANDESCENT LAMPS ARE ENERGIZED
A—112-volt, 120-watt carbon lamp; B—115-volt, 300-watt gas-filled lamp; C—119-volt, 400-watt gas-filled lamp; D—118-volt, 750-watt gas-filled lamp; E—117-volt, 1000-watt gas-filled lamp. The source of supply was a 7.5-kw. direct-current generator, the timing curve having a frequency of 60 cycles

added to the increased initial resistance drop in the line, brings the effective voltage at the lamp to a low value for some of the higher-wattage lamps.

It may be noted that the decrease in voltage read from the oscillograms is very much greater than the calculated line resistance drop due to the maximum current flowing. Since this large drop in voltage across the lamp cannot be all accounted for by a line resistance drop, it must be caused either by a large inductive reactance voltage drop on the line or the regulative action of the electrical apparatus supplying the energy.

The decreases in voltage from open-circuit values expressed in percentage terms range from 27 per cent to 78 per cent of open-circuit voltage. The decrease in voltage in every case as shown on the oscillograms is many times greater than that which could be accounted for by a line-resistance drop alone. Of course, the machine regulation has some effect on this drop in voltage, but since the full load current that this machine

the alternations in current there would be some cooling action on the filament and that more time would be required for the current to assume a normal operating value. The amount of "overshooting" of the current when the 1000-watt gas-filled lamp was thrown in circuit at the peak of the voltage wave was 600 per cent and when thrown in at the zero part of the wave was only 500 per cent. On direct current with this lamp the initial "overshooting" was found to be about 700 per cent.

The current wave form was not a sine curve like the voltage wave form. Some distorting action seems to have taken place. There was an apparent lead of the peak of the current wave with respect to the peak of the voltage wave. The current wave shape was rather steep at first, rising to a peak and then falling off more gradually. This was caused by the change in resistance of the lamp filament. When the current starts from zero up to its maximum value, the filament is at the cooler state and proceeds to the hotter state, producing an "overshooting" effect. When the voltage decreases the current does not assume so great a value as it had at the same voltage point on the increasing side of the voltage wave. In other words, considering two equal voltage values, one on one side of the voltage wave and one on the other side, there is a greater current at the first voltage point than at the second, because the filament is cooler in the first instance than in the second. The current starts to return to zero before the voltage reaches its maximum point, because the rate of change of the resistance is greater than the change of voltage. Assuming constant voltage points on both sides of the voltage wave, on the upward portion of this wave the filament resistance is low, but on the downward portion it is greater, hence less current will flow in the second case. This causes a distortion of the current wave. Since the current reaches its maximum value before the voltage peak, the maximum overshooting occurs when the lamp is thrown in circuit just before the voltage wave reaches its peak value.

The maximum value of the initial current depends somewhat upon the condition of magnetism of the transformer before the switch is closed, and this magnetic condition depends upon the point in the current cycle at which the transformer was opened when last used.

ACTION WITH VACUUM-TYPE TUNGSTEN FILAMENT

Theoretically the "overshooting" of the initial current when vacuum-type tungsten-filament lamps are thrown in circuit would not be so great as that taking place with gas-filled lamps. The ratio of the hot to cold resistance of the vacuum lamps is not so large as that for the gas-filled lamps, and also the cooling effect of the gas in the gas-filled lamps keeps the filament cold longer, giving the current an opportunity to rise. This difference is small and could hardly be distinguished by oscillograms.

Some tests were made using potentiometers for reading the voltage and current to determine with a higher degree of accuracy how long it took for the current to attain a constant value with gas-filled lamps. The results show that the time required for the current to reach a constant value when gas-filled lamps are switched in circuit varies from one-half minute to two minutes for the 100-watt to 1000-watt lamps, inclusive.

There is absolutely no cause for any blowing of fuses or the opening of circuit breakers when a lamp load is first thrown on the circuit, provided that the fuses are of the correct size for the load and the breakers are set properly. The effective current during the brief period of 0.1 second to 0.2 second is only approximately 100 per cent greater than normal. With this overload the ordinary fuse or circuit breakers will not open the circuit because of the time element involved in their operation.

SWITCHING ON LAMP BANK ON SERVICE LINES

In actual practice more than one lamp is, as a rule, thrown on circuit at the same time. The effect is practically the same as switching on one lamp having a wattage rating equal to the sum of the individual wattages of all the lamps put on circuit. If the lamps were not grouped together or concentrated on the line, there would be perhaps a slight difference in the effect produced by switching on a number of lamps or one lamp of the combined wattage, owing to a difference in the current strength at various parts of the multiple line, since there is more current flowing in the line at the supply end. This produces a variation in the reactance and resistance drops in the line, and the initial rush of current at the supply point would be slightly different in the two cases.

Where an installation of vacuum-type tungsten-filament lamps is replaced by one of gas-filled lamps there will be only a very slight difference in the amount of "overshooting" if the total wattage in each case remains the same, although the current in the gas-filled lamp installation will reach a slightly higher value because of the greater difference existing between the cold and hot resistance.

It must be borne in mind that the results of this test are those obtained when using a certain supply source and electric circuit. Slightly different results might be realized under different circuit conditions. The usual circuit would be found to have a greater line reactance, and this means that the initial rise in current would not be as high as the results of this test show.

German Central-Station Rates

A recent communication from the Electricity Administration of Germany discusses grounds upon which central stations are entitled to increase charges, says the London *Electrical Review*. The price of coal has risen 100 per cent or more, that of other working materials several hundred per cent and wages have risen to an extraordinary level. Voluntary allowances to dependents of workmen represent a further heavy burden. Bulk consumers are therefore urged to pay a higher price in proportion to the increased cost, even where long-term contracts give them a legal right to supply at pre-war prices. Other results are being felt from the introduction of "summer time," restricted use of light and power on grounds of economy or because of small works being closed, and absence on active service of innumerable small consumers. It is pointed out that the effective maintenance (financial and material) of electricity and gas works is a matter of national importance, also that these concerns are at present subject to abnormal depreciation as well as increased working costs.

Central-Station December Operations

THE effect of coal shortage and the readjustment of business on account of the war are beginning to show in the returns made by electric utilities to the ELECTRICAL WORLD. Reports of the central stations for December, 1917, indicate an increase of 11.5 per cent in revenue from the sale of energy and of 9.6 per cent in the kilowatt-hour output as compared with December, 1916.

It was to have been expected that the December statistics would carry some reflection of the slow-down in industry which arose from the abnormal operating conditions. Shortage of coal supply was of course a large contributing factor. Another was the gradual but apparently sure reduction in activity of the less essential and non-essential industries. Still another was the aggravated state of affairs in even the industries vital to the prosecution of the war, where railroad embargoes and the general paralysis of transportation facilities, together with labor uncertainties, combined to reduce output of factories.

Though still making an increase in both gross revenue and kilowatt-hour output, the central stations were so affected by the unprecedented situation that their percentage of gain in both items was smaller than in any other month of the year. The gains, however, were good average increases, and it is only as they are

compared with the stimulated output when there were no special handicaps to production that they look somewhat small. An increase of around 10 per cent covering all parts of the country is progress at a very fair rate.

Based on the returns shown for 55 per cent of the industry, the ELECTRICAL WORLD estimate for the whole industry in December is: Revenue, \$44,450,000; output sold, 2,345,000,000 kw.-hr.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

TYPICAL LINE CONSTRUCTION OVER ROUGH TERRITORY

California Company Extends Service Into Mining Regions of North Feather River District Over 60-Mile Route

A 44,000-volt transmission line has recently been completed by the Great Western Power Company over a 60-mile (96.6-km.) route which affords a typical example of the requirements and practice in the rough mountainous sections of northern California. In this length of line there are thirteen crossings of the North

FIGS. 1 AND 2—45,000-VOLT SPECIAL TWO-POLE TOWER, AND POLE TOPS FOR ANGLES OVER 60 DEG.

Fork of Feather River, with spans ranging up to 1500 ft. (457.2 m.) in length. Twenty per cent of the poles had to be hauled up to the line with block and tackle. The line was built to supply mining power load and connects the Big Bend generating station with the Veramont substation near the town of Taylorsville.

In considering what type of construction to use the likelihood of a desire to increase the voltage later to 100,000 had to be considered, as well as the need for mechanical strength of the line required in rugged country and the present high cost of materials and labor. The 3000-kva. load for which each of the two circuits on the line was designed could be carried easily at 45,000 volts, and this voltage was selected. The question of insulators received careful attention, and it was found that by using the pin type (O. B. No. 11,623) the cost per pole would be \$4 per three-phase circuit, including pins, as against \$15 for the suspension type, including hardware. The insulators selected are of the new design, two-part type, tested for 145,000 volts.

For the mechanical strength required it was thought best to use three-strand No. 4 hard-drawn copper wire. Wooden poles were used, 35 ft. to 50 ft. (10.7 m. to 15.2 m.) in length, and for ordinary spans the cross-arms were spaced 5 ft. (1.5 m.) apart. Additional clearance was provided by making the center cross-arm 9 ft. (2.7 m.) in length, while the others were 7 ft. (2.1 m.) long. For spans over 600 ft. (182.8 m.) double-pole construction was used, with 13-ft. (3.96-m.)

cross-arms and a cross-arm spacing of 10 ft. (3 m.).

The Veramont substation at the Taylorsville end of the line is equipped with a bank of three 1150-kva. transformers. These were Y-connected as a compensator bank to keep down transformer investment and to reduce likelihood of arcs and grounds. With this arrangement transformers at generating plant and substation are interchangeable. In accordance with the Railroad Commission's orders for power lines paralleling lines of communication, the transformers were equipped with a low-tension delta winding for 22,000 volts. This winding, in addition to satisfying the requirements for a path for the third harmonic residual components of current and voltage, also afforded a source of supply for local service in the town of Taylorsville. The station is arranged to be as nearly automatic as possible, and a bell alarm system, connecting with the patrolman's house near by, gives warning of automatic switch operation. When the patrolman is out on the line his wife answers trouble signals that come in. So, although no operator is stationed at this point, there is virtually constant attendance. The regulation on the line is expected to be within 15 per cent.

From the Veramont station several short lines have been built to mining properties near by. One of these was a 16-mile (25.7-km.) line, recently built to the Walkers Brothers' copper mine over very rough country in record-breaking time. A bridle trail cut along

MATERIALS FOR ONE POLE TOP

Two poles, 45-ft., class B.
Six cross-arms, 5 in. by 6 in. by 13 ft.
Twelve machine bolts, $\frac{5}{8}$ in. by 22 in.
Twenty-four washers, $\frac{5}{8}$ -in. cut.
Six space blocks (field cut).
Two pieces 1-in. by 6-in. by 12-ft. rough pine.

INSULATORS AND HARDWARE

- (1) Eighteen O.B.-11,535 insulators.
Six O.B.-11,545 socket clevises.
Six open eyes, 2-in.
Six machine bolts, $\frac{5}{8}$ in. by 8 in.
Six washers, $\frac{5}{8}$ -in. cut.
- (2) Forty-eight O.B.-11,535 insulators.
Twelve O.B.-11,545 socket clevises.
Twelve open eyes, 2-in.
Twelve machine bolts, $\frac{5}{8}$ in. by 8 in.
Twelve washers, $\frac{5}{8}$ -in. cut.
- (3) Twelve O.B.-11,623 insulators.
Twelve round-pipe pins, $1\frac{1}{4}$ in. by 14 in.
Twelve machine bolts, $\frac{1}{2}$ in. by 6 in.
Twenty-four washers, $\frac{5}{8}$ -in. cut.

the line was the only means of transportation, and all supplies and materials came in on horseback. Fortunately, it was possible to cut nearly half the poles required near the point where they were erected. The cross-arms were cut from local timber by the sawmill in service at the mine to which the line was being built.

One of the important problems on this line was the question of digging the pole holes, which would be for

the most part in hard rock. The cost of digging these in this remote region with the ordinary crew would have been very high. This difficulty was surmounted in a very satisfactory way by contracting with a crew of miners from a nearby mine, who agreed to blast out holes at the points designated for a flat rate of \$4 per hole. The depth specified was $5\frac{1}{2}$ ft. (1.65 m.). These men, familiar with local conditions, did the job speedily and profitably. They usually worked from daylight to dark. Their earnings over and above explosives varied widely with the conditions and ranged all the way from \$2 to \$12 per man per day.

This line was for 22,000 volts with a capacity of 1000 kva., the conductors being No. 6 hard-drawn copper, and poles were spaced 20 to 24 per mile (12 to 15 per km.). The line was in service, with a 25-ft. (7.6-m.) right-of-way cleared through heavy growth, forty-five days after work was started.

PANELBOARD SIMPLIFIED BY MOUNTING RELAYS ON BACK

Accidental Operation of the Relays Avoided by
Placing Them Above Mopping and Sweep-
ing Zone

By mounting a group of time-element overload relays on the rear of the switchboard as shown herewith, the United Electric Light Company of Springfield, Mass., greatly simplified the front of the panels and brought the relays well above the "high-water mark" of the mopping zone. The only apparatus on the front of each panel consists of the trip and operating handles for one Condit D-12 oil-switch, a General Electric polyphase watt-hour meter and a Westinghouse alternating-current ammeter. The switch rods con-

TERMINALS ARE PROTECTED BY ASBESTOS-BOARD HOUSING

necting the bell-crank levers are carried under the floor, thus making unnecessary the board walk sometimes seen behind switchboards.

The terminals of the relays are protected, being housed in asbestos board boxes screwed into the angle-irons forming the panel framing. The boxes are 10 in. (25.4 cm.) deep, 8 in. (20.3 cm.) high, and either $3\frac{5}{8}$ in. or 5 in. (9.2 cm. or 12.7 cm.) wide, according to whether one or two sets of relay binding posts are housed in each box. The asbestos sides are $\frac{3}{8}$ in. (0.95 cm.) thick, and the top, front and bottom of each box is

of a single sheet-iron plate which springs readily when it is desirable to remove the cover to examine the terminals.

OUTDOOR DISTRIBUTION RACK USED FOR OVERHEAD SERVICE

New England Company Builds Neat Structure of
This Character for Supporting Wires on
Outside of Station

An interesting distribution rack used in connection with a substation of the Edison Electric Illuminating Company of Brockton, Mass., is shown herewith. From the low-tension transformer coils and switching equipment the various circuits are brought out of the substa-

DISTRIBUTION RACK ON EXTERIOR OF STATION

tion in conduit and are extended upward along the outer wall to potheads that are connected with horizontal conductors supported on a pipe and angle-iron frame. From this structure the overhead circuits proceed to the various pole-line structures. The arrangement is neat, flexible and unusually satisfactory from the standpoint of mechanical strength.

INTERESTING RECORD OF POLES SET PER MAN

One Hundred and Twenty Poles Set in Day by
Fifteen Men—Method of Subdividing Labor
to Keep Each Man Busy All the Time

BY J. F. KEYS

The writer was interested in the article on page 1105 of the Dec. 8 issue of the ELECTRICAL WORLD recording the Georgia Railway & Power Company's record of setting sixty-eight poles in one day with twelve men. The construction gang of the Central Kansas Power Company of Gypsum, Kan., recently, with fifteen men, including a foreman, set and tamped 120 30-ft. and 35-ft. (9.1-m. and 10.6-m.) creosoted yellow-pine poles in one day, thus exceeding this excellent record of poles set per man employed by nearly 40 per cent.

The labor was subdivided as follows: Instead of the erecting gang tamping the poles in as is the usual custom, they did nothing but lift the poles into the holes. Two gangs of tampers of four men each followed. The work was so arranged that each man was kept busy all the time and had exactly the same duties

to perform at each pole, so that every man soon became skilled in his work. The foreman went with the erecting gang, helping at the butt of the pole and also lining the poles for the two tamping gangs, which followed closely. Good-natured rivalry between the tamperers and the erecting gang, together with a slight bonus for the completion of the job by the end of the week, also helped speed up the work.

OPERATING A BROKEN CHAIN GRATE IN EMERGENCY

Holes in Grate Temporarily Covered with Barrel Staves to Hold Coal Until It Had Coked Sufficiently to Support Itself

An emergency arose recently in a small Western plant wherein it was necessary to operate two 400-hp. chain-grate stokers which had been taken out of service owing to holes in the grate as large as a man's hand. To permit operation under these conditions wooden barrel staves were placed over the holes as they appeared in front of the hopper. The staves prevented the coal sifting through the grates until they were nearly burned through, at which time the coal had coked enough to support itself. This scheme permitted operating the grates satisfactorily until the repair parts arrived.

PULL SWITCHES USED ON WHITE-WAY ELECTROLIERS

Ceiling-Type Pull Switch Having a Short Operating Chain Which May Be Pulled by Patrolman Is Used

Multiple electroliers for white way lighting are often switched by patrolmen on bicycles or motorcycles. Sometimes each individual post has its own switch and sometimes groups of posts are switched from one point.

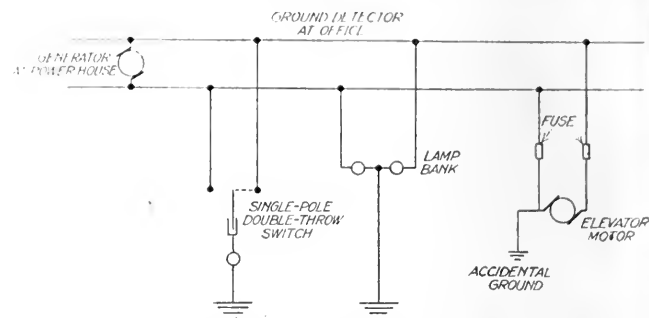

WHITE WAY LAMP EQUIPPED WITH PULL SWITCH

If switches of the knife type are placed in the base of posts, the patrolman must dismount at each switch to operate it. This inconvenience can be avoided by mounting a ceiling type pull switch equipped with a short operating chain having a ring at the end at each switch point. This arrangement is unobtrusive, yet the switch may readily be operated by the patrolman by means of a short hook stick, without the necessity of dismounting.

GROUND DETECTOR FOR ELEVATOR CIRCUITS

Device Installed in Central-Station Office Notifies Company's Employees of Grounds Occurring on Consumers' Premises

A device consisting of a lamp bank and a water rheostat is effectively used by the Memphis (Tenn.) Gas & Electric Company for detecting grounds on consumers' elevator circuits. Pairs of lamps are conveniently placed in various places in the company's of-

WIRING DIAGRAM OF GROUND DETECTOR FOR ELEVATOR CIRCUITS

fice and testing rooms so that a ground can be immediately detected by any one observing their behavior. Two lamps are placed in series across the line with their common point connected to a grounded water pipe. The water rheostat, as shown in the diagram, has one terminal attached to the water pipe and the other arranged so that it may be connected to either side of the line by means of a double-throw, single-pole knife switch.

If a motor circuit becomes grounded, the lamp on the grounded side of the line will be extinguished. The water rheostat is then connected to the opposite side by means of the knife switch and its resistance increased until sufficient current is created to blow the fuse of the offending circuit. If the operator of the motor replaces the fuse, it will immediately be blown again, so that after several trials he will invariably call up the company and report the trouble. A man can then be sent to the premises from which the difficulty is reported, and the exact location of the ground will be discovered in short order.

When the ground is within the motor the lamps will be alternately lighted and extinguished as the elevator goes up and down and reverses the current through the motor. By observing the time interval between reversals the central-station employees can tell approximately what building the ground is in, since in the high buildings the time between reversals is longer than in low buildings.

When this system was first installed it was necessary because of faulty cable to use high-wattage lamps to give a high resistance to ground. Since the cable trouble has been removed the size of these lamps has been reduced to 10 watts. The accuracy of the device is also increased with the decreasing of the resistance to ground.

It has been found that the device always warns the central-station men of grounds and performs a two-fold protective function in eliminating loss of current to ground or possible short circuit from grounds on both sides of the circuit.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

UTILITY AGREES WITH CITY TO THAW FROZEN PIPES

Ohio Company Bills City at \$15 per Service for
Water Pipes Up to 1½ In. Diameter and
Along Established Lines

A contract has just been entered into with the city of Sandusky, Ohio, whereby the Sandusky Gas & Electric Company is paid \$15 per service for thawing out frozen water pipes up to and including 1½ in. (3.81 m.) in diameter. For each ½ in. (1.27 cm.) increase in size of pipe above 1½ in. \$1 additional is charged. This price covers the work along the established lines of the company. Where an extension of more than 200 ft. (60.9 m.) is required \$1 extra is charged for each additional 100 ft. (30.4 m.) of service extension.

In addition, the city furnishes the necessary vehicle to convey the equipment from place to place and an experienced waterworks man to look after the water piping. The city makes all arrangements with the customer and makes collections, and the company bills the city each month for the service rendered. The average time required to thaw out an ordinary service after the current is applied is about eleven minutes.

This does not only mean a substantial profit to the company, but a considerable saving to the city, for were it not for this system being employed, in many instances it would become necessary to take up the pavement in the streets in order to thaw out the frozen pipes by other methods.

The rates in this case are similar in many ways to those used by the Binghamton (N. Y.) Light & Power Company. The latter were described in the ELECTRICAL WORLD for Feb. 16, page 363. Both properties are under the management of the W. S. Barstow Management Association, Inc.

SMALL-COMPANY RATE ADVANCE ANNOUNCEMENT

Interesting Letter That Served to Convince the
Public of the Fairness of a 15 per Cent
Increase in Company's Charges

As a small-company letter which put the need of a 15 per cent rate advance in a few words and served to convince the public of the fairness of the company's position, the following is interesting. The property is situated in Randolph, Mass., a town of fewer than 5000 inhabitants:

The cost of producing and distributing the electricity used by our customers in Randolph and Holbrook has almost doubled during the past year, due to the increased cost of coal, labor, material, etc. We have kept our local expenses at the lowest possible figure consistent with the maintenance of the best service that the company could give to you.

These increased costs, due solely to war conditions, over which we have no control, make it necessary for us to ask

your co-operation by paying for electricity used for lighting, from Feb. 1, 1918, 16 cents per kilowatt-hour, subject to a discount of 1 cent per kilowatt-hour for payment in ten days, making a net rate of 15 cents per kilowatt-hour. This is an increase of but 15 per cent as compared with increases of from 25 per cent to over 100 per cent in the cost of coal, material, supplies and other expenses necessary to supply you with this service. This advance in the price of electricity is necessary to enable this company to continue to pay for energy, labor, taxes, insurance, interest, depreciation, and for the repairs and maintenance required to keep the property of the company in fit condition to serve you.

This increased cost must be regarded as being entirely due to present war conditions, and immediately upon the company receiving any relief from the same a reduction in the price will be made at once in proportion to the relief so secured.

I have the co-operation of E. S. Hamblen, our former superintendent, in solving the problems brought about by these war conditions.

Thanking you for the co-operation you have always given to me and to this company, and trusting you will give me an opportunity to talk with you personally if you feel that this is not a fair rate, I remain yours very truly,

RANDOLPH & HOLBROOK POWER & ELECTRIC COMPANY.

By T. H. DOWD, Superintendent.

A SCHEME FOR ENDING APPLIANCE REPAIR FRAUDS

System of Checks Containing All Repair Data De-
signed to Prevent Customer from Getting
New Devices for Broken Ones

A new repair check system has just been devised by the Harrisburg Light & Power Company of Harrisburg, Pa., for the purpose of putting an end to the petty fraud that creeps into repair department work unless some measure of protection is taken. Not a little trouble has been met in the past owing to the fact that customers would bring in a flatiron or some other heating device to be repaired and on receiving it back would assert that it was not their appliance and that another one had been substituted. Of course, the repair department record would show that an appliance had been received and returned, but it would not prove that it was the identical appliance brought in by this particular customer. The tag, for instance, might have been changed; yet upon investigation of these claims it was found repeatedly that the customer was simply trying in this way to get a new appliance for an old one.

To make this kind of thing impossible the Harrisburg company is now using a simple system of checks numbered in duplicate. The check which is attached to the appliance bears full information as to the number of the appliance, the repair needed, promise of delivery, name of the owner and the charge agreed upon for the work. The stub is given to the owner and must be surrendered and signed in order to secure the appliance. This protects both the customer and the company and does not

put the company in a position where it has to give the customer the benefit of the doubt and present him with a new appliance in order to avoid losing his good will.

COMBINATION GAS AND ELECTRICAL BILLING

Quincy (Ill.) Company Uses Combination Reading Slip, Combination Bill and Combination Ledger—Finds System Highly Satisfactory

A number of combination gas and electric companies have recently found it advisable as a matter of economy to combine gas and electric meter reading and

page—are reproduced herewith. The gas and the electric meter are read at the same time. The company uses the continuous system of meter reading and has a discount day every fifth day. This plan economizes not only the time of the meter reader, who makes but one round to get all readings, but also the time of the customer, who needs to call at the office only once to pay both bills. If the customer pays his bills by check, the combination bill saves him postage and effort. The plan of having a discount day every fifth day is considered a good compromise between the old idea of a discount day once a month and that used by larger companies of having every day a discount day. The combination ledger, which is the loose-leaf type, is a

FORMS USED IN THE HANDLING OF GAS AND ELECTRIC ACCOUNTS IN COMBINATION: (A) COMBINATION LEDGER PAGE FOR LOOSE-LEAF SYSTEM; (B) THE COMBINATION BILL; (C) THE COMBINATION READING SLIP

billing. This is not a new practice, but one that has been growing for some time and has lately received a noticeable increase.

For three years the Quincy (Ill.) Gas, Electric & Heating Company has been using combination meter-reading and billing forms. Three of the printed forms—a reading slip, a combination bill and a ledger

time saver for the office force when used in connection with the combination reading slip.

In speaking of the combination plan of billing, and reading meters, H. O. Channon, manager of the company, said: "The system effects a saving in labor and material and gives good satisfaction to the customer, so it seems that there is little excuse for using any other."

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Notes on the Design of Electromagnetic Machines.—STANLEY PARKER SMITH.—In Part I of the article the author dealt with some of the main principles underlying the design of alternating-current generators. In Part II these principles were applied to the design of a low-speed, three-phase alternator, giving 750 kw. at 2200 volts when running at a speed of 250 r.p.m. In this, the third, part a three phase turbo-alternator is designed to give 2000 kw. at 3000 r.p.m. at a line voltage of 500, and the mechanical stresses in the rotor are discussed.—*London Electrician*, Feb. 1, 1918.

Lamps and Lighting

Economics in the Operation of Large Lighting Installations.—CLARENCE L. LAW and JAMES E. BUCKLEY.—This paper describes the details and routine necessary to the economic operation of lighting installations served by central stations, with particular reference to the systems of the illuminating engineering department of the New York Edison Company. Surveys and subsequent recommendations based thereon cover the preliminary steps and layout of a new installation or in the improvement of an old one. The paper includes sample illumination tests, tabulations and curve sheets showing location of lamps, horizontal intensities, average foot-candles, current consumption and weather charts.—*Transactions of the Illuminating Engineering Society*, Feb. 11, 1918.

Generation, Transmission and Distribution

Electrical Propagation Upon an Open-Circuited Line.—E. BRYLINSKI.—A very elaborate mathematical discussion of this subject by means of methods derived directly from the methods previously employed by Lord Kelvin and Vaschy in the case of a short circuit. It seems evident that the closing of a circuit breaker in an open-circuited line in good condition is not in itself dangerous. Were there condensers, coils or other apparatus in the circuit, it might be otherwise; but this would present a more complicated case demanding new studies.—*Revue Générale de l'Electricité*, Jan. 12, 1918 (reprinted from the *Bulletin de la Société Internationale des Electriciens*).

Water Powers of New England.—HENRY I. HARRIMAN.—After giving an outline of the amount of water power developed in the New England States, the additional amount which can be developed, the amount of coal which would be saved thereby, and the total fall in the principal rivers of New England, the author discusses the relative economy of steam and water-power generating stations. The latter involves a consideration of the ability of each to carry peaks and loads of high load factor, the requirements of the water power for auxiliary electricity during periods of low river flow, and the ability of the steam station to supply this need without added capital expense. Basing his

statements on some reliable figures, the author says that the fixed charges on a steam plant might be almost half of those on the corresponding hydroelectric plant, whereas the operating expense for the hydroelectric plant may be one-eighth to one-twentieth that of a steam plant, this range being due to the difference in sizes of steam plants, their load factors and efficiencies. Whether the statement that one-half of the capacity of central stations is idle 95 per cent of the time be correct or not, it is certainly true that every station must have a very large carrying capacity during the greater portion of the year; but, fortunately for both steam and hydroelectric plants, the period of low water occurs during the summer and early fall, when the central station load is at its minimum. All of these facts lead to the conclusion that the large steam plant and hydroelectric station can be developed economically, depending on the service for which it is best suited and each giving to the other the economy which neither could have alone. In closing, the author says that the water powers of New England are to-day producing more than 2,000,000,000 kw.-hr. of energy. If this energy were produced by coal, it would mean an annual consumption of 3,000,000 tons.—*Journal of the Boston Society of Civil Engineers*, December, 1917.

Forces Which Act Upon a Transmission Line.—CHARLES R. HARTE.—Data are given by means of which the factor of safety of a pole line can be calculated.—*Electric Railway Journal*, Feb. 23, 1918.

Traction

Saving Fuel Through Operating Economies.—A committee of engineers shows how more than 25,000 tons of coal can be saved yearly on Washington electric railways. The report by Messrs. Renshaw, Lamber and Layng estimates that an annual saving in coal of 25,790 tons could be made by the Washington electric railways, as follows:

Source of Saving	Tons per Year
Skip-stop plan	9,400
Double berthing and modifying rapid-transit stops.....	600
Eliminating unnecessary mileage in non-rush hours.....	3,220
Reducing heat 50 per cent.....	2,250
Shutting down small plants to effect the same load reduction as would carrying all Capital Traction Company's load by Potomac Power Company.....	9,700
Staggering office hours of government departments.....	620
Total	25,790

If heat is shut off during peaks instead of being reduced 50 per cent all day, the saving would be 1500 tons instead of 2250 tons and the above total would be correspondingly reduced.—*Electric Railway Journal*, Feb. 9, 1918.

The Coire-Arosa Railway.—An account, taken from the official publication of Brown, Boveri & Company, of the Coire-Arosa electric railway in Switzerland. Energy at 2000 volts direct current is supplied by a trolley line actuated from a power house at Coire, each

car containing four series motors.—*Revue Générale de l'Electricité*, Jan. 12, 1918.

Installations, Systems and Appliances

The Electric Furnace for Melting Ferromanganese.—At a meeting of chemists in Sweden J. Harden stated that the electric furnace was particularly suitable not only for the production of ferromanganese but also for melting it. The ease of control of temperature afforded by the electric furnace and the avoidance of loss of material which it insures render this the best means of melting the alloy. Any type of furnace will serve, but the induction type is the most economical. The cost of operation is about 20 shillings per ton of ferromanganese. In addition to the even temperature maintained, there is a considerable economy of time and material, important items, especially with ferromanganese at its present price of £75 per ton.—*London Electrical Review*, Feb. 1, 1918.

Motor Versus Engine Drive for Pumping Plants.—This article summarizes an investigation of practices and tests of pumping equipment that show advantages of electric drive. Observations from practice, comparisons of electricity and other forms of power for pumping, electric pumping costs, selection of the motor and the economics of operation are taken up.—*Railway Electrical Engineer*, February, 1918.

Wires, Wiring and Conduits

Combined Table of Sizes in the Principal Wire Gages.—This table combines in one series the sizes in the American (B. & S.) steel, Birmingham (Stubs'), British standard and metric wire gages, arranged in order of diameters of wires. It gives the diameters of all the gage numbers in these five systems, in mils, inches and millimeters, also the cross-sections in square mils, circular mils, square inches and square millimeters. The table is specially useful to manufacturers who wish to determine the nearest equivalent in American or British gage sizes of wires specified in millimeters or square millimeters, or vice versa.—*Bureau of Standard Circular* 67.

Electrophysics and Magnetism

A General Method for Studying Periodic Currents.—JOHN MILLS.—The method illustrated may be summarized as follows: (1) The concept of the vector operator i ; (2) the concept of a rotating vector and its expression in an equation; (3) the rate of change of a rotating vector; (4) the concept of a conjugate vector; (5) the representation of a simple harmonic motion, e. g., an alternating current, by the sum of two conjugate vectors; (6) the representation of a damped alternating current by the sum of two conjugate vectors which are similarly reduced exponentially. With the tools thus obtained the transients of spark-set wireless transmitters, the oscillations of tuned and coupled circuits, the currents in unbalanced three-phase circuits, the impedances of transmission lines and other similar magnitudes may be dealt with quantitatively by purely algebraic methods. As a by-product of this method a method is suggested for approaching trigonometry which might be used with some types of students to shorten the time now required for its study.—*Bulletin of the Society of Engineering Education*, January, 1918.

Electrical and Thermal Properties of Iron Oxide.—D. C. BIDWELL.—Data on the electrical resistance and thermo-electric power of specimens of iron oxide, with information on thermal conductivity of Fe_2O_3 . The work is an extension of previous research, having been carried to the melting point of the oxides studied (1520 deg. C.). The electrical resistance in the case of Fe_2O_3 is found to obey the exponential law suggested by Königsberger. When plotted to the corresponding logarithmic equation the two transformations revealed by thermo-electric power lines are strikingly corroborated. Owing to the change in composition of Fe_2O_3 , which occurs on heating, the pure temperature variation is masked, but a wide difference from the behavior at Fe_2O_3 is shown. The change of thermal conductivity of Fe_2O_3 with temperature is found to be a linear one up to 1050 deg. C., the limit of the investigation, although a transformation takes place at 720 deg.—*Physical Review*, December, 1917.

Small Electromagnet for Medical Men.—In order to facilitate the work of the surgeon who wishes to pick out small particles of iron from the human body, Prof. G. Sultan has devised a small handy electromagnet. The magnet is held by a fork which is pivoted on a small stand and can thus be swung around and inclined at will; the magnet can further be shifted in its fork by means of a hand wheel, so that the conical pole piece can be adjusted to any particular spot. The instrument is illustrated in the *Elektrotechnische Zeitschrift* of Oct. 8, 1917.—*London Engineering*, Jan. 25, 1918.

Electrochemistry and Batteries

Storage Batteries on the Italian Railways.—FRANCESCO ROSSI.—An account of the use of storage battery cars on the state railways of Italy and of their costs in comparison with steam traction. The author figures a difference in their favor as regards operating charges of 24.6 per cent and predicts a wide and varied use for the "automotrici" and storage-battery locomotives in Italian industry after the war.—*L'Elettrotecnica*, Jan. 5, 1918.

Telegraphy, Telephony and Signals

Telephony Over Telegraph Lines.—REGNONI.—A description of the Castelli and other apparatus for establishing telephonic communication over a single-wire telegraph line with return through the earth. The problem is, of course, hardest where there is induction to be overcome. V. E. Castelli, chief inspector of the Italian state railroads, has perfected two sets of apparatus—one for short and one for long distances.—*Revue Générale de l'Electricité*, Jan. 12, 1918 (abstracted from the *Rivista Tecnica delle Ferrovie Italiane*, July, 1917).

Loading Coils Versus Repeaters.—W. N. FURTHMANN.—In previous articles on loading coils and repeaters the discussion has shown that the difference of impedance of two telephone circuits or sections it is proposed to join causes reflection losses in telephone transmission. Losses of this kind are present in sections composed either of loaded or non-loaded conductors. The author points out that in loading a telephone circuit it is necessary to consider these losses, as they vitally affect the amount of current that will be received at the end of the line. Since loading coils are fundamentally required to insure a sufficient amount of current at the receiving end of the line, it follows clearly that terminal transformers should be employed in the

common cause. Terminal transformers of high efficiency are certain to contain some transmission loss. The problem involved in their use, therefore, requires careful analysis. They cannot consistently be used where their inherent loss is greater than the good they are to accomplish. The author brings out data in the form of patents which show on their face that terminal losses were not considered in the original invention of a repeater.—*Telephone Engineer*, February, 1918.

Telephone Exchange Transfers and Their Organization.—F. G. C. BALDWIN.—The author points out that transfers may be effected in three ways, as follows: (a) By transferring each line independently; (b) by transferring the subscribers in groups, and (c) by transferring the whole of the lines at one operation. The author points out that method (a) possesses certain commendable features, but traffic considerations unfortunately preclude the adoption of this method. Method (b) has similar, although less, serious objections. Method (c) is the one usually adopted. From a traffic point of view difficulties are reduced to a minimum; the actual operation can be carried out expeditiously—the time being measured in seconds—and a period can be selected for the change when it is known that the traffic will be at a minimum and when least possible interruption to the service will ensue. The author discusses in detail line plant considerations, methods of effecting transfer, preparatory line work, preparatory work at subscribers' stations, preparatory work at old exchange, at new exchange, final preparations, the transfer operation, and traffic and operating considerations.—*London Electrician*, Feb. 1, 1918.

Miscellaneous

Gravitational Repulsion.—FRANCIS E. NIPHER.—In this paper the author describes experiments which, he says, indicate that gravitational attraction between masses of matter depends upon their electrical condition. Not only has gravitational attraction been diminished by electrification of the attracting bodies, says the author, when direct electrical action has been wholly cut off by metal shields, but it has also been made negative or converted into repulsion. This result has been obtained many times. On one occasion the repulsion was made somewhat more than twice the normal attraction. The peculiar feature of the experiments was, however, that passing direct current through the bodies being studied had no apparent effect, the force of gravitation being offset only by using alternating current.—*Transactions of the Academy of Science of St. Louis*, Vol. XXIII, No. 5.

Distillation of Coal.—E. PIERNET.—A plea for distilling all coal that can be so treated for fuel purposes and an account of efforts along this line made in England, Switzerland and Germany. The author says also that by the use of special apparatus tar and pitch may be utilized directly as fuel.—*Revue Générale de l'Electricité*, Jan. 12, 1918.

Masonry in the Central Station.—L. CONGE.—An inquiry into the building and care of furnace walls. The author takes up the quality of the material, considering both ordinary and refractory brick and also the mortar best suited to the work; the care that should be exercised in construction, and the reactions from the temperature or from the composition of the cinders. The effects of calcareous water on masonry are also

mentioned.—*Revue Générale de l'Electricité*, Jan. 12, 1918.

A Substitute for Copper.—German industrial circles are very much interested in the discovery of a new alloy which, it is said, will replace copper for technical purposes. The new metal is said to have a greater density than copper and lower elongation, while being an excellent conductor of electricity. A certain number of tests have already been made on the alloy, and a representative of the A. E. G. is in negotiation with the inventor with a view to acquiring the patent rights. The A. E. G. will probably grant a license to a large foundry at Lausanne to manufacture the substitute. "Lack of detailed information," says the editorial comment, "forbids us to comment with any approach to conviction on the matter, but we may point out that hitherto experience has indicated that any alloy of two metals may be expected to possess a higher resistivity than one of its constituents. Hence, while it would be reckless to deny the possibility of producing an alloy with high conductivity, we are very skeptical as to the reliability of the inventor's claim in this respect."—*London Electrical Review*, Jan. 25, 1918.

Turbo-Rotor Cap Rings.—R. ROBERTS.—The author investigates the calculation of stress in turbo-rotor cap rings and by means of examples shows how these stresses may be calculated for some commonly used designs. In conclusion, the points that may be considered when designing these cap rings are summarized.—*London Electrician*, Jan. 18, 1918.

Electric Ship Propulsion.—A novel method of operating certain classes of overseas traffic is proposed by H. de M. Snell, which consists essentially in using one set of engines for a number of hulls. With the system proposed by Mr. Snell a set of Diesel engines driving electric generators is fitted in a steel caisson, which also contains the engineer's quarters. This caisson is mounted detachably on the stern of any one of perhaps five hulls. These hulls are to be fitted with electric motors driving the screw but with no other propelling machinery. On arrival at port the whole caisson is to be lifted by pontoons from the hull of the incoming vessel and transferred to one about to depart. This operation can, it is claimed, be effected very rapidly by the use of special pontoons. As the machinery caisson is to be mounted on the stern of the hulls, the whole of the propelling machinery is confined to the after end of the boat. It is claimed that with this arrangement more effective subdivision of the vessel is possible, giving greater security against torpedo attack.—*London Engineering*, Jan. 25, 1918.

Luminosity of Rectifier Electrode.—HARVEY B. LEMON.—In setting up as a demonstration experiment the well-known arrangement for rectifying an alternating current, the essential part of which is an aluminum rod and lead plate in 10 per cent sodium-phosphate solution, the following observation was made: When the aluminum rod is positive—that is to say, when the current is in such direction that it will not pass through the rectifier—a very distinct luminosity appears over the surface of the aluminum, and if the applied potential is as high as 250 volts, this luminosity becomes quite brilliant enough to be observed by a spectroscope. The observer asks for explanations of this phenomenon.—*Science*, Feb. 15, 1918.

NEW OFFICERS OF THE ENGINEERING COUNCIL

**J. Parke Channing Elected Chairman and Committees
Appointed—Definition of the Council, Representing Now 33,000 Members**

At the first annual meeting of the Engineering Council, on Feb. 21, J. Parke Channing was elected chairman, Harold W. Buck first vice-chairman, George F. Swain second vice-chairman and Alfred D. Flinn secretary. The following committees were appointed:

Executive committee: The chairman, the two vice-chairmen, and David S. Jacobus, Calvert Townley, George J. Foran.

Finance committee: E. Wilbur Rice, Jr., chairman; Charles F. Loweth, Sidney J. Jennings, David S. Jacobus.

Rules committee: J. Parke Channing, chairman; Clemens Herschel, Nathaniel A. Carle, Irving E. Moulthrop.

Public affairs committee: Charles Whiting Baker, chair-

R. Richards, Charles L. Edgar, Carl Scholz, David Moffat Myers, Edwin Ludlow, Harold W. Buck.

The definition of the Engineering Council that was adopted declared that "The Engineering Council is an organization of national technical societies of America created to provide for consideration of matters of common concern to engineers, as well as those of public welfare in which the profession is interested, in order that united action may be made possible."

The Engineering Council is now composed of the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers, having a membership of 33,000 and known as "founder societies." The new chairman, J. Parke Channing, is vice-president of the Miami Copper Company and the General Development Company.

J. PARKE CHANNING

man; George F. Swain, Benjamin B. Thayer, E. W. Rice, Jr., Charles E. Skinner.

American engineering service: George J. Foran, chairman; George C. Stone, Alfred D. Flinn, Dr. Addams S. McAllister, Edward B. Sturgis, secretary.

War committee of technical societies: D. W. Bruntno, chairman; Arthur H. Storrs, secretary; James M. Boyle, Nelson P. Lewis (American Society of Civil Engineers), Edmund B. Kirby (American Institute of Mining Engineers), A. A. Greene, Jr., R. N. Inglis (American Society of Mechanical Engineers), Harold W. Buck, Dr. Addams S. McAllister (American Institute of Electrical Engineers), Dana D. Barnum, E. C. Uhlig (American Gas Institute), Joseph Bijur, Dr. Charles A. Doremus (American Electrochemical Society), Louis B. Marks, Preston S. Millar (Illuminating Engineering Society), Christopher R. Corning, George C. Stone (Mining and Metallurgical Society of America), Henry Torrance, F. E. Matthews (American Society of Refrigerating Engineers).

Fuel conservation committee: L. P. Breckenridge, chairman; Ozni P. Hood, secretary; Robert H. Fernald, Charles

Presenting the Case for the Utilities

Committee Representing Utility Associations Brings to the Attention of Washington Authorities the Critical Situation Created by the War

A COMMITTEE appointed to represent four national associations of utilities in bringing to the attention of the authorities at Washington the critical situation in the public utility industry as brought about by war conditions has submitted a report. The committee consists of P. H. Gadsden, E. K. Hall and H. H. Crowell. Its report is made to the National Electric Light Association, American Electric Railway Association, American Gas Institute and National Commercial Gas Association.

It is the opinion of the committee that if the credit of the public utilities is to be preserved care must be taken of four phases of the situation:

1. Rates must be increased sufficiently to absorb the increased costs of producing the service.
2. The utilities must be relieved during the period of the war of all non-essential and unproductive requirements, such as paving, undergrounding of wires, duplication and unnecessary extension of service.
3. Some way must be found to enable the utilities to take care of obligations maturing while the war lasts.
4. Assistance must be provided to enable the companies

to finance the unavoidable extensions of service made necessary by the nation's war program.

This analysis of the situation was presented by the committee to John Skelton Williams, Comptroller of the Currency. In his report to Congress, Comptroller Williams called attention to the conditions confronting the utilities, as stated in the ELECTRICAL WORLD of Feb. 9, 1918, page 318.

As a result of this analysis of the situation by the Comptroller, supplemented by additional information and representations to the Treasury Department by the committee, Secretary of the Treasury McAdoo presented the matter to the attention of President Wilson. The letter of Secretary McAdoo and the reply of the President are published below. The report of the committee continues:

The capital issues committee, which will be made a part of the organization of the War Finance Corporation, and before which your committee had a hearing lasting practically an entire day, has already stated that the policy of the national government will be to discourage the sale of

Maintain Utilities at Maximum Efficiency, Says the President

SECRETARY McADOO TO PRESIDENT WILSON

February 15, 1918.

DEAR MR. PRESIDENT:

I beg to hand you herewith several memoranda and letters relating to street railway and other local public utilities furnishing light, heat and power, which I have been asked to bring to your attention by a committee representing public utility interests.

These papers indicate the existence of genuine apprehension regarding the adequacy, under present conditions, of the services and rates of local public utilities. The view is expressed that increased wages and the high cost of essential materials and supplies have affected them as they have affected everybody else, and that united effort will be necessary in order to meet alike the public requirements for service and the corporate financial needs upon which that service depends.

As Secretary of the Treasury I must take official notice of these matters. It is obvious that every part of our industrial and economic life should be maintained at its maximum strength in order that each may contribute in the fullest measure to the vigorous prosecution of the war. Our local public utilities must not be permitted to become weakened. The transportation of workers to and from our vital industries and the health and comfort of our citizens in their homes are dependent upon them, and the necessary power to drive many of our war industries and many other industries essential to the war is produced by them. It may be that here and there, because of the prominence given to less important interests immediately at hand, state and local authorities do not always appreciate the close connection between the soundness and efficiency of these local utilities and the national strength and vigor and do not resort with sufficient promptness to the call for remedial measures. In such cases I am confident that all such state and local authorities will respond promptly to the national needs when the matter is fairly and properly brought before them.

Our public service utilities are closely connected with and are an essential part of our preparations for and successful prosecution of the war, and the unfavorable tendencies which the accompanying papers reveal may most effectively be checked, wherever they may be found to exist, and the needed relief obtained, only by prompt action on the part of the respective local authorities.

I earnestly hope that you may feel justified in expressing the conviction that the vital part which the public utilities companies represent in the life and war-making energy of the nation ought to receive fair and just recognition by state and local authorities. Cordially yours,

W. G. McADOO.

The President, the White House.

THE PRESIDENT'S REPLY

THE WHITE HOUSE, WASHINGTON,

February 19, 1918.

MY DEAR MR. SECRETARY:

I have examined with care the memoranda and letters which you transmitted to me with your letter of the fifteenth. I fully share the views you express regarding the importance of the public service utilities as a part of our national equipment, especially in war time. It is essential that these utilities should be maintained at their maximum efficiency and that everything reasonably possible should be done with that end in view. I hope that state and local authorities, where they have not already done so, will, when the facts are properly laid before them, respond promptly to the necessities of the situation.

I shall be glad to have you communicate with the local authorities whenever the information in your possession suggests that such a course is desirable and in the national interests. Cordially yours,

WOODROW WILSON.

Hon. William G. McAdoo, Secretary of the Treasury.

securities, either public utility, municipal, state or otherwise, for non-essentials. It will be the policy of the government to mobilize all money, labor and materials for the successful prosecution of the war and eliminate for the period of the war non-essential expenditures. When this policy is finally put into effect through the enactment of the war finance bill, it should mean that the companies will be relieved of non-essential expenditures, such as unnecessary paving, undergrounding of wires, etc.

As to the matter of financing maturing obligations and extensions and improvements necessitated by the war program, provision is made for this in the war finance bill, Senate No. 3714, reported on Feb. 21 by the Senate committee on finance. The latter committee gave your committee a hearing and has inserted in the bill a clause designed to cover the needs of public utilities as follows:

"(D) To make advances directly (1) to any corporation owning or controlling (directly or through stock ownership) any railroad or other public utility, and (2) to any firm, corporation or association conducting an established and going business whose operations are necessary or contributory to the prosecution of the war; provided that such advances shall be made only in such cases as the board of directors in its discretion shall determine to be of exceptional importance in the public interest. Such advances may be made for periods not exceeding five years from the passage of this act, upon such terms and upon such security and subject to such rules and regulations as may be prescribed from time to time by the board of directors of the corporation, with the approval of the Secretary of the Treasury. The corporation shall have and retain power to acquire additional security from time to time."

The outlook for the public utilities, decidedly more encouraging than it was two months ago, may be summarized as follows:

1. In the matter of rates the President of the United States, the Secretary of the Treasury and the Comptroller of the Currency have officially recognized that it is in the public interest that public utilities be maintained at their maximum efficiency and their rates be adjusted to meet the increased costs of doing business.

2. The national government, through the capital issues committee, has outlined a national policy seeking to discourage unnecessary employment of money, labor and materials during the period of the war.

3. The war finance bill, now on its passage, makes provision for financing the maturing obligations of public utilities and provides a method for financing necessary extensions and enlargements.

The utility associations are issuing a bulletin containing the letters of the President, the Secretary of the Treasury and the Comptroller of the Currency. In conclusion the committee says in its report:

We recommend that the national associations also take steps to present this general matter to the commissions in the different states as a national question, entirely dissociated from any concrete local question of rate increases for any particular company. Until the general situation has been taken up in this way with the various state commissions, we suggest that you urge your members not to formally submit to the commissions the President's and the other letters, except in instances where they are immediately necessary in pending cases.

We recommend that you arrange to furnish your members with as many copies of the bulletin containing these letters as they may require, and that they be distributed generally among the officers and employees of the various companies.

You will notice that the last sentence in the President's letter to the Secretary reads as follows: "I shall be glad to have you communicate with the local authorities whenever the information in your possession suggests that such a course is desirable and in the national interests."

Your committee calls attention to the fact that the authorities in Washington are already overburdened with tremendous and overwhelming responsibilities, and suggests that under the circumstances members should appeal to Washington only in cases of imperative necessity, and then only after first consulting with their own secretaries.

WASHINGTON TELEPHONE CASE BRINGS UP PUBLIC OWNERSHIP

Postmaster General Burleson Offers to Take Over Control and Operation of the Chesapeake & Potomac Telephone Company During War

Postmaster General Burleson, through Washington city post office officials, has offered to the Public Utilities Commission of the District of Columbia to take over the control and operation of the Chesapeake & Potomac Telephone Company in and around Washington for the period of the war, agreeing, if the offer is accepted, to maintain present standards of pay to telephone employees and guarantee to investors the present rate of return on their holdings.

It is believed in Washington that under present District of Columbia laws creating the Public Utilities Commission and outlining its powers and duties the commission has no power to accept such an offer, although it is well understood that the President of the United States, under the blanket war powers granted him by Congress, could issue an executive order making it possible for the commission to accept such an offer if he deemed it wise to do so. Without such an order it is believed that it is not possible for the commission to accept such an offer except by consent of the telephone company. Officials of the company in Washington decline to discuss the offer.

NECESSARY STEPS TO PUT OUT SECURITIES

Capital Issues Committee of Federal Reserve Board Shows What Should Be Done to Get Its Formal Sanction

As stated in the last issue of the *ELECTRICAL WORLD*, approval has already been given by the capital issues committee of the Federal Reserve Board to the issue of securities by some electric utilities. The capital issues committee has now made public instructions with respect to proposed issues of bonds, notes, shares of stock, etc., in part as follows:

Applications should be addressed to the capital issues committee, 718 Metropolitan Bank Building, Washington.

If the purpose is to refund, fund or pay or extend outstanding bonds, obligations or indebtedness, describe fully the nature and character of bonds, etc., to be refunded and state briefly the time or times and the general purposes for which unsecured indebtedness was incurred.

If the issue is to be made for war purposes or to raise capital in connection with war contracts or war supplies, or to provide equipment, buildings or facilities of any kind for war work, full description thereof and amounts needed therefor should be stated.

If any war purposes are involved, reference should be made to the proper governmental authorities at Washington and elsewhere to enable definite information and corroboration to be obtained directly by the committee.

If the issue is deemed necessary on account of any governmental requirement, national, state or municipal, or of any commission or public authority, describe the same in full.

If the issue is deemed necessary for reasons of public health or welfare or other public economic necessity, describe the same in full.

If the issue is made for private financial requirements and no public interests are involved, a very clear exposition of necessity will be desired.

In all cases full reasons should be given why the proposed issues cannot be postponed until after the war.

MUSCLE SHOALS DAM

TO BE CONSTRUCTED

President Authorizes Huge Hydroelectric Project on Tennessee River as Part of New Government Nitrate Plant

President Wilson signed an order on Feb. 25 authorizing the construction of the largest of the dams on the Tennessee River projected some years ago as the Muscle Shoals hydroelectric development.

The construction is to be carried out with funds derived from the appropriation for a government nitrate plant which was made by Congress in 1916, and the hydroelectric plant when completed will become a part of the two nitrate plants now being built near Muscle Shoals at Sheffield, Ala.

These two plants are (1) a factory for the fixation of nitrogen which will produce approximately 20,000 tons of ammonium nitrate a year and will be owned and operated by the United States and (2) a plant owned by the United States but operated by the Air Nitrates Corporation, which will produce 110,000 tons of ammonium nitrate a year.

Electricity used in the operation of these plants will be generated by steam power and will be brought from distant hydroelectric plants for initial operation, but will eventually be produced at Muscle Shoals.

FIXTURE ASSOCIATION HOLDS SECOND ANNUAL CONVENTION

St. Louis Meeting Discusses Advisability of Joining Contractor-Dealers' Association—C. J. Netting, Detroit, Elected President

The feature of the second annual convention of the Lighting Fixture Dealers' Society of America, at the Statler Hotel, St. Louis, on Feb. 15 and 16, was a discussion on the advisability of affiliation by that organization with the National Association of Electrical Contractors and Dealers.

The discussion brought out that the opinion of the fixture association is divided on this point, one faction feeling that the organization should join with the contractor-dealers, and the other that the fixture business is not really an electrical business, but is more of an art dealers' business. The outcome of the discussion was a decision to appoint a committee to consider whether or not the fixture association should affiliate with the contractor-dealers. This committee is to report not later than the June meeting of the National Association of Electrical Contractors and Dealers. Frank Adam of St. Louis had been authorized by the National Association of Contractors and Dealers to issue an invitation to the lighting fixture society to affiliate with the contractor-dealers.

George H. Barnes, Detroit, presented before the association an able paper containing a considerable amount of tabulated data on the cost of handling glass used in the lighting-fixture business. The association gave the executive committee authority to hire an organizer and secretary. J. Callahan, Detroit, was selected.

The following officers were elected: President, C. J. Netting, C. J. Netting Company, Detroit; vice-president, A. L. Oppenheimer, Enterprise Electric Fixture Company, Cleveland; secretary, J. A. Hamilton, Ham-

ilton-Stotter Company, Cleveland; treasurer, H. E. Pauley, Wallbridge & Co., Buffalo; executive committee: W. L. Burgess, Burgess & Ganden Company, Omaha; E. L. Gress, Gress Chandelier Company, St. Louis; Albert Jacobson, Kansas City (Mo.) Chandelier Company; George H. Barnes, George H. Barnes Company, Detroit.

ASSOCIATED MANUFACTURERS WORK ON INTERNATIONAL TRADE

At New York Meeting Further Progress Is Made in the Consideration of Tariff Matters Affecting the Electrical Manufacturers

A meeting of the international trade committee of the Associated Manufacturers of Electrical Supplies was held at the offices of the association, New York, on Feb. 14. John J. Gibson, the chairman, presided.

Mr. Gibson stated that since the last meeting of the committee the board of governors had taken action to broaden the duties of the committee so that they would include questions in regard to export as well as import and that the name had been changed from tariff committee to international trade committee.

The chairman reported the results of a visit which he had made to the United States Tariff Commission offices in Washington. Commissioner W. S. Culbertson outlined to the chairman the plans of the commission.

Commissioner Culbertson suggested that in the near future a conference might be held between the commission and representative electrical manufacturers.

Mr. Gibson said that he had discussed with Commissioner Culbertson the advisability of employment by the association of a tariff expert. Commissioner Culbertson expressed the belief that such a plan would provide the surest and quickest way of accomplishing the object sought.

Attention was called to section 704 of the act of 1917 creating the Tariff Commission, which reads:

That the commission shall have power to investigate the tariff relations between the United States and foreign countries, commercial treaties, preferential provisions, economic alliances, the effect of export bounties and preferential transportation rates, the volume of importations compared with domestic production and consumption, and conditions, causes and effects relating to competition of foreign industries with those of the United States, including dumping and cost of production.

This section practically covers the newly added duties of this international trade committee. It practically indicates that the work of the committee is parallel, so far as the electrical industry is concerned, with the work of the United States Tariff Commission.

L. Livingston brought up the question of the customs administrative laws and read a digest which he personally had made with respect to certain divisions of the present law and to the suggested revision thereof. A similar digest, made by William C. Burgess, Trenton, N. J. (which was forwarded to the chairman by B. E. Salisbury, of Pass & Seymour, Inc.), was read.

Copies of the digests of the customs administrative laws, prepared by Messrs. Livingston and Burgess, will be sent to members of the board of governors and of the international trade committee and to chairmen and members of the section sub-committees on international trade.

COMMONWEALTH EDISON RESULTS FOR THE YEAR

Operating Revenue for 1917 Reaches \$25,350,000—
Operations Conducted Without Increase in
Rates, Notwithstanding Higher Costs

Operating revenue of the Commonwealth Edison Company for the year ended Dec. 31, 1917, was \$25,351,585, an increase of \$2,488,467, or 10.9 per cent, over the previous fiscal year.

Net operating revenue for 1917 amounted to \$8,723,702, as compared with \$8,133,073 in 1916. The net for the stock was \$4,677,077, or 10.21 per cent on the company's capital stock, as compared with \$4,399,413, or 9.6 per cent on the stock, for the previous year. Earnings and expenses for the year were:

Operating revenue	\$25,351,585.35	
Operating expenses	\$13,791,636.29	
Appropriated for amortization and depreciation reserve	2,836,246.41	16,627,882.70
Net operating revenue	\$8,723,702.65	
Taxes and municipal compensation.....	2,229,906.74	
Operating income	\$6,493,795.91	
Other income	314,831.27	
Total income	\$6,808,627.18	
Less interest on bonds.....	2,131,550.00	
Available for dividends.....	\$4,677,077.18	
Dividends paid	3,667,352.00	
Balance carried to surplus.....	\$1,009,725.18	

President Samuel Insull speaks in the report of the successful operation without increased rates in spite of higher costs. He also discusses the advantage of ownership of coal mines by the company, whose general coal policy enabled it to provide fuel for domestic consumption at critical periods. Mr. Insull's comments follow in part:

There has been charged against taxes and correspondingly credited to taxes accrued an amount deemed sufficient to cover 1917 municipal, state and federal taxes with the exception of war excess profits taxes. This amount will take care of the increase in the income tax, the rate of which has been increased from 2 per cent to 6 per cent on the earnings of the company before payment of dividends.

While the Treasury Department officials have furnished some information and rulings regarding the war excess profits taxes, they have not yet issued the necessary forms on which the taxes are to be calculated and reported to the Treasury Department, and still further rulings are to be expected.

As therefore more or less doubt now exists as to the exact requirements to be followed in making up the report of excess profits, the company considers it inadvisable to attempt any estimate in the matter, but prefers to wait until it is in position to file the official figures and then whatever amount may be found to be payable will be charged against the company's surplus.

In view of the great increases which have taken place during the past year in the cost of labor and materials as a result of the war, without any increase in rates charged, the board feels that the company may justifiably congratulate itself upon the showing it is able to make.

During the past year the company has derived much benefit from its virtual ownership of its own coal mines, both as to cost and as to its ability to secure coal when needed. During the coming year the company expects further to increase its use of coal obtained from its own mines.

It has been the practice of the company during past years to carry a substantial amount of coal in storage to guard against possible fuel shortage from any unforeseen cause. At the beginning of the winter the company had in storage

approximately 425,000 tons, being largely coal produced at its own mines. The policy pursued has enabled the company to carry on uninterrupted operation of its plants during the period of fuel stress with much less demand on general market supplies than usual. In addition it has been enabled during the most acute periods of the coal famine to help the community by placing at the disposal of the local federal Fuel Administrator substantial amounts of coal for general domestic consumption.

As partially set forth in the report for last year, 10 per cent of additional stock was offered to stockholders, for which quarterly payments were required on the first days of February, May, August and November, 1917. Stock certificates were issued on the latter date, thereby bringing up the total capitalization to \$50,422,826. The proceeds from the sale of this stock provided for additional plant capacity to take care of the increasing business. Owing to the high cost of labor and material, and to the patriotic duty which rests upon all corporations and individuals to conserve capital as well as other commodities while the war lasts, it will be the policy of the company during the year 1918 to curtail as far as possible all extensions of its plants and lines, and it therefore does not contemplate during the coming year any further issues of stock or bonds.

During the year 633 employees of the company entered the service of the United States government, being approximately 13½ per cent of the total number of men in the service of the company. The company can be proud of having so large a proportion of its employees in war service.

During the year approximately 31,000 new customers have been added, thus making at present a total of 351,700 customers. This represents an increase of 97,000 kw. in connected load.

The highest maximum load recorded at any one time during the year was 392,330 kw., which is an increase of 6 per cent over the highest load recorded during the previous year.

The company's connected business (exclusive of electrical energy supplied to other public service corporations) amounted to the equivalent of 15,336,791 50-watt lamps on Dec. 31, 1917.

ILLUMINATING ENGINEERING SOCIETY MEETS AT CHICAGO

M. Luckiesh States that Variety in Home Lighting Is
a Necessity and Should Be Thoroughly
Studied

In an address on "The Lighting Art" before the Illuminating Engineering Society, Chicago, on Feb. 21, M. Luckiesh told of the possibilities in home lighting. Fifty per cent of all lighting, he said, is used in the home and the householder does not appreciate that lighting will make the home more beautiful and a better place in which to live. Light is a medium that is real as pigment, continued the speaker. It may be used for decorative purposes by spraying light to get shade effects and is as effective and pleasing to the eye as any so-called decorations.

The subject of home lighting can be divided into two classes, namely, lighting that deals in facts and lighting that deals with fancy.

The following points showing why and how home lighting should be bettered were brought out by the speaker:

A necessity for variety of lighting, because every one demands variety.

Architects can increase use of light by specifying a greater number of outlets.

The electrical contractor can help by not decreasing the number of outlets specified, in order to reduce the cost.

The fixture manufacturers should co-ordinate art and science in design. Mr. Luckiesh stated that only 1 per cent of lighting fixtures now made combine the two ideal

principles. The fixture should be designed first for science and should then be dressed to give a good appearance.

The fixture dealer should arrange his store so that careful inspection can be obtained. The display room is usually a shower of fixtures arranged for economy of space rather than for artistic purposes.

The lamp manufacturers should put on the market lamps of different tints, tints that are light enough to be felt and not seen.

The fixtures should be so arranged that several sets of lights and shades could be obtained to fit in with the mood of a person at different times.

The decorator should make the walls of a neutral color so that the effects of the different tints can be obtained.

A number of slides were shown that gave the effect of tints of lights by shading the slides with different colors. An ideal dining-room fixture was shown which embodied several new features of fixture design.

"ELECTRIC FURNACES"

DISCUSSED AT CHICAGO

Joint Meeting of Chicago Section of American Institute of Electrical Engineers and Western Society of Engineers

"Electric Furnaces" was the topic of discussion at a joint meeting of the Chicago Section of the American Institute of Electrical Engineers and the Western Society of Engineers at Chicago on Feb. 25. The members of the Heat Treatment Club—a local body of steel engineers—had also been invited as guests of the engineering societies. The papers of the evening were presented by Thaddeus Bailey, president of the Electric Furnace Company of Alliance, Ohio, and John A. Seede, General Electric Company.

Mr. Bailey's paper was a discussion of the development of resistance-type furnaces of large capacity for operation at temperatures between 400 deg. and 1200 deg. Fahr. The paper brought out the tendency in furnaces of this type toward automatic operation and toward the use of the recuperative principle for making use of heat stored in the metal under treatment. Car-type furnaces taking as much as 600 kw. were illustrated and it was stated that a melting type of furnace now in course of construction for a Western zinc-smelting plant will take 1000 kw.

Annealing and heat-treating furnaces of the resistance type, the author stated, had met with favor more on account of the precision with which heat-treating operations can be conducted than on account of saving in cost over fuel-fired furnaces. In some cases a considerable saving has resulted over other methods, especially in the automatic furnaces, where the labor charge was greatly reduced. In other cases effecting a reduction in the number of imperfect pieces of work also made large savings.

In handling brass, however, these furnaces have without exception shown large savings over crucible or open-flame types, no matter how they were fired. The electric furnaces in handling brass will usually show a zinc saving of from 3 to 4 per cent over the open-flame type and a 2 per cent zinc saving over the crucible type. In the latter, however, the crucible costs are so high that an electric furnace will usually pay for itself in from three to four months even with electricity at 2 cents per kilowatt-hour. Moreover, the furnaces are of direct economic value, as they not only save money but also

save metal that would be lost forever if it were allowed to pass off in fumes.

Typical weekly running sheets shown by Mr. Bailey indicated that a 105-kw. tilting-type furnace making brass cartridge-case slabs could be operated on an average of 340 kw.-hr. per ton, including the heating-up losses.

Mr. Seede showed lantern slides following through the history of the development of the several types of arc furnaces. He spoke strongly for automatic control of arc furnaces, arguing the necessity for quicker action than human minds and hands can give. He also mentioned a new arc furnace installation which is to be operated at temperatures as high as 3300 deg.

The two papers were discussed by C. F. Bussy, Hoskins Furnace Company; J. Gardner, Illinois Steel Company; Douglas Walker, Booth-Hall Company; H. M. St. John, Commonwealth Edison Company; Alfred Hertz, Public Service Company of Northern Illinois; G. D. Hart, National Malleable Castings Company, and C. W. Pendll, Public Service Company of Northern Illinois.

Mr. Gardner stated that the two 15-ton and two 30-ton furnaces of the Illinois Steel Company were operating continuously and were giving no trouble. For the larger furnaces automatic control is very desirable, especially in the manufacture of gun steel and other products of superior grade.

OHIO TRANSMISSION AND DISTRIBUTION PEOPLE MEET

Cincinnati Conference Is Attended by Fifty Representatives from Ohio, Kentucky and Indiana Companies and Arouses Great Interest

The conference of the transmission and distribution committee of the Ohio Electric Light Association at the Hotel Gibson, Cincinnati, on Feb. 21, was the most successful meeting ever held by that organization. Fifty central-station men from Ohio, Kentucky and Indiana companies attended. All of the papers were enthusiastically received and brought forth a good amount of discussion.

A paper on "Shall Transformers Be Banked in a Distribution System?" by M. E. Grah, Toledo Railways & Light Company, discussed the transformer spacing, the percentage of rated load for which the primaries should be fused, whether or not the secondaries should be fused to prevent overload on any one bank of transformers, and what size this fuse should be. The paper contained data helpful in handling these problems.

E. D. Monk, Cincinnati office of the General Electric Company, presented a paper on standardization of transformers, pointing out the trend of the work of the National Electric Light Association, the Electric Power Club and of his company toward the establishment of standards in transformers.

A paper on cut-out problems by C. A. Harrington, Mahoning & Shenango Railway & Light Company, Youngstown, outlined definitely what the operating companies desire a cut-out to do.

The papers were discussed by W. E. Beatty, Cincinnati; G. M. Miller, Louisville; B. L. Chase, Columbus; I. L. Rankin, Chicago; J. W. Bryant, Cincinnati; M. H. Wagner, Dayton; F. R. Healy, Cincinnati, and Messrs. Conrad and Snyder.

Lack of Coal Stops Power in New Jersey

Active Industrial District in Northern Part of State Paralyzed by Inability of Company and Authorities to Get Coal

POWER shortage, due to coal shortage, is now a vital issue in the populous industrial district of northern New Jersey, crowded with manufacturing plants making war materials. Power has been shut off, stopping industries abruptly, because the necessary coal was unobtainable.

The Public Service Electric Company of Newark, supplying this busy district, is on such short rations that its entire service has been in almost constant peril. It has been obliged to stop service on various occasions, with the immediate result that industrial plants discontinued operation and the accompanying result that thousands of men were thrown out of work and production of essential war materials was delayed.

The district in which this situation has developed is not remote from railroad service, it is not far distant from mines abundant with coal. The generating stations of the Public Service Electric Company are accessible by both rail and water; the northern New Jersey district is a grillwork of railroads. Great coal-carrying systems—the Pennsylvania, Reading, Lackawanna, Erie, Lehigh Valley, Baltimore & Ohio, and Central Railroad of New Jersey—stretch their lines thickly through this region.

The story of the inability of the Public Service Electric Company to give continuous service to its thousands of industrial consumers is simply a story of coal shortage. It is a recital of facts that can be found in lesser degree in many central-station properties in different parts of the country, but which are intensified and revealed to public gaze by the extreme degree to which they developed in this case.

Here is a property with new stations, well equipped with thoroughly modern generating apparatus and distribution systems to meet the normal demands upon it. It is not a case of a company which has had to abandon the performance of its public duty because its system was inadequate to meet the load, or because its equipment was obsolete. Under broad policies of construction and co-ordination efficient stations had been created to meet the expanding business which was foreseen.

Yet the company, the Washington authorities and the New Jersey representatives of the Fuel Administration, individually and collectively, have been unable to provide the coal supply for the boilers which alone would have kept the vast industrial resources of the northern part of the State actively mobilized for war.

In its efforts to get coal the company has had a representative at Washington continuously. Many official and unofficial investigations have been made in an endeavor to accelerate relief.

One unofficial investigation of this character followed an acute condition of shortage as a result of which the company shut off about 50 per cent of the power usually furnished to consumers. The majority of the customers affected were commercial-power consumers. They included practically all of the large industries engaged in manufacturing war munitions or in other work incident to the war. A slight curtailment of

service on the lines of the affiliated Public Service Railway was also found necessary at that time. Since Jan. 1 the company has been dependent largely on the Shipping Board for fuel, but when this shutdown was enforced that board was unable to provide a supply. The small amount of coal received by the company from the mines had supplemented the other source of supply, and assisted in keeping the plants in operation. The total supply found at various generating stations was very small compared with the normal daily requirements.

HEARING BEFORE NEW JERSEY COMMISSION

At a hearing before the New Jersey Board of Public Utility Commissioners Thomas N. McCarter, president of the company, testified at length regarding the difficulties confronting the company.

The coal situation of the Public Service Electric Company has been acute for nearly a year, said Mr. McCarter. The company has a contract for coal for its electric plants with the Barnes & Tucker Coal Company, a large concern in the Pennsylvania coal field having several mines, for the exclusive output of four of its mines. The average tonnage, worked to capacity, of those four mines would give the company, if delivered, 900,000 tons of coal during the year beginning in March or April, 1917. The requirements for coal at that time were between 700,000 and 800,000 tons.

Not wishing to rely on that contract altogether, or have all the eggs in one basket, the company made other contracts with different coal contractors for lesser but still very substantial amounts, running to 100,000 or 200,000 tons apiece. Had the coal contracted for been delivered there would have been no trouble.

About a year ago, when the transportation difficulties began to be acute, Mr. McCarter went to Washington, accompanied by J. A. Pearson, purchasing agent of the company. They went to the Interstate Commerce Commission and then to the Railroad War Board. The latter board agreed to see that railroad cars were put into the Barnes & Tucker mine sufficient to carry to the company all the coal that those mines could mine. This was done, said Mr. McCarter, until it developed that there were mine troubles as well as transportation troubles. The coal miners are very largely foreigners from southeastern Europe. They are very independent. They are making, in most cases, larger wages than they have been in the habit of making, and hence are a little more independent as to the number of days in the week they work, their necessities being met by the advanced wages. The result was that it became impossible for the Barnes & Tucker company—and, as far as Mr. McCarter knows, any other coal miners in that district—to mine their full quota of coal during the year. The witness said that he thought that the Barnes & Tucker company had done its best, and he was sure the railroads had done their best in putting cars into the mines.

In the summer the Federal Trade Commission in Washington, acting in co-operation with Secretary Lane,

Essex Station

Marion Station

Essex Station
No coal in yard storage
Usually full of coal

Marion Station
No coal in yard storage. These black piles are ashes to be loaded on cars for removal. Usually this space is full of coal.

Perth Amboy Station

Burlington Station

fixed the price of coal at \$3 per ton at the mines. This price did not meet with the approval of certain other departments, notably the War Department, and that arrangement, which Mr. McCarter thinks would have been satisfactory to the miners and would have produced a far larger quantity of mined coal at that time, was upset and a subsequent price of \$2 or thereabouts was made. That has since been raised. Mr. McCarter added:

In this period a large amount of coal that was mined was shipped away from the United States to Canada by the coal operatives. We were endeavoring all this period of the summer to store coal, not only to get coal enough for our daily needs, but to store coal for the present day, foreseeing, as every operator of these properties does, that his winter season is the busy season, and the difficulties of coal transportation in winter are increased; but the most we could accumulate during the summer, owing to the causes which I have tried to outline, was 100,000 tons of coal, when the order came fixing the price at \$2.

We had opportunities to buy coal after that at varying prices named by coal men, which we declined to do because we believed it our patriotic duty to obey the mandate of the government and, inferentially, we didn't care to go to prison for not obeying. It was a state's prison offense to buy coal at the excess price as much as it was to sell it at the excess price. Some people did buy and sell coal at the higher prices, and we didn't.

The situation has been further complicated by the troubles of the winter. Some of our coal, some of our Barnes & Tucker coal, has been taken away from us by government mandate and sent to departments in Washington and forwarded to the Shipping Board. Many orders of that kind have been made, some of which we have succeeded in having canceled. About a month or six weeks ago I spent the major portion of the afternoon with Dr. Garfield in Washington, whom I have known many years, and he went over the whole situation thoroughly with me. He told me that the situation was very acute, but his last word to me was:

"Mr. McCarter, you will be taken care of. We cannot allow the Public Service to get out of coal."

He has been unable to keep that promise. I don't blame him for it. I don't know that anybody else would have done any better, but I simply state the fact.

Answering an inquiry as to the cause of the failure, whether lack of mining coal, transportation troubles or diversions, or all three, Mr. McCarter said:

I think it was due to them all, made acute by the severity of the winter and the transportation troubles that have taken place more recently. Owing to the weather conditions, our Barnes & Tucker and other coal began to fail us even to the extent we had been getting it. The Fuel Administration made every effort to help us. For the last three or four weeks since the earlier shutdown it had been keeping us going from day to day by diverting to our use coal in the tidewater pool consigned to other people, in some cases taking it away from ships in the harbor and in other cases taking it from other consignees; in all events, getting to us about the quantity we were failing to get owing to the other troubles.

On Saturday of last week, out of a clear sky, the Fuel Administration notified us that it would be unable to continue giving coal to us any longer, for two reasons—because it practically had no coal in the coal pool, and what it did have it was under peremptory orders from Washington to give to the ships in the harbor.

This found us with a mere pittance of coal for such a property as ours, and there seemed to be nothing to do but to notify the public of the necessity for the immediate shutdown, having enough coal in our bunkers to keep reasonable lighting going, and such power as to keep the elevator power in operation and a limited number of cars on the street, besides a small amount of power being used by the Shipping Board at Port Newark Terminal. I am speaking now of the northern section of the State. There is no shutdown in power, at the moment, in what is known as the Southern Division, from Trenton south, where we are going

on from hand to mouth, from day to day; but the shutdown I refer to is in the other division, embracing the northern section of the State.

The hearing then proceeded along the following lines

Commissioner Donges asked: "Is there any governmental agency, as far as you know, which could do anything to relieve the situation, or which is diverting coal to any other properties which ought to come to the Public Service, or are they, as far as you know, all being treated alike?"

The witness replied: "I think the Fuel Board—the Fuel Board has a great big job; it is being managed by a great many different men, as heads of departments, and I think they are treading on each other's toes. It seems to me foolish (and yet I don't like to criticize; we don't know all their burdens)—it seems to me Washington is straining every nerve to get coal to us and then stealing 100 tons of our coal from Tucker for somebody else. That is constantly going on. It does not seem to me in the Fuel Department there is very much co-ordination. I say it with a great deal of deference, and I have been considerate in the extreme of the whole question."

Commissioner Donges: "What I meant was whether, compared with what other industries were getting, you were getting your share."

Witness: "I think we are, and perhaps more."

Commissioner Donges: "That is what I had in mind."

Witness: "That is all. Shall I proceed?"

Commissioner Donges: "Yes."

Witness: "I am glad to have the opportunity of stating to the commission, and in the presence of these people, the facts I have stated. It is very annoying and distressing to all power manufacturers by reason of it."

Mr. King: "You made a remark to the effect that you hoped you would not have to keep closed down after you had accumulated a stock of coal, just now. Is it your thought that you will keep shut down until you accumulate a stock of coal?"

Witness: "Not any great stock. I don't like intermittent shutdowns, from one day to another. I thought if we stayed down a week more or less now we could accumulate more coal than we have had for the last two months, and with the breaking up of the winter, as we have had, we would be better off than by starting up the very first day and then perhaps shutting down the second day. But we are open to persuasion about that. Perhaps our view is wrong."

As indicated by the remarks of Mr. McCarter, the situation is beyond the control of the company. As this issue goes to press the company has succeeded in getting enough coal to resume full operation of its plants, although it is still moving on a day-to-day coal supply.

ELECTRICAL MEN PUSH WAR SAVINGS STAMPS

Committee of New York Apparatus and Supply Men
Report that About 75 per Cent of "Prospects"
Have Agencies

Considerable interest is being shown in New York electrical circles in the distribution and sale of war savings stamps. An electrical apparatus and supply division of the National War Savings Committee has been appointed for the greater city of New York, with offices at 195 Broadway.

The division committee, under the chairmanship of H. A. Halligan, vice-president of the Western Electric Company, is composed of R. Edwards, H. T. Hockhausen, M. A. Oberlander, G. L. Patterson, E. W. Rockafellow, C. P. Scott, P. L. Thomson and J. M. Wakeman. A. E. Beling is secretary.

M. A. Oberlander, who is campaign manager, states that about 75 per cent of the "prospects" have been induced to take out agencies for the sale of stamps.

Associations and Societies

The Directory of Electrical Associations, which is regularly printed in the first issue of each month, appears on page 495 of this number.

Los Angeles Synchronous Club.—Lecture No. 9 of the Synchronous Course on "Steam, Gas and Oil Engines" was given at the Feb. 21 meeting by J. W. Andree, department of generation, Southern California Edison Company.

St. Louis Jovian League.—In his address before the St. Louis Jovian League Feb. 19 Major John R. Fordyce, Engineers' Reserve Corps, constructing quartermaster in charge of the building of Camp Pike near Little Rock, Ark., showed conclusively the efficiency and dispatch with which the work was completed.

New York Electrical Society.—On Feb. 26 Major Frederick Palmer, Intelligence Section, on General Pershing's staff, presented a paper on "Our Army in France." Capt. Alexander Macomber spoke on "The Searchlight Regiment, the Fifty-sixth," and Major A. B. Kratz spoke on "The Electrical Regiment, the Thirty-seventh." This meeting was the society's thirty-seventh anniversary and its eleventh war meeting.

San Francisco Electrical Development League.—At a meeting of this association on Feb. 13 a new constitution was adopted and the name of the organization was changed from the San Francisco Electrical Development and Jovian League to the San Francisco Electrical Development League. The new constitution is so drafted as to make the organization entirely independent of any other and provision is made for developing it along broad lines. New officers elected for a term of one year, beginning March 1, are as follows: president, R. E. Fisher; first vice-president, H. C. Reid; second vice-president, C. P. Pitts, and new members of the executive committee, F. J. Bennett and Frank Roerber.

Minnesota Electrical Association.—The annual convention of the Minnesota Electrical Association will be held at the Hotel Radisson, Minneapolis, March 11, 12 and 13. In a statement issued by the officers and board of directors of the association concerning the convention it was stated that members were showing lively interest in it. The increasing difficulty of central-station problems makes especially timely all the advice and assistance that it is possible to get through an interchange of ideas. Among the important papers to be presented are "Minnesota Water Powers," by R. J. Thomas, superintendent of the St. Anthony Falls Water Power Company, and "Iron-Wire Transmission Lines," by Prof. W. T. Ryan of the University of Minnesota. H. E. Young of the Minneapolis General Electric Company is secretary-treasurer of the association.

Inter-Section Meeting of the A. I. E. E. and the A. I. S. E. E.—The three hundred and thirty-eighth meeting of the A. I. E. E., which will be held at Cleveland, March 8, is an inter-section meeting in which the Cleveland, Pittsburgh, Toledo, Toronto and Detroit sections of the Institute will participate. This meeting will be held in conjunction with the Association of Iron and Steel Electrical Engineers. The morning session will include a paper by George J. Newton on "Design of Underground Distribution for Electric Light and Power," and a paper by Robert F. Hamilton on "Some Considerations in Determining the Capacity of Rolling-Mill Motors." At the evening session J. D. Wright will present a paper on "Selection of Steel-Mill Auxiliary Motors and Control as Affected by Mechanical Features of the Drive," and the standardization committee of the A. I. S. E. E. one on "Steel Industry Motors Standardizing."

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Sales of Electrical Energy in New York.—The report made by the New York Public Service Commission, First District, to the Legislature says: "The most recent statistics for gas and electric companies are for the calendar year 1916. In that year gas companies in New York City manufactured and sold 44,565,753,000 cu. ft., an increase of 4.76 per cent. Sales of electricity, however, showed a very much higher percentage of increase, the enlarged use being accounted for in great part by the material reductions in Manhattan, the Bronx and Brooklyn. Increase in population was also partly responsible. Electric companies sold to the public 846,201,369 kw.-hr. and received therefor \$38,687,806, an increase of 16.40 per cent. Consumers numbered 360,669, against 306,217 in 1915. Gas sales were about \$6.61 per capita and electric about \$7.03 per capita."

Large Demand for Additional Service.—In its annual report to stockholders for the year ended Dec. 31, 1917, the Continental Gas & Electric Corporation, Cleveland, says in part: "Costs of coal, oil, labor and material reached during 1917 what is felt to be their peak and it follows therefore that the net earnings of your company for the past year are less than its normal earning capacity. Coupled with this is the fact that no advances were made in rates to consumers, so that in a year of average material costs net earnings on the common stock would have been approximately 8 per cent greater. Steps have already been taken to advance rates of the subsidiary companies 20 per cent. Profitable extensions are de-

manded on all sides. So desirous are many communities of receiving our service that they are offering bonuses which would, of course, increase the company's profit in such districts. Stockholders, therefore, are invited to make further investments in the securities of the company."

Electric Range Finds Cook Book Recognition.—Mrs. Ida C. Bailey, editor of the "Housewives' Forum" department of the *Pictorial Review*, has recently published a comprehensive cook book which is the first work of its kind to devote any considerable space to the electrical range as a practical unit in household kitchens. Through the efforts of Miss Grace Hadley of the Society for Electrical Development this favorable treatment of the electric range was included.

New California Hydroelectric Plant Put in Service.—The new hydroelectric plant of the California-Oregon Power Company on the Klamath River at Copco, Siskiyou County, Cal., has been put in service. It was dedicated officially on Feb. 2 in the presence of a small group of company officials, together with Prof. C. D. Marx, Stanford University; Prof. D. M. Folsom, Western Petroleum Administrator, and Captain Boyden, U. S. A. Construction work has been under way since 1911. When the site for the dam was stripped it was found necessary to excavate to a depth of 125 ft. before solid bedrock was encountered. The dam rises 125 ft. above the river bed and is approximately 500 ft. across the top. The plant ties in with the company's system serving Siskiyou and Trinity Counties, California, and all of southern Oregon.

New York Edison Savings and Loan Association Results.—With a total membership of 2453 and with assets of more than \$500,000, the New York Edison Savings and Loan Association has closed its sixth business year. A new item in the dividend schedule is the shares in military suspense created for the benefit of members, in the army and navy. To these members are apportioned dividends at the installment share rate so that they may have their installment holdings continued without penalty for non-payment during the war. Arrangements have also been effected to cover mortgage accounts of members serving Uncle Sam. The report of the treasurer showed total resources of \$547,437, an increase of \$121,666 over the previous year. This includes deposits by employees, totaling \$486,025. Dividends for the period ended Dec. 31, 1917, were: Installment shares, accumulative prepaid shares and shares in military suspense, 6.25 per cent per annum; saving shares, juvenile saving shares and installment shares in suspense, 5 per cent per annum. The following were re-elected for the ensuing year: Arthur Williams, president; A. A. Pope, vice-president; E. E. Bondy, corresponding secretary; Adolph Hertz, treasurer; J. C. Robinson, financial secretary. E. M. Van Norden, Albert Goldman, W. J. Meara and F. C. Henderschott were re-elected directors to serve for three years.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Illinois Rate Change.—The Illinois Public Utilities Commission has given the Central Illinois Public Service Company, Mattoon, permission to put in effect a rate of 11 cents per kilowatt-hour for residence lighting, this rate covering the first thirty hours, and 9 cents per kilowatt-hour for the excess. The ruling affects twenty-seven towns.

Preferred Stock at Net Price of 90.—The California Railroad Commission has authorized the Western States Gas & Electric Company to issue \$178,000 of 7 per cent preferred stock for not less than par, but with permission to allow 10 per cent commission. The proceeds are to pay current indebtedness as hereafter authorized by the commission. The company expended during eleven months of 1917 for improvements and the purchase of properties \$816,097.

Free Service Held Unjust Discrimination.—The Indiana Public Service Commission has entered an order denying the responsibility of the Interstate Public Service Company to continue giving free utility service to cities and towns where it operates under indeterminate permits, its former franchises from the cities and towns in question having been surrendered under the public utility act. The ruling is the first on this question by the reorganized commission. The Interstate company asked the commission for relief from further continuance of the practice of giving free service. A recent court decision gave the commission authority to deny free service to a town or city, it is held. The commission order held that such free service constitutes an "unjust discrimination against other consumers."

Reduced Rate in Brooklyn District.—On the recommendation of Commissioner Hervey, the New York Public Service Commission, First District, has ordered the Flatbush Gas Company to reduce maximum electric rates in the Twenty-ninth Ward in the borough of Brooklyn from 12 cents per kilowatt-hour to 10 cents for the six months beginning March 1, 1918, 9 cents for the succeeding six months, and 8 cents thereafter, that is, beginning March 1, 1919; from and after March 1, 1918, not more than 6 cents per kilowatt-hour for energy consumed in excess of two hours' average daily use of maximum demand. The order is to take effect on March 1, 1918. The Flatbush Gas Company serves the Flatbush area of Brooklyn with gas and electricity, but the order affects only the electric rate. The present maximum rate of the Flatbush Gas Company is 12 cents per kilowatt-hour.

Holding Company Control Denied in New York Case.—A decision has been given by the New York Public Service Commission, Second District, on the petition of the Kingston Gas & Electric Company for authority to acquire all of the stock of the Ulster Electric Light, Heat & Power Company and 775 shares of stock of the Upper Hudson Electric & Railroad Company. All of the \$700,000 stock of the Kingston company has been owned by the American Gas Company since 1902. Early in 1916 the American Gas Company, without knowledge or consent of the commission, purchased the entire outstanding \$30,000 stock of the Ulster company and 775 shares, slightly more than a majority, of the Upper Hudson company \$150,000 stock. The object was to consolidate the operations in the area of the three companies. "While the record discloses, and this commission is satisfied, that the American Gas Company acted openly and in good faith in the matter of these purchases," says the decision, "it is, nevertheless, the law of this State that, first, no holding company, domestic or foreign, shall purchase, acquire, take or hold more than 10 per cent of the total capital stock of any domestic gas or electrical corporation (with certain exceptions that are not germane to the particular point now under consideration); and, second, no gas corporation or electrical corporation shall directly or indirectly acquire the stock or bonds of any other corporation engaged in the same or a similar business, unless authorized so to do by this commission. . . . As to the proposed purchase by the Kingston company of the capital stock of the Ulster light company there seems to be no objection raised, and we are of opinion that the same properly may be approved. But purchase by the Kingston company of stock of the Upper Hudson company is strenuously opposed by practically all of the minority interests. While we do not accept all the conclusions of these interests as sound in either law or equity, we are unhesitatingly of opinion that . . . there is no proof in the case that the public interest will be advanced by approval of the proposed purchase. Ordinarily such purchases are justified by alleged economies in operation following a merger which is predicated as an essential part of the subject. But as matters stand there can be no merger in this case until the minority interests shall have been acquired; no proposition for a merger or consolidation of the Kingston company with the two others mentioned has ever been made by the present controlling interests, and it is expressly stated that while the American Gas Company desires to effect such consolidation or merger 'eventually,' it has no definite plans in regard thereto at present. We are not convinced . . . that to legalize continuance of such an unsatisfactory state of affairs through authorization of something merely not in itself illegal would be proper. Approval of the proposed purchase by the Kingston company of the 775 shares of stock of the Upper Hudson company accordingly should be denied."

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Death Brought About by Contributory Negligence.—Where a painter employed by a contractor to paint an iron smokestack used the restricted space of the roof of the substation of a power company as a place to rest his ladder when live copper power wires, uninsulated, sizzling and hissing with current were exposed to view, there being no necessity for the use of the substation roof as a place to rest the ladder, such painter was guilty of negligence contributing to his death by electric shock the Supreme Judicial Court of Massachusetts held in *Chartier versus Gardner Electric Light Company* (118 N.E. 263).

Indemnity in Concurrent Negligence.—Where defendant negligently allowed its high-tension wire to sag so that it burned through plaintiff railway company's trolley wire, causing it to fall and kill a horse, and plaintiff was required to pay a judgment in favor of the owner of the horse, plaintiff could recover from defendant, though they were joint tort-feasors, since while plaintiff might have adopted some precautions to protect the public, yet as between it and the defendant it could rest upon its rights; and was not required to make structures to protect itself from defendant's negligence, the Supreme Court of New York, Appellate Division, held in *Hudson Valley Railway Company versus Mechanicsville Electric Light & Gas Company* (167 N. Y. S. 428).

Right of Citizens to Inspect Municipal Records.—The District Court of Appeals in Los Angeles, Cal., has reversed a decision of the Superior Court and holds that W. C. Mushet is not entitled to a writ of mandate directing the Board of Public Service Commissioners of Los Angeles to allow him to examine the records and papers kept by this board in connection with the municipal power project. The board had appealed from the decision of the lower court on the ground that the Los Angeles Gas & Electric Corporation was the party beneficially interested in the suit, rather than the citizens and taxpayers of the city, and that Mr. Mushet was seeking to gain access to the records for the use and benefit of that corporation as a competitor of the city. The District Court of Appeals did not hold that a taxpayer really acting for himself might not examine the books of the Public Service Department, but held that a taxpayer only pretendedly acting for himself, but in fact acting for another person or corporation, had no right to maintain a suit for the purpose of gaining access to its records. The data sought were not public records as defined by the statute.

Harrison Williams has succeeded Samuel Scovil as president of the Cleveland Electric Illuminating Company.

James Favor has been appointed general manager of the Central Power & Light Company, Walnut Ridge, Ark., to succeed John F. Wilson.

F. C. Pratt, after spending six or seven months as manager of the Alliance (Ohio) Gas & Power Company, is again attached to the Doherty general engineering staff.

Terrell Croft has become connected with the Luminous Unit Company of St. Louis, Mo., as chief electrical engineer. Mr. Croft is well known as the author of several practical works on electrical engineering.

Albert R. Thompson, general superintendent of the electric distribution department, San Francisco district of the Pacific Gas & Electric Company, has gone to Camp Lee, Petersburg, Va., as captain in the Engineers' Reserve Corps.

M. H. Aylesworth has resigned as a member of the Colorado Public Utilities Commission, of which he was chairman, to become assistant to the vice-president and general manager of the Utah Power & Light Company. Mr. Aylesworth is a practicing attorney.

W. B. Miser, manager of the Oklahoma Gas & Electric Company, Drumright, Okla., has been appointed chairman for Drumright of the Military Training Camp Association, which has for its object the securing of competent men for inspection of equipment for the division signal corps.

J. M. Atkinson has been transferred from the post of manager of the Missouri Valley Light & Power Company, El Dorado Springs, Mo., to manager of the Big Horn Light & Power Company, Worland, Wyo. Prior to going with the Missouri Valley property, late in 1915, Mr. Atkinson was manager of the La Plata Light, Heat & Ice Company.

H. L. Thomson, assistant superintendent, has been appointed superintendent of the lighting department of the Hartford Electric Light Company, to succeed F. W. Prince, April 1. Mr. Thomson has been with the Hartford company for about six years and has been in close touch with both technical and commercial lighting work on the system, including the service of the model meter laboratory at the lately completed offices of the company.

G. McKew Parr, general sales manager of the Hart & Hegeman Manufacturing Company, Hartford, Conn., is on an indefinite leave of absence to serve under the War Trade Board, at Washington, as a volunteer worker. Mr. Parr, who is a graduate of the United States Military Academy at West Point, has been associated with the Hart & Hegeman company since 1909. For two years he represented the company in the Southern territory, when he became advertising manager, continuing in that position until early in 1914, when he was appointed general sales manager.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

R. E. Williams, formerly superintendent of the Little Rock Railway & Electric Company heating department, has been appointed assistant superintendent of the company.

L. E. Brown of Jackson, Mich., has been appointed superintendent of distribution for the Springfield (Ohio) Light, Heat & Power Company to succeed R. L. Gouty, who resigned because of ill health.

J. A. Perkins, formerly manager of the rate and statistical department, has been elected a vice-president of the United Gas & Electric Engineering Corporation. Mr. Perkins assumed his new office Jan. 10, and will continue the direction of rate and statistical matters.

P. T. Philips of the Little Rock (Ark.) Railway & Electric Company has been appointed general superintendent of both the electric and heat departments and will have full authority over power-house operation. This appointment is incidental to the merging of the heating business with the other departments.

Robert H. Whitten, after some five years of city planning work with the Heights of Buildings Commission and as secretary of the Commission on Building Districts and Restrictions and the committee on the city plan of the Board of Estimate and Apportionment of New York, has opened an office for consulting work on city planning and zoning at 277 Broadway, that city. Mr. Whitten was for some time librarian-statistician for the New York Public Service Commission, First District, during which time he contributed considerably to the technical press besides compiling a standard work on commission regulation.

G. A. Strain has been promoted from being superintendent of the gas department of the Helena (Mont.) Light & Railway Company to the position of general superintendent of the following properties, with headquarters at Ithaca, N. Y.: Homer & Cortland Gas Light Company, Cortland, N. Y.; Ithaca Gas & Electric Corporation, Ithaca, N. Y.; Norwich Gas & Electric Company, Norwich, N. Y.; Oneonta Light & Power Company, Oneonta, N. Y.; Standard Light, Heat & Power Company, Sidney, N. Y.; Van Wert Gas Light Company, Van Wert, Ohio; Cayuga Power Corporation, Ithaca, N. Y.; Groton Electric Corporation, Groton, N. Y.; Ovid Electric Company, Ovid, N. Y. Mr. Strain has been associated for the last twelve years with the operating organization of the J. G. White Management Corporation, New York City, the manager of the aforementioned companies.

George E. Erb has been appointed a member of the Idaho Public Utilities Commission, succeeding Axel P. Ramstet, former president of the commission, who resigned about a year ago.

Alfred C. Jordan, commercial manager of the Cumberland County Power & Light Company, Portland, Me., has been appointed superintendent of the railway, succeeding George S. Brush, resigned.

Loyall A. Osborne of New York, vice-president of the Westinghouse Electric & Manufacturing Company and chairman of the executive committee of the National Industrial Conference Board, has been appointed by the Secretary of Labor as a member of a committee on industrial peace during the war. This committee, which consists of five representatives of employers, five labor leaders and two public men, will provide a definite labor program in order that there may be industrial peace during the war, thus preventing any interruption of vital industrial production.

H. W. Fuller, who has been associated with H. M. Byllesby & Company for seven years, devoting a large part of his time to the solution of special operating problems, has been appointed vice-president in charge of operation of the Northern States Power Company, a newly created position. Mr. Fuller was born in New York and received his early education in the public schools of Bayonne, N. J., the State Model School of New Jersey and Rutgers College, being graduated in 1891. He entered the service of the Consolidated Traction Company of Newark, N. J., and became assistant superintendent and assistant general manager, leaving this position in 1901 to become general manager of the Washington Railway & Electric Company and the Potomac Electric Power Company. In 1911 he severed his connection with these properties to become associated with the Byllesby interests. He was appointed vice-president and general manager of the Appalachian Power Company, Bluefield, W. Va. The following year he went to Louisville, where, under General G. H. Harris, he had general supervision of the local Byllesby properties.

Obituary

Judson D. Holden, chief night electrician for the Aurora, Elgin & Chicago Railroad Company, was instantly killed a few days ago by an excessive charge of electricity.

L. R. McBroom, formerly superintendent of the Burlington (Vt.) light plant, died recently at the naval base, Norfolk, Va. At the time of his death Mr. McBroom was an electrical engineer at the government shipyards.

William Clegg, Jr., formerly district manager for the Westinghouse Electric & Manufacturing Company, with headquarters at St. Louis, died recently in that city. He was born in Franklin, La., and was graduated from the Louisiana State University at Baton Rouge.

of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

DISCOUNT CHANGES SCHEDULED FOR HEATING APPLIANCES

Greater Differential Between Central Stations and
Jobbers on Socket Appliances—Central Stations
Recognized in Range Discounts

A new schedule of discounts on electric heating devices has been arranged, effective April 1. It appears that the licensors in making the present readjustments of the schedules under the Marsh patents have had in mind granting to the central stations an improved discount relative to jobbers on electric ranges and on the other hand have improved the jobbers' discount relative to central stations on socket devices.

Under the old schedule the socket device discounts to central stations were 30 and 10 with an extra $7\frac{1}{2}$ for a bona fide order placed at any one time for \$5,000 worth of material for shipment within thirty days. Under the new schedule the basic central-station discount on socket devices will be 30 and $7\frac{1}{2}$ with an extra $7\frac{1}{2}$ for a bona fide order placed at any one time for at least \$5,000 worth of material for shipment within thirty days.

On electric ranges the former schedule to central stations of 25 and 10 (5 per cent for carload lot) with an extra 5 for a bona fide order placed at any one time for at least \$6,000 worth of material for shipment within one year will still be 25 and 10 (5 per cent for carload) for small orders, but for a bona fide order placed at any one time for at least \$10,000 the discount will be 25, 10 and 10 (5 per cent for carload).

The changes actually amount to increasing the differential between the jobbers and central stations by about 2 per cent on socket devices and to recognizing the quantity purchases of ranges by the central station. For some time the jobbers have been outspoken in the contention that the discount differential between the jobbers and the central stations was not great enough to insure a profit. The new schedules, it will be noticed, have not changed the differential between the jobber, the contractor-dealer and the department store.

On ranges there has been a disposition on the part of central stations, particularly those on the Pacific Coast, where the development of the electric range load has been large and rapid, and those others that are active on a large scale in the electric range business, to protest against a wider margin of profit for the jobber than for the central station, which it was pointed out assumes almost the entire retail development burden.

In making these changes in schedule on socket appliances the central stations purchasing heating devices in small quantities are placed on the same basis as the dealers and other merchants who purchase heating devices in small quantities for resale. The jobbers, on the other hand, who as the socket device business has developed have been recognized as becoming more and more the logical outlet in the distribution of socket appliances, are given an opportunity for making a better profit than under the old schedule.

On electric ranges it is apparent that the contention of the central stations that are purchasing ranges in large quantities and are conducting expensive campaigns for the introduction of the electric range, together with assuming the burden of exploiting the business, that they should receive the maximum discount on ranges, namely, the same as the largest jobber discount, has been recognized.

As was stated in these columns, there will be no schedule increase at the present time. Although the greatly increased costs seemed in many instances strongly to warrant higher lists, the licensors did not feel that an advance was just now advisable.

NEW FREIGHT ARRANGEMENTS TO IMPROVE TRANSPORTATION

With Few Exceptions, All Eastern Shipments Are
on a Priority Basis—Consignee, Not Shipper,
the One Considered

Early this year A. H. Smith, assistant to Director General of Railroads McAdoo, as a war emergency measure, created a "Freight Traffic Committee, North Atlantic Ports," for the issuance of inland shipping permits on export freight and also on all matters pertaining to domestic freight in its jurisdiction. A domestic division was also named, with offices in New York City.

For the present the domestic division will only assume control of carload domestic freight, embargoed as defined as follows, for Manhattan Island, the Bronx (New York City), and station or lighterage deliveries on New York Harbor: On Jan. 15, 1918, embargoes became effective on carload domestic freight (except food for human consumption, newsprint paper, live stock, perishable freight, coal and freight consigned to an officer of the United States government or to officers of the railroads); exceptions thereto will be covered by shipping permits to be issued by the domestic division, Freight Traffic Committee, North Atlantic Ports, and no railroad shipping permits will be issued except by the domestic division.

In observance of the procedure on carload domestic freight it is necessary that the consignee (not the shipper) shall make application for permit as follows: (a) For lighterage deliveries, to lighterage representative of the delivering road; (b) for pier, station or team track deliveries, to railroad representative at the delivery desired.

The lighterage representative or the railroad representative, as the case may be, will then present to the domestic division application for the issuance of railroad shipping permit for the forwarding of the freight from point of origin. Shipping permits will be sent to the consignee through the same channel. Consignee will send the permit to the shipper, which permit must be surrendered by the shipper to the initial road's agent, with bill of lading and shipping order. Permits will be issued under serial numbers bearing "F. T. C." prefix and waybilling agents must indorse on card and revenue billing reference to authority "F. T. C. No. —," otherwise cars will be rejected at junctions.

On Feb. 8, also, as a war emergency measure, the Pennsylvania Railroad system put into effect on all of its lines east of Pittsburgh a new plan of handling freight under embargoes. The purpose is to render every possible assistance to shippers and consignees in securing transportation of materials and supplies that are most urgently required, and also to simplify the procedure necessary to obtain authorization for the movement of essential freight in times of general embargoes.

The new plan will be applied to the administration of the present embargoes on the Pennsylvania lines east of Pittsburgh, as well as to all future embargoes that may be laid, until further notice. It will probably remain in effect for the duration of the war and as long thereafter as necessary.

Under the new plan, during the existence of an embargo, freight will be handled through a system of special permits covering each individual shipment. In this connection, a radical change will be introduced by which the consignee, and not the shipper of the freight, must apply for the permit. This changes completely the present system under which either the shipper or the consignee may apply for exceptions to embargoes.

The essential feature of the new plan is that before

authority will be granted to move freight affected by embargo the person who is to receive the shipment must demonstrate, to a reasonable degree, two things:

1. That the shipment is necessary to meet his existing requirements.
2. That he will be able to accept the freight promptly on arrival, unload the cars without delay and take the shipment off the railroad's hands.

In determining whether or not a permit shall be granted for a given shipment, two factors will control: (1) Road and terminal conditions existing at the time; (2) the urgency of the consignee's needs and his ability to unload.

In the past, where shippers instead of consignees frequently obtained permits, it was found that much freight was started on the road far in advance of the consignee's needs. It was also found that many shipments were made which the consignee was unable to accept upon arrival.

Much confusion and delay is expected to be obviated by this arrangement, which does not apply to export traffic via New York, Philadelphia and Baltimore, or to domestic carload shipments to New York. The latter is in charge of the Freight Traffic Committee above mentioned. No other railroad system has formulated a similar declaration. Increased transcontinental freight rates, which go into effect March 15, were granted by the Interstate Commerce Commission. These rates were asked for by the railroads prior to government control.

Conditions have improved in the East on deliveries, but they are far from normal. They are expected to reach that stage, weather permitting, about the middle of the month. Express and parcel post transportation is being used by shippers wherever possible, notwithstanding the extra cost, for emergency deliveries. The express companies are said to be literally swamped with business, and with the labor scarcity they find it impossible to handle it all.

METAL MARKET SITUATION

Copper in Small Lots in Good Supply—Official Price on Zinc Announced

Very little fluctuation is occurring in copper; that is as to supply or price. Producers and speculators are usually in a pessimistic frame of mind when discussing the amount of the metal coming from the mines and are doubtless sighing for a higher government price on the ground that it would stimulate production. The speculators are playing a good hand, when opportunity serves, a strong second, when it comes to boosting the market along price lines. It is evident, however, that there is enough copper for jobbers and sellers of less than car lots for commercial manufacturing uses. Wire manufacturers of rubber-covered, cable, weather-proof, insulated tape and other varieties are selling large bills to the government.

An official or government price has been established by the War Industries Board for zinc on practically the same conditions as control the sale of copper, subject to revision June 1. The minimum price is 12 cents per pound f.o.b. East St. Louis for producers; sheet zinc, 15 cents per pound, and plate zinc 14 cents per pound f.o.b. plant or smelter, subject to the usual trade discounts.

THE WEEK IN TRADE

FEBRUARY showed an increasing business over January in the volume and value of sales for all lines of staple electrical goods. A large proportion of this growing trade is due in great measure to the requirements of the government in its varied enterprises connected with the war. In fact, as has been noted before, this buying, in some instances on a gigantic scale, practically dominates every branch of the industry. On this account shortages are either imminent or a reality in lamps of various types, floodlamps, conduit, porcelain goods, etc. The civilian demand is strong for domestic appliances—heating and cooking equipment especially—dry batteries and vapor lamps. Freight embargoes East and West continue to hamper deliveries and in some cases cause uneasiness for needed stock, but improved weather conditions will doubtless relieve the present acute situation.

Collections are mentioned as being favorable with a weakness in connection with public utility accounts. Credits are held along firm lines.

NEW YORK

With a great deal of improvement in the clearing up of freight congestion at Atlantic seaboard points, particularly in and about New York City, yet no measurable relief is being afforded receivers of electrical equipment or the general line of merchandise. Where priority orders prevail for governmental needs goods have been given a preference and deliveries made. Notwithstanding the natural curtailment of trade on this score, business is reported in very satisfactory volume. The demand for electrical supplies and accessories of every description has not shown any falling away, according to the statements of representative jobbers and dealers. The difficulty of obtaining goods at a specified time is annoying and disturbing, and for the promises of manufacturers and distributors due allowance is made when fulfillment is lacking. Everybody is in the same dilemma, and therefore commendable patience and consideration seems to be the rule and not the exception.

From a financial standpoint the trade, as a whole, express satisfaction with collections, and some houses with numerous accounts are rather pleased they are in such excellent condition. A watchful policy is enforced on credits.

CODE WIRE.—With building operations not only at a very low level and still further restricted by the government, which advises that materials, labor and credit be not utilized for this purpose unless the need is urgent, the sale of code wire is not running into large amounts. Prices are at a stationary figure and likely to remain so.

DRY BATTERIES.—A fair business is reported in dry batteries. The supply has bettered, and jobbers specializing on these goods report strong stocks, with no variation in quotations.

LAMPS.—For a while the sale of carbon incandescents was large and increasing, but now, the trade states, the specifications are not so heavy as before the first of the year. The demand is dropping off, and the metallic-filament lamps receive preference in a majority of the important orders booked.

PIPE FITTINGS.—A short market is spoken of in describing the situation on pipe fittings. They go out as fast as received from the manufacturers, and it is difficult to buy, let alone accumulate stock.

INTERPHONES.—The demand locally is of considerable volume owing largely to a number of gigantic hotels now being erected, such as the Commodore, with 2000 rooms; the Pennsylvania, with nearly the same high rooming capacity, and several others, and to the shipyards in the harbor—

about forty besides those all along the coast—which are to be equipped. Local jobbers, as a rule, do not aim to bid on such contracts, as it would exhaust their stock, with poor expectation of early replenishment.

CONDUIT.—On large size it is almost impossible to obtain any stock, as the embargoes are holding up shipments from the producers. Both on non-metallic and metallic flexible conduit stocks are said to be low.

OUTLET BOXES.—A very satisfactory supply is held in this market. Prices have not changed, discounts ruling about the same for quite a while.

HEATING DEVICES.—A steady sale in irons is spoken of. In fact, in the regular line of household table and energy-consuming devices trade is all that could be expected, with prospects better as the spring trade opens. The new discounts, effective April 1, are given in another column.

ATTACHMENT PLUGS.—Jobbers report a business above the normal with no revision in the selling figures.

SOCKETS.—Standard sockets are said to be in good supply. On special makes, with fixtures for saving energy, a good sale, due to effective merchandising methods, is recorded.

PORCELAIN.—On cleats and knobs, for which the government has called in heavy lots, stock is not easily to be had. This applies also to everything on the list of staples which are being requisitioned officially for the equipment of either foreign or domestic military and naval establishments.

CHICAGO

The more pleasant weather which prevailed in the latter part of February and the nullification of the Garfield order seem to have permitted people to get back to work on a more serious basis. Buyers appear to be in the market to replenish stocks. There is every indication that February will show itself as a good month in the trade. There have been no price changes in the past week, but certain small changes are expected to develop shortly. The big event in the trade in Chicago in the last week was the meeting of the contractor-dealers to organize as a State association under the Pacific Coast merchandising plan. About 325 contractor-dealers, jobbers, central-station men and manufacturers attended the sessions of this convention.

WIRE.—One firm which has been selling partly on a 30-cent base, but on a slightly higher base for small quantities, is now entirely on a 30-cent base for rubber-covered wire. The manufacturers of weatherproof wire are telling the trade to expect higher prices on account of the higher prices of cotton. These manufacturers state that they would not be able at the present time to make the prices to the trade which they are quoting were it not for the fact that they bought cotton considerably in advance of requirements. A price change based entirely on the increased cost of cotton would not be large, it is thought, on account of the small amount of cotton per pound of weatherproof wire which enters into the manufacture. Nevertheless it is believed by some jobbers that it might affect the delivery situation on weatherproof wire, since cotton is very difficult to secure.

CONDUIT.—A study of conduit sales made by one Chicago jobber showed that during the month of December 61 per cent of the conduit shipped from his stock had been used for what was construed to be war purposes.

DOMESTIC APPLIANCES.—The demand which has been noted for lower-priced merchandise is said to be continuing until it has developed into a well-defined tendency in that direction. It is understood that the demand for lower-priced portable lamps will be met by one manufacturer, who is putting out a new line especially for this class of trade.

DRY BATTERIES.—The markets are absorbing practically all that can be manufactured and delivered. There have been persistent rumors about higher prices of batteries, but it is stated on good authority that there will probably be no increase at the present time, despite the fact that the cost of producing batteries is higher now than it has been in the past. There seems to be a desire on the

part of producers to keep battery prices as low as consistently possible.

ELECTRIC RANGES.—Orders are beginning to arrive from widely separated sections of the country, but it is noticed that most of the buying and inquiries is from central stations in the smaller communities. Nevertheless large shipments are being made in some instances.

BOSTON

Business holds up well with the larger jobbers, but a perceptible falling off is reported among the smaller houses. Well-informed opinion, however, regards the slackening as temporary. With the country hitting its full stride in war preparations, readjustments cause some uncertainty, but the absolute necessity of co-ordination among distributing agencies as well as in production insures the maintenance of a heavy volume of trade for the duration of hostilities. Stocks are increasing in many quarters and the larger establishments are already planning to meet the demands for electrical supplies and equipment which will accompany the construction of a new eight-million-dollar transatlantic shipping terminal at Boston by the government. Labor is uneasy this week in this district, strikes being threatened in Massachusetts telephone operators' ranks and on the Boston Elevated Railway. It is expected that the latter difficulty will be settled through arbitration and that local industry will not be further disrupted. Jobbers and retailers alike are rejoicing over the stoppage of workless Mondays, which have caused much disorganization and which threatened to lead to no little industrial emigration from New England. Collections are fair and deliveries improving somewhat on small motors, asbestos insulation and wire. This is apparently due to improved conditions at the factory rather than to better railroad service. A price advance of \$25 in Delco lighting sets was scheduled for March 1.

LAMPS.—Orders are now being well handled; portables are quieter, and lengthening days are curtailing service to the betterment of stocks. Bulk orders are not encouraged, however. Government business is exceedingly active.

WIRE AND CABLE.—Railroad conditions show no improvement as yet with respect to wire transportation. Prices remain unchanged, with rubber-covered wire quoted at 30 to 31 cents base and weatherproof at 28 to 29 cents. On quantity orders some manufacturers are quoting perhaps 4 to 5 cents less than the above in extreme cases.

CONDUIT.—Deliveries are reported worse than ever. Pipe from 2 in. up is in great demand, and one jobber stated that 3-in. and 5-in. conduit is almost worth its weight in gold at present. The government is a heavy buyer. No prospect of unloading large stocks of small-sized conduit as yet appears capable of realization.

MOTORS.—Smaller sizes are getting fairly plentiful. Prices are firm, and early advances have been rumored on single-phase outfits, but nothing can be found to support this view at the moment. Large motors are scarce, and a Boston dealer seeking eight 350-hp. machines for early service reports no success in filling the order. Delivery in six weeks is now quoted on motors as large even as 40 hp. and smaller sizes down to one week, with immediate shipment from stock on fractional motor orders in many cases.

DRY BATTERIES.—Three dry cells are now sold to one wet battery, one large dealer reports. Dry cells are quoted at 40 cents each in less than dozen lots, and 35 cents in the latter. No advance has occurred for three months. Flash-lamp business is quiet except for military use, but in a few weeks the stir of the vacation trade will begin to be felt.

FARM LIGHTING SETS.—These units are in good demand. A price advance of \$25 on Delco sets was scheduled for yesterday, making the 80-amp.-hr. outfit \$395, and the 160-amp.-hr. outfit \$465.

FIBER CONDUIT.—Central-station demand is very small, and the prospects are unfavorable except in the industrial field. Four feet to 6 ft. of frost will delay outside work somewhat this spring, it is felt.

EBONY BOARD.—Government demands are heavy; deliveries are somewhat improved, probably on account of increased factory facilities. Prices hold firm.

ATLANTA

The embargo on the Eastern railroads covering shipments for the Southeast is beginning to be keenly felt by the various manufacturers and distributors in this section. Quantities of electrical supplies have been received lately, but this was due largely to the fact that the freight in question had been started and was consequently moved out of the embargoed area. Moreover, these shipments were long overdue. The method of freight movements now in use, by which the railroads are permitted to receive freight on two days and to embargo on five, has helped to relieve the situation to some extent in individual cases; but on the average shipment, where no priority movement can be secured, the hardship is great and a number of important jobs are being delayed considerably. On the whole, the problem of deliveries covering all lines is more serious now than for some time.

Secretary McAdoo's expression regarding the financing of public utilities and the recommendation for higher rates was favorably received and came at a time when the needs of all public service companies are very pressing. While the necessity for higher rates and additional funds for extensions is great over all this section, the Atlantic and Gulf ports appear to be in the worst shape. The shipbuilding industry and the phenomenal demands for energy in all associated lines has placed a burden on these stations. It is expected, then, in view of the administration's policy along this line, that much-needed equipment will be purchased even in the face of long shipments.

BELL-RINGING TRANSFORMERS.—The demand continues steady. Shipments heretofore have been good, but stocks are getting low owing to poor deliveries to jobbers from the East.

HEATING DEVICES.—Activity in all lines is very strong and the volume of sales shows a slight increase over January.

TEXTILE MOTORS.—The call for this type of apparatus shows some stimulation over last week, manufacturers reporting a large number of inquiries and some good orders. This field is handicapped at present by the fact that most of the power companies are pretty well loaded.

CHARGING OUTFITS.—The market for these is excellent and trade is very brisk. Deliveries have been good.

SEATTLE

The volume of business generally was gratifying during the past week, with wholesalers and retailers showing increases over the corresponding week of last year. Sales over last week showed but a slight increase, except in the case of floodlamps, wiring devices and sewing machines, which continue prime movers. In domestic appliances, washing machines are selling well, and sales of electric irons show a slight increase. There is no noticeable increase in buying from government or industrial plants. The volume to shipyards increased slightly, particularly in Portland and Gray's Harbor. Stocks of motors, conduit of the larger size, wire and lamps are very low. There is no change in prices in any line worthy of comment and no strikes are imminent in the Northwest. Collections to date are satisfactory. Credits are well in hand.

Authorities agree that unless something is done to relieve labor shortage, there will be a smaller acreage under cultivation this year in the Northwest. Dire shortage is threatened in the agricultural sections on account of enlistments, the draft and the rush to shipbuilding cities. Business houses, including jobbers, will be forced to resort to female help or run short-handed. The government may have to enlist men for farm work, as it has for shipbuilding and lumber production. It is impossible to obtain household help. Dealers say this accounts for the heavily increasing sales of electrical labor-saving devices. Residence building and remodeling continues to increase in Tacoma, Seattle and other shipbuilding centers. Residence building in Portland is beginning to rush.

Freight destined for Seattle and Northwest points, held up in the East by embargoes against Western freight, has begun to move slowly, and there is a gradual increase in freight receipts. Contracts will be awarded shortly for two

additional units for cantonments at the Puget Sound Navy Yard and five units at Camp Columbia, near Vancouver, Wash. Plans for materially increasing the size of Camp Lewis, near Tacoma, are being formulated. The production of lumber the last week was 8 per cent of normal; shipments 71 per cent of normal.

FLOODLIGHTS.—Orders are pouring in faster than can be supplied. The biggest demand is from Portland and the Gray's Harbor shipbuilding districts. There is an extreme shortage of certain types. Prices have not advanced.

LAMPS.—There is a heavy movement and stocks are extremely low. The usual volume to the shipyards and industrial plants is supplemented by heavy buying for new construction. Prices are firm.

WIRING DEVICES.—These goods are experiencing a lively movement, with residence construction making fresh demands. Stocks are in fair condition; prices remain the same.

CONDUIT.—The demand from shipyards has decreased in the past two weeks, but the demand for new construction is increasing. Deliveries are causing considerable alarm. Shortages exist in jobbers' stocks. Apparently shipyards have ample for immediate needs.

FIXTURES.—The volume of sales by retailers is increasing daily. Indirect lighting is in great demand for new residences. Stocks appear ample.

SAN FRANCISCO

The past week has been noticeable for the first steady rain of the season, averaging 2 in. along the coast and 4 in. in the interior valleys. The rain was accompanied by a snowfall 3 ft. deep on the mountains, and the long line of snow-covered Sierra peaks was a most gratifying sight to central-station men.

However, the sale of pumping plants continues brisk, although hampered by diminishing stocks. Speedy replacement of sales is impossible because of the freight embargo placed east of the Mississippi River upon all commodities except foodstuffs and munitions. The time in transit required for cars to the Pacific Coast from Atlantic and central points is double what it was before the congestion, and with the rail tie-up it is evident that no early relief may be expected. Conduit stocks are very low with no prospect of improvement because of the war-time activities of the producing mills.

Electrical contracting business continues good, with plenty of small wiring jobs, in spite of the fact that early prophecies of 1918 conditions discounted such work in favor of industrial and governmental contracts. Rubber-covered wire sales are brisk, and the anxiously awaited shipments speedily melted before the back orders awaiting them. Factory shipments are fair. Interphones are evidence of the increase in private installations, for several jobs have been recently let in the interior cities.

Fuel shortage, the scarcity and high wages of household help and a feeling of personal sacrifice engendered by war conditions have united to form a wedge long needed to pierce popular ignorance and indifference to the merits of household electrical devices. The fuel situation, which cripples Eastern central stations, results in more business for California's hydroelectric plants. The officer in charge of the army hospital at Camp Fremont recently stated that were there another shortage of coal in the camp (the government having provided coal stoves) he would ask for an electrified heating and cooking equipment. The officials of the navy hospital, at Mare Island, have already made such a requisition. Camp Curry, an exceedingly popular resort in the Yosemite Valley, has just purchased two large hotel-type ranges, a 180-loaf baking oven and a hotel-size bread toaster, with a cottage radiator and water-heating system to follow. The Southern Pacific company intends to equip its fine modern hotel on the Apache Trail, near Yuma, Ariz., with an electrical kitchen grill and water-heating system.

So much for the larger equipment; but unless the mountain snowfall continues heavy and packs harder for frozen storage, there will be no organized campaigns for the sale of domestic ranges and water heaters this year.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Industrial Lighting Fixtures

The Luminous Unit Company of St. Louis, Mo., has developed the industrial light shown herewith, which is made in sizes to accommodate lamps ranging from 100 watts to 1000 watts. It is said that this unit is scientifically cor-

ADAPTABLE TO PRESENT LIGHTING EQUIPMENTS

rect in design, making possible high physical efficiency and at the same time eliminating all objectionable glare. This fixture is composed of two elements, an upper element of white porcelain enameled steel and a white porcelain enameled-steel reflecting cone suspended below the upper reflector in such a manner that all light above the angle of 40 deg. is intercepted and reflected to the working plane. This fixture can be attached to any socket in a minute and is adaptable to present lighting equipments.

Tool-Post Grinder

Gilfillan Brothers Smelting & Refining Company of Los Angeles, Cal., is manufacturing a tool-post grinder adapted for use on lathes. An angle

FOR USE ON LATHES

plate can be clamped around the tool post. There is a vertical adjustment of the grinder provided. This grinder

is equipped with a Westinghouse $\frac{1}{4}$ -hp. motor running at 3400 r.p.m. It is provided with a 6-in. by $\frac{3}{8}$ -in. (15.2-cm. by 0.9-cm.) grinding wheel, an extension mandrel for internal grinding fitted with a $1\frac{1}{2}$ -in. by $\frac{3}{8}$ -in. (3.8-cm. by 0.9-cm.) wheel, a tooth rest for cutter grinding and an electric attachment plug with $7\frac{1}{2}$ ft. (2.3 m.) of cord.

Automatic Knife Switch

The Electrical Engineers' Equipment Company of Chicago is now manufacturing a line of automatic knife switches. The switch proper is constructed according to the company's standard design, having double blades which are driven home over clip contacts, spring washers being employed to secure proper contacting. Normally

WELL ADAPTED WHERE CONTINUITY OF ENERGY IS IMPORTANT

the switch is closed into the upper contacts. These contacts are supplied from the customary source of power. In case this supply is interrupted a low-voltage coil operates, releasing springs which throw the switch blades into the lower row of contacts. These latter contacts are supplied from some independent source of power. When the normal source of energy is restored a bell alarm is sounded which is a signal for the attendant that the switch should be thrown manually into the upper contacts. The maker says that this type of switch is well adapted for use where continuity of energy supply is important. While the switch shown herewith is a 300-amp., 110-volt type, it can be made for all kinds of service.

Keyless Socket

Especially in millwork, it is frequently helpful to take advantage of the opportunity to place a larger number of lamps per circuit than the code permits for general wiring. In order to provide a keyless socket for pendent

FOR PENDENT DROP LIGHTS

drop lights wired with No. 14 portable cord, the Bryant Electric Company of Bridgeport, Conn., has added to its line of "New Wrinkle" socket caps one having a strain relief porcelain bushing with $\frac{1}{2}$ -in. (1.3-cm.) hole. The catalog designation of this socket cap is CB. When used in connection with the Bryant Company's No. 13 "New Wrinkle" keyless socket body, it provides a device that meets the conditions contemplated by rule 23-D as to inspection departments, the contractor and the customer.

Motor-Operated Therapeutic Machine

The Sanitarium Equipment Company of Battle Creek, Mich., has developed a motor-operated magneto which produces alternating current for medical purposes, including hydroelectric baths and automatic exercise. The equipment consists of an insulated table on which are mounted the driving motor, the magneto which generates the sinusoidal current, the interrupter, the speed and current controls and the connection posts.

A fractional-horsepower motor made by the General Electric Company is used. This drives the magneto through a leather-insulated friction disk. Speed is regulated and controlled by a hand screw which moves the motor on sliding-base rails to change the relative position of the friction disk on the motor shaft to the friction wheel on the generator or magneto shaft. The nearer the center of the disk the point of contact of the wheel, the slower the speed of the magneto.

Alternating current generated by the magneto is made and broken by a silent chain-drive interrupter which always acts at the same point in the wave in order to make the current painless. By the addition of a rotary converter on the magneto the cycles of the sin-

solid current all flow in the same direction, producing its characteristic waves.

This current is thoroughly insulated from that supplied to the motor via the lamp socket, and there is complete insulation to prevent the current supplied to the motor from reaching the patient.

Electrical Control for Calenders

A system of semi-automatic control for 115-230 volt, four-one-speed, double-voltage, shunt-wound motors for driving rubber calenders has been developed by the General Electric Company. The calender drive is operated through a master controller designed to give 115-volt or 230-volt operation with eighteen speed points on each voltage for speed regulation.

Throwing the master controller in one direction starts the motor on 115 volts, and the field is automatically kept at full strength during acceleration. The accelerating contactors are of the series-current limit type and have a load pick-up to insure that they will come in on light loads. When the final accelerating contactor closes the motor will further accelerate to the full weakened speed at which the controller is set.

If a still higher speed is desirable, swinging the controller handle in the opposite direction will put the motor on the 230-volt line, where armature and field acceleration will occur as on the 115-volt line, eighteen additional speed points being now available. There is no objection to starting directly on 230 volts if the operator so desires. Bringing the controller to the "off" position will allow the motor to stop.

A "safety first" feature of the equipment is the "quick stop" device. This is a small inclosed switch with a lever arranged to be operated by a rope which runs across the calender where the workman can easily reach it. When this switch is pulled all line circuits are broken and the calender equipment is brought to a very quick stop by means of three-point dynamic braking. The calender drive cannot be started again until the stop switch is reset.

The entire system is extremely simple. There is not an electrical interlock on the control panel. This is an important feature, as in previous methods of control which utilized electrical interlocking the sulphur in the rubber mills formed a coating in the interlock contacts, which at times prevented them from making circuit. Mechanical interlocks are used in the new system and afford protection against the possibility of contactors sticking in. The accelerating contactors have a self-contained operating and calibrating coil, and the contactor is cut out after operating.

The motor used for the calender drive is the type RF motor, which is applied in sizes up to 75 hp. for single-voltage and 125 hp. for double-voltage equipments. Where the single-voltage system is used either automatic or semi-automatic control can be provided.

Small Motor Switches

Here is shown an illustration of one of two switch condulets of the ZY series—the latest addition to the line of conduit fittings manufactured by the Crouse Hinds Company of Syracuse, N. Y. It is claimed that these condulets protect the switch operator and the person renewing fuses from shock; they cannot be operated by accident; they withstand the roughest usage; water will not drain into them, and it is impossible for lint or other inflammable particles to lodge upon the current-carrying parts and thus create a fire hazard.

Both the body of the condulet and its cover are cast iron. Inside is a combined 20-amp. snap switch and fuse block. The switch is externally operated, and its handle interlocks with the latch of the door in such a way that the latter cannot be opened when the switch is in the "on" position. As a result of this arrangement the circuit is dead when the door is open and fuses can be replaced without danger of shock or short circuit.

As the machine operator or any other person not skilled in electricity

TWO-GANG FORM

can change fuses with perfect safety in ZY condulets, their use prevents all the loss in productive time which is unavoidable where an electrician must be sent for to replace fuses. This in the course of a year means a considerable saving in the operating time of the average mill.

The manufacturers list ZY condulets in one-gang and two-gang forms and in sizes and arrangements of threaded conduit hubs to meet various conduit wiring arrangements.

Quartz Mercury-Vapor Lamp for Ultra-Violet Light

An improved form of quartz mercury-vapor lamp which embodies new features in construction and application is manufactured by the R U V Company of New York City. This lamp produces an ultra-violet component several times stronger than that yielded by other forms of quartz-mercury vapor lamps. The wave lengths of its light have been measured as low as 0.18μ , indicating a high degree of activity, it is claimed.

The lamp has an exceptionally clear crystal-quartz frame containing mercury, fitted at each end with terminals and provided with an unusually high vacuum. The cathode terminal of the lamp under running conditions contains

practically all of the mercury, as the pressure built up in the luminous tube forces the mercury back into the cathode end. The anode end is fitted with a tungsten terminal that is refined to a point approaching 100 per cent purity in order to prevent discoloration of the luminous tube.

This type of lamp is known as the "hot anode" type and differs from all other designs in that no mercury chamber is used at the anode end. This feature permits of operation of the lamp in any plane from vertical to horizontal, and therefore permits of application to practically any equipment used by the chemical manufacturer.

To support the mercury-vapor arc, as in the case of all mercury-vapor arcs ballast resistance is required, and such resistance is placed in series. When the lamp is started cold, about 20 ohms resistance is placed in series, but when the lamp is normally operating one-half of this resistance is cut out so that normally 10 ohms is constantly in series with the lamp terminals. This cutting out of resistance is accomplished automatically on a small switch-board that is provided as an accessory.

The starting characteristics of the lamp are therefore 8.5 amp. at 220 volts direct current, which is required normally for 10 to 15 minutes. As soon as the starting resistance of 10 ohms is cut out, the lamp, then being in normal running condition, consumes 3.5 amp. at 220 volts direct current.

Convenient Current Transformer

In towns where construction men are not familiar with "wiped" joints on ornamental lighting circuits the new General Electric current transformer for series circuits, with a union joint, is a great convenience. With the transformer it is not necessary to "wipe" the joints inclosing the gap between the lead sheath of the underground cable and the sleeves surrounding the cable

PROVIDED WITH STRONG UNION JOINT

going from the transformer. This device is provided with a strong union joint which, when screwed up tight, is entirely waterproof.

Trade Notes

THE HARTCOCK & WILCOX COMPANY of New York City has removed its Boston office from 35 to 19 Federal Street.

THE METROPOLITAN ENGINEERING COMPANY of Brooklyn, N. Y., has moved from New York City to 1250 Atlantic Avenue, Brooklyn, N. Y.

THE C. W. HUNT COMPANY, INC., manufacturer of coal-shoveling machinery, New York City, has removed its offices from 45 Broadway, to the Astor Trust Building, 501 Fifth Avenue.

THE MARRON MANUFACTURING COMPANY of Rock Island, Ill., has absorbed the Trio Manufacturing Company, which has been making a line of approved knife switches for years.

THE LIGHTOLIER COMPANY of New York City on Feb. 15 became the name of the New York Gas & Electric Appliance Company. All goods that it manufactures will be sold under the registered trademark of "Lightoliers."

THE DEPARTMENT OF COMMERCE of Washington, D. C., has published "Foreign Tariff Notes," No. 26, issued by the Bureau of Foreign and Domestic Commerce. The pamphlet has a special chapter on "Effect of the War on Tariff Policies."

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., announces the removal of its branch office from Phoenix to Tucson, Ariz. J. H. Knost and W. G. Wilson, the company's representatives, will have headquarters in the Immigration Building.

THE H. C. ROBERTS ELECTRIC SUPPLY COMPANY of Philadelphia, manufacturer of electrical supplies, has completed the removal of its establishment from 905 Arch Street to the new five-story building at the corner of Eleventh and Race Streets. The new location provides for increased capacity.

FRED WILMARTH will represent the Greusol-Quarfort Electric Company of Milwaukee, Wis., in northern Illinois and southern Wisconsin, with headquarters at Rockford, Ill. Frank W. Greusol, president of the company, who has looked after this territory heretofore, will remain at the home office.

THE H. W. JOHNS-MANVILLE COMPANY of New York City has opened a branch house in its new building, corner of Olive and Eleventh Streets, St. Louis, Mo. It is a six-story structure of modern fireproof construction. Whenever practicable the company's products were used in the finishing of the building.

THE SWAN & FINCH COMPANY of New York City has just celebrated its sixty-fifth birthday, having started in February, 1853, in a small way. At the present day the company has classified 103 industries in which one or more of its products are used. Its main plant at Bayway, N. J., covers more than 15 acres.

J. HOWARD SANDIDGE, who has been employed in the Chicago office of the Cooper Hewitt Company, has opened an office for that company in Milwaukee, with headquarters at 1011 Majestic Building. This change has been made in order to cultivate more intensively a territory with which Mr. Sandidge is familiar.

THE ESTERLINE COMPANY of Indianapolis, Ind., announces the appointment of the Northern Electric Company, whose main office is at Montreal, as exclusive distributor of Esterline products for the entire Dominion of Canada. The Northern company has branch offices in Halifax, Ottawa, Toronto, London, Winnipeg, Calgary and Vancouver.

THE DRIVER-HARRIS COMPANY of Harrison, N. J., regrets to announce the death of its treasurer, George J. Althen, on Feb. 15. Mr. Althen for the past four years had been connected with the company and was well known on account of his affiliation with the National Credit Men's Association. He represented New Jersey on the executive committee of that body.

THE NATIONAL LAMP WORKS OF THE GENERAL ELECTRIC COMPANY has purchased the automobile plant and land of the Abbott Corporation at Cleveland, Ohio, which is now in financial trouble. The plant is at One Hundred and Fifty-second Street and the Nickel Plate Railroad Company tracks. The consideration was about \$200,000. The deal includes a one-story building, 110 ft. by 681 ft., and five acres of land.

L. K. COMSTOCK & COMPANY, contracting engineers, announce the establishment of an office in the Union Trust Building, Washington, D. C. This action is taken by the Comstock company for the purpose of co-operating with the various government departments and general contractors in the execution of electrical and mechanical installations arising out of the government war construction program. E. C. van Cleaf and C. E. Stewart will be located in Washington for the purpose of rendering service to the various departments and contractors.

THE CUTLER-HAMMER MANUFACTURING COMPANY, Milwaukee, Wis., to insure service and every possible assistance to the various departments of the United States government, has arranged to station H. W. Knowles of its New York office permanently in Washington for the period of the war. Mr. Knowles entered the service of the Cutler-Hammer company shortly after being graduated from Cornell University in 1912. He spent nearly five years in the shop, engineering and sales department at Milwaukee. Since May of last year he has been connected with the New York district office. The Washington branch will have its headquarters at the Bradford, Eighteenth and K Streets.

New Incorporations

THE GARDEN CITY (KAN.) POWER COMPANY has been incorporated with a capital stock of \$750,000 by J. P. Nolan, F. A. Gillespie and J. S. McNamara.

THE SOUTHWESTERN ELECTRIC COMPANY of Tulsa, Okla., has been chartered with a capital stock of \$3,000 by C. D. Shamel, H. D. Maxwell and R. W. Shamel.

THE SHERIDAN STORAGE BATTERY COMPANY of Creston, Iowa, has been incorporated with a capital stock of \$20,000. The officers of the company are: L. J. Sheridan, president, and Harold Davis, secretary.

THE CENTRAL KENTUCKY LIGHTING & POWER COMPANY of Lexington, Ky., has been incorporated by E. L. Uncapher of Cincinnati, Ohio; W. I. Katterjohn of Paducah and Edward Johnson of Lexington, Ky.

THE CUMBERLAND ELECTRIC MANUFACTURING COMPANY of Memphis, Tenn., has been incorporated with a capital stock of \$6,000 to manufacture electrical supplies, etc. The incorporators are: M. W. Wilson, H. A. Beckmann and others.

THE AMERICAN BURGLAR ALARM COMPANY of Buffalo, N. Y., has been chartered with a capital stock of \$10,000 by C. J. and William Stroke of Buffalo. The company proposes to manufacture electric burglar alarms and kindred products.

THE THORP (WIS.) ELECTRIC LIGHT & POWER COMPANY has been chartered with a capital stock of \$10,000 by P. D. Kline, Donald Boyd and E. C. Dearth. The company proposes to take over the municipal electric-light plant in Thorp and enlarge same.

THE WEST SIDE ELECTRIC CONTRACTING COMPANY of New York, N. Y., has been incorporated by Samuel Berkowitz, S. Berkowitz and E. Jacobson. The company is capitalized at \$1,000 and proposes to do a general electrical contracting business.

THE WEBSTER ELECTRIC COMPANY of Racine, Wis., has been chartered by Walter Brown, P. G. Crewe and John B. Simmons. The company is capitalized at \$600,000 and proposes to manufacture small electric motors and electrically driven devices and appliances.

THE CUMBERLAND ELECTRIC MANUFACTURING COMPANY of Memphis, Tenn., has been incorporated by M. W. Nelson, H. A. Beckham, E. L. Nelson, J. S. Nelson and William C. Burton. The company is capitalized at \$6,000 and proposes to manufacture electrical supplies.

THE LOWENSTEIN RADIO COMPANY of New York, N. Y., has been incorporated with a capital stock of \$500,000 by F. Lowenstein, 397 Bridge Street, Brooklyn, N. Y.; H. G. Wilson, 233 Broadway, New York, N. Y., and A. Harris of Newark, N. J. The company proposes to manufacture wireless apparatus.

THE COLE STORAGE BATTERY COMPANY of Chicago, Ill., has been incorporated with a capital stock of \$100,000 by William Navigate, Samuel Goldfarb and H. A. Silverstein, all of Chicago, Ill. The company is capitalized at \$100,000 and proposes to do business in storage batteries and other kinds of batteries.

Trade Publications

LAMP GUARDS.—Harvey Hubbell, Inc., of Bridgeport, Conn., has prepared a leaflet descriptive of its Hubbell lamp guard.

LINE SPECIALTIES.—W. N. Matthews & Bro., Inc., of St. Louis, Mo., is distributing a catalog descriptive of its line-material specialties.

HEADLIGHTS.—The Ohio Brass Company, Mansfield, Ohio, has prepared a folder descriptive of its luminous and incandescent type of headlights.

FOREIGN TRADE INFORMATION.—The American Express Company of New York City has prepared a booklet descriptive of its foreign trade information.

TELEPHONE BRACKET.—The Northern Electric Company of Minneapolis, Minn., is distributing a leaflet descriptive of the Burns adjustable telephone bracket.

PUMPING UNITS.—The Allis-Chalmers Manufacturing Company of Milwaukee, Wis., has prepared a circular descriptive of its type "S" centrifugal pumping unit.

CIRCUIT BREAKERS.—The Roller-Smith Company, 233 Broadway, New York City, has prepared bulletin No. 500, descriptive of its inclosed type plain no-voltage circuit breakers.

FANS.—Century alternating-current stationary and oscillating desk and bracket fans are illustrated and described in a circular prepared by the Century Electric Company of St. Louis, Mo.

DISCONNECTING HANGERS.—The Thompson Electric Company, 5606 Euclid Avenue, Cleveland, Ohio, has prepared catalog B-17, descriptive of its Thompson safety disconnecting hangers.

DIES.—The Wells self-opening die is illustrated and described in a bulletin prepared by the Greenfield Tap & Die Corporation of Greenfield, Mass. The advantages of self-opening dies are pointed out.

REFLECTORS AND FIXTURES.—The George Cutter Company of South Bend, Ind., is distributing bulletin No. 3337, descriptive of its Sol-Lux industrial lighting reflectors and fixtures. This bulletin takes up the value of good industrial lighting, describes holder sockets, reflectors, industrial lighting reflectors, reflector-cap diffusers, one-piece reflectors, pendent fixtures, bracket fixtures and sign lights. This company has also prepared bulletin No. 3338, descriptive of its universal and standard flood-lighting projectors.

AMMONIA COMPRESSOR.—The De La Vergne Machine Company of New York City has prepared an attractive bulletin entitled "Ammonia Compressor Capacity." In this bulletin it is pointed out that 222 new-style vertical safety compressors of this company's make have been installed in place of old compressors during four years. A few letters from satisfied customers are appended. This company has also prepared a bulletin descriptive of its counter-current ammonia condenser, including information regarding two batteries of ammonia condensers at the plant of Wilson & Company, New York City.

SAFETY-SWITCH BULLETIN.—Safety auto-lock switches are described and illustrated in some detail in special publication No. 1586-A, just issued by the Krantz Manufacturing Company, Inc., of Brooklyn, N. Y. These switches are designed for use on circuits wherever the ordinary knife switch may be applied. They are especially designed for safety, it being absolutely impossible to touch the live parts regardless of the position of the switch or of the door. They are particularly adapted for use in steel mills, factories, mines and other similar locations where men are employed who have no practical knowledge of electricity.

CONDENSATION UTILITIES.—The Farnsworth Company of Conshohocken, Pa., has prepared an illustrated bulletin descriptive of its condensation utilities. The following apparatus are described: Duplex boiler feeder, duplex condenser-vacuum boiler-feed pump, duplex pumping trap, duplex condenser-vacuum pumping trap, direct-return condenser-vacuum trap, direct-return trap, pumping trap condenser-vacuum pumping trap, high-vacuum trap, separating or non-return trap, variable-pressure trap or combined pumping and non-return or separating trap, and variable-pressure condenser-vacuum pumping and separating trap. A chart showing the goal which can be saved by increasing the temperatures of the feed water by using the machines made by this company with closed system, or keeping the condensation under pressure, is given.

New England States

BRATTLEBORO, VT.—The Public Service Commission has granted the Twin State Gas & Electric Company permission to issue \$40,000 in bonds to cover extension of transmission lines in Brattleboro, Bennington and St. Johnsbury, and for improvements at its West Dummerston power plant.

ADAMS, MASS.—The Renfrew Manufacturing Company is contemplating the construction of a power plant to supply electricity to operate its several mills. The proposed plant, it is reported, will be located on Columbia Street, on the site now occupied by the old Broadley mill, from which electricity would be transmitted to the main mill in Renfrew and to those in the Maple Grove district of the town.

NEW HAVEN, CONN.—A new power plant is being erected at the plant of the Harlin Arms Corporation, Willow Street, in connection with the construction of a new factory building. Frederick T. Ley & Company of Springfield, Mass., has the contract.

Middle Atlantic States

HAVERNE, N. Y.—Walter H. Goehagen, c. 147 Remsen Street, Brooklyn, is planning to construct a shipbuilding plant at Haverne, including erection of one-story machine shop, 200 ft. by 300 ft., a wood-working shop and saw mill, 200 ft. by 300 ft., boiler house, etc., to cost about \$100,000.

BUFFALO, N. Y.—The City Council has authorized George H. Norton, city engineer, to engage a consulting engineer to report on the feasibility of constructing a hydroelectric power plant near Niagara Falls for the city, to cost about \$1,000,000.

BUFFALO, N. Y.—Arrangements have been made by the Westinghouse Electric & Manufacturing Company for the lease of a factory building, located at Milton and Harrison Streets, formerly occupied by the Standard Mirror Company. This building will replace the plant of the company on Locke Street, recently destroyed by fire.

JAMESTOWN, N. Y.—The erection of an electric power plant on the Jamestown Cotton Mills property is under consideration at the Crescent Tool Company. The present plans provide for the installation of a 100-kw. turbo-generator; electricity to be transmitted to the main plant at the corner of Harrison Street and Foote Avenue, which is now operated by gas (natural) engine power.

NEW YORK, N. Y.—Contract has been awarded by Kyle & Purdy, 282 King Avenue, City Island, ship and boat builder, for three-story addition to its plant on Fordham Street, 60 ft. by 180 ft., and the erection of a boiler house, 30 ft. by 50 ft.

NEW YORK, N. Y.—Plans have been prepared by H. Harlach, 451 East 144th Street, for an addition to the boiler house of the Arabol Manufacturing Company, 100 Hillam Street, New York City, on Sanford Street, near Flushing Avenue, Brooklyn.

HARRISON, N. J.—The Driver-Harris Company is contemplating rebuilding its plant recently destroyed by fire. Two buildings, one three stories, 40 ft. by 200 ft., and the other 25 ft. by 100 ft., will be erected. The company manufactures wire and wire products.

JERSEY CITY, N. J.—Recommendations have been made to the City Commission by the Department of Public Safety, Roger Boyle, fire chief, providing for extensive improvements to the fire alarm system, which include the installation of underground conduits to replace overhead wires, installation of gong circuits, to remove all fire houses from box or strait circuits; installing an auxiliary switchboard, and the installation of new fire alarm systems in all school buildings.

NEWARK, N. J.—The contract for the installation of electrical work for large warehouses and port terminals to be erected at Newark, N. J., by the United States Government has been awarded to the Grand Electric Company of Louisville, Ky.

SUMMIT, N. J.—Plans are being considered by the Commonwealth Water Company of Summit for the installation of a steam-turbine centrifugal type pumping unit having a daily capacity of 1,000,000 gal., at its Canoebrook pumping station. Frank C. Kimball is general manager.

CHESTER, PA.—To meet the increasing demand for power service the Delaware County Electric Company, controlled by the Philadelphia Electric Company, is constructing a large steam power station in Chester on the Delaware River. The new station is designed for an ultimate output of 120,000 kw., of which it is expected that an initial 60,000-kw. unit will be in operation by Aug. 1, 1918. This plant will supply energy to the United States government shipyards at Hog Island, now under construction and in partial operation.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

LEBANON, PA.—Preparations are being made by the Metropolitan Edison Company of Reading for the installation of a new rotary converter at its local plant.

PHILADELPHIA, PA.—Plans have been prepared for the construction of a new power house, 50 ft. by 60 ft., at 2626 Martha Street for the Cocoa Butter Manufacturing Company. Andrew J. Sauer & Company of Philadelphia are architects.

PITTSBURGH, PA.—Plans have been prepared for the installation of electrical, switchboard and heating apparatus in the proposed new five-story factory building of the Pennsylvania Chocolate Company.

CHARLESTON, W. VA.—The construction of a terminal station on Kanawha Street is under consideration by the Charleston-Dunbar Traction Company.

FIRECO, W. VA.—The Battleship Coal Company of Princeton, recently incorporated with a capital stock of \$150,000, contemplates the installation of a central electric power plant in connection with a coal and coke mining camp at Fireco. The project includes the erection of 50 houses for miners. H. E. Hines is president.

WASHINGTON, D. C.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, for the construction of a new one-story boiler shop, 100 ft. by 200 ft., at the Washington Navy Yard, to cost about \$81,100.

WASHINGTON, D. C.—Plans have been prepared by the Bureau of Yards and Docks, Navy Department, Washington, for the construction of a new substation and frequency changer house at the Washington Navy Yard, to cost about \$200,000.

WASHINGTON, D. C.—Contract has been awarded by the Bureau of Standards, Department of Commerce, Washington, D. C., to the Turner Construction Company for the construction of an industrial testing laboratory, 167 ft. by 350 ft., four stories, with two courts, 85 ft. by 107 ft., to cost about \$630,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until March 4 for furnishing and installing two 220-ton, one 100-ton, three 25-ton, three 20-ton, nine 15-ton, one 10-ton and two 5-ton overhead electric traveling bridge cranes at the navy yard, Washington, D. C. Drawings and specifications (No. 2775) may be obtained on application to the above bureau or to the commandant of the navy yard named.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until March 4 for furnishing and installing two 220-ton, one 100-ton, three 25-ton, three 20-ton, nine 15-ton, one 10-ton and two 5-ton overhead electric traveling bridge cranes at the navy yard, Washington, D. C. Drawings and specifications (No. 2775) may be obtained on application to the above bureau or to the commandant of the navy yard named.

North Central States

CLEVELAND, OHIO.—The Cleveland Electric Illuminating Company, it is reported, will build an addition, 105 ft. by 161 ft., to its power house on East Seventieth Street. New equipment, including a 25,000-kw. turbine, will be installed.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until March 8 for station transformers for the division of light and heat. Specifications may be obtained at the office of division of light and heat.

FLOODWOOD, OHIO.—The Central Electric Producing Company of Athens has started work on the installation of new equipment at its plant as follows: Additional boilers of 2000 hp., three 2500-kw., 2300-volt General Electric turbo-generators, with necessary transformers, switching apparatus and other accessories. J. T. Magruder of Nelsonville is superintendent of overhead distribution.

MANSFIELD, OHIO.—Negotiations have been closed whereby the Westinghouse Electric & Manufacturing Company has leased the plant of the Baxter Stove Company in Mansfield. The Westinghouse Company will take possession of the property immediately and will expend from \$20,000 to \$25,000 to equip the plant for the manufacture of electric ranges, electric heating stoves, electrical cooking devices, appliances, etc.

MARION, OHIO.—The Columbus, Delaware & Marion Electric Railway, it is re-

ported, will ask the city of Marion for a new 25-year franchise for the operation of the local electric-light plant and street railway system. Improvements involving an expenditure of about \$1,000,000 will be made to the power station and street railway system. Bonds to the amount of \$7,000,000 will be issued for improvements to the entire property, including the inter-urban road.

TOLEDO, OHIO.—The Toledo Electric Steel Company, it is reported, will construct a plant, 92 ft. by 350 ft., for the manufacture of high-speed and carbon tool steel. D. E. Rowe is president.

GREENVILLE, KY.—Plans are being prepared for the construction of a new central power plant, about 65 ft. by 80 ft., at the works of the W. G. Duncan Coal Company. Charles M. Means, Oliver Building, Pittsburgh, Pa., is consulting engineer.

RICHMOND, IND.—James P. Dillon, superintendent of the municipal electric-light and power plant, has made formal request to the City Council for an appropriation of \$200,000 for extensions to the municipal electric-light plant. Owing to the coal shortage several manufacturing plants are considering abandoning steam power next winter, provided the city can furnish the necessary electrical service.

GREAT LAKES, ILL.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until March 11 for construction of three brick buildings, including heating, electric-lighting and plumbing systems, at the Naval Training Station, Great Lakes, Ill., under specifications (No. 2816), as follows: A two-story radio quarters, about 46 ft. by 28 ft.; a two-story residence, about 26 ft. by 42 ft., and a post office building, 73 ft. by 48 ft. Drawings and specifications may be obtained on application at the above office or to the commandant of the naval station named.

HARRISBURG, ILL.—The Illinois Public Utilities Commission has authorized the Central Illinois Public Service Company of Mattoon to purchase the plant and property of the Southern Illinois Railway & Power Company of Harrisburg.

STEWARTSON, ILL.—Steps have been taken for the installation of a joint electric lighting plant with Strassburg. A company is being organized with a capital stock of \$35,000 to operate the proposed plant. Energy will be secured from the high-tension lines of the Central Illinois Service Company at Windsor. Stewartson already has an electric plant, but Strassburg is without lighting facilities.

MENOMONIE, WIS.—Estimates, it is reported, are being received by Thomas L. Thorson, mechanical engineer, Menomonie, for the construction of the proposed co-operative central steam heating plant at Menomonie, consisting of a brick and concrete building, 111 ft. by 174 ft., equipped with eight 1200-hp. boilers, with provision for four additional boilers, pump room, power room and coal bunkers equipped with automatic stokers, coal-handling apparatus, ash conveyors, vacuum system, etc. The initial installation will have a capacity of 1800 hp. and provide a radiation of from 350,000 to 400,000 sq. ft. Electric equipment may also be installed in connection with this plant and exhaust steam and electricity both be used for heating.

NEW LONDON, WIS.—Preparations, it is reported, are being made by Albert M. Mayo & Company of New London, to reopen the wood-working plant, formerly owned by Kenkel Manufacturing Company. A new 100-hp. motor-generator set will be installed. Electricity from the municipal electric-light plant will be utilized.

REEDSBURG, WIS.—Improvements are contemplated to the municipal electric-light plant, including the installation of a new electric generating unit of 250 or 300 kw., directly connected to either a uniflow engine or a steam turbine, this summer. Otto F. Luepke is superintendent.

THORP, WIS.—The Thorp Electric Light & Power Company, recently incorporated with a capital stock of \$10,000, will take over the local municipal electric plant. The new owners, it is understood, will enlarge the plant and improve the system. P. D. Kline is one of the incorporators.

BEMIDJI, MINN.—Bids will be received by the Minnesota State Board of Control, State Capitol Building, St. Paul, until March 12 for the construction of the State Normal School Building, including the general contract work, heating and ventilating, plumbing and electrical work. Separate bids to be submitted on each division of the work. Copies of plans and specifications may be obtained upon application to C. H. Johnson, architect, 715 Capital Bank Building, St. Paul.

CEDAR RAPIDS, IOWA.—Bids will be received by the Board of Education, Cedar

Rapidly, until March 11, for the construction of a high school building, including hot water heating, electric wiring, plumbing, vacuum cleaner, etc. The cost of the building is estimated at \$75,000. K. T. Snyder, 933 Plymouth Building, Minneapolis, Minn., is architect.

CONCORDIA, MO.—Plans are being considered by the trustees of St. Paul's College for the construction of a new power plant at the institution. Charles F. May, Merchants' Laclede Building, St. Louis, is architect.

GREGORY LANDING, MO.—The installation of a pumping plant, to cost \$75,000, exclusive of building, is contemplated by the Gregory Drainage District. Edmund T. Perkins, Illinois State Bank Building, Quincy, Ill., is engineer.

META, MO.—The installation of an electric-light plant in Meta is reported to be under consideration. Fritz Schallert is said to be interested.

ST. LOUIS, MO.—The St. Louis Malleable Castings Company is planning extensions to its plant, including the erection of a machine shop, forge shop, foundry, electric power plant, etc.

FARGO, N. D.—Bids will be received by the Board of Education of Fargo, N. D., until March 25 for the construction of a new high school building. Plans and specifications may be obtained on application to William B. Itner, architect, Board of Education Building, St. Louis, Mo. A deposit of \$50 will be required for plans covering the general work and a deposit of \$20 for plans for electric work.

UPLAND, NER.—Preparations are being made for the installation of a municipal electric-light plant, to cost about \$6,500, for which bids have been received.

FORT RILEY, KAN.—The local substation of the Union Light & Power Company of Junction City was recently destroyed by fire, causing a loss of about \$10,000.

LAWRENCE, KAN.—The Bowerstock Mills & Power Company, it is reported, contemplates the construction of a large boiler house soon. The company supplies energy to the Kansas Electric Utilities Company of Emporia to operate the local system.

OTTAWA, KAN.—The City Council is contemplating extending the electric transmission line on South Willow Street from Eleventh to Fifteenth Street, and then east in Fifteenth from Willow to Locust Street.

PITTSBURG, KAN.—Bids will be received by the Sisters of St. Joseph, care of Sister Superior Martini, Pittsburg, for construction of addition to the Mount Carmel Hospital, to cost about \$100,000. Separate bids to be submitted on heating, electric wiring, electric or hand power elevator, vacuum cleaner, plumbing, etc. G. W. Van Meter, 504 Caldwell-Murdock Block, Wichita, is architect.

POTWIN, KAN.—The City Council has adopted an ordinance granting the Kansas Gas & Electric Company of Wichita a franchise to install and operate an electric lighting, power and heating plant or a distributing system in Potwin.

Southern States

DUNN, N. C.—The General Utility Company, recently incorporated, is planning to install an electric plant, to cost about \$25,000. As yet an engineer has not been engaged. B. O. Townsend, Marvin L. Wade and G. M. Tilghman are interested.

CHARLESTON, S. C.—The Charleston Consolidated Railway & Light Company is considering increasing the output of its Meeting Street power house.

SPARTANBURG, S. C.—Plans are being considered by the South Carolina Light, Power & Street Railway Company for the construction of a new branch line to Camp Wadsworth, to cost about \$300,000.

SAVANNAH, GA.—The County Commissioners have granted the Chatham County Traction Company a franchise to construct and operate an electric railway from Stiles Avenue, on the Augusta Road, to the Brampton tract of the Foundation Shipbuilding Company.

HUMBOLDT, TENN.—Improvements will be made to the municipal electric-light plant, including the installation of a 300-kw. General Electric turbine, together with a Westinghouse La Blanc condenser and auxiliaries, about Aug. 1, 1918. W. M. Case is secretary and general manager.

NASHVILLE, TENN.—The Welch-Millard Company of Nashville would like to receive prices, etc., on second-hand drills and electrically driven pumps and a 60-kw. to 100-kw. generator with boiler and engine for delivery in 60 or 90 days.

MUSCLE SHOALS, ALA.—President Wilson has signed an order authorizing the

construction of a power dam at Muscle Shoals as part of the \$60,000,000 project for a government plant there for the fixation of atmospheric nitrogen for the use in the manufacture of munitions and fertilizer. The dam site has been offered to the government without cost by the Alabama Power Company, which has also agreed to transfer options on about 75 per cent of the land which would be affected by the overflow from the dam.

CONWAY, ARK.—The Council committee on light, heat and sewer systems has authorized E. W. Leverett, superintendent, to secure bids for the installation of a 150-hp. engine and generator for the municipal electric-light plant.

OAK GROVE, LA.—The Town Council of Oak Grove will accept proposals for thirty days for the installation of an electric-lighting plant and will issue franchise to parties with best plant and inducements. For further information address L. Grathwell of Oak Grove.

BLACKWELL, OKLA.—At an election to be held March 5 the proposal to issue \$82,500 for extensions to the municipal electric-lighting plant, \$77,500 for extending water-works system and \$15,000 for the purchase of fire-fighting apparatus will be submitted to the voters.

MADILL, OKLA.—The construction of a new plant in Madill is reported to be under consideration by the Consumers' Light & Power Company.

BOWIE, TEX.—An issue of \$15,000 in electric-light bonds has been approved by the Attorney General.

GRAPEVINE, TEX.—The Grapevine Light & Ice Company will install an entire new plant some time during 1918. It is proposed to enlarge the entire system.

YOAKUM, TEX.—The Yoakum Power, Light & Water Company is contemplating increasing its boiler capacity, also building additional water lines and installing additional water meters. John A. Donaldson is superintendent.

Pacific and Mountain States

BELLINGHAM, WASH.—The Puget Sound Traction, Light & Power Company is contemplating the erection of an electric transmission line to the Cokedale Mine to furnish 500 hp. to the plant there.

FERNDALE, WASH.—The British Electric Company, it is reported, is considering extending its electric transmission lines to Ferndale to supply electricity here for lamps and motors. The company also proposes to furnish electrical service to farmers in the Glendale district.

POMEROY, WASH.—The City Council is considering an application of the Pacific Power & Light Company for a franchise to supply electricity for lamps and motors in Pomeroy for a period of 50 years.

SEATTLE, WASH.—The Board of Public Works has changed the date of opening bids for a completed new power plant from March 1 to March 15.

SEATTLE, WASH.—The City Building Department has decided to erect the proposed power substation for the city lighting department at Fourteenth Avenue Northwest and West Forty-ninth Street by day labor instead of letting a general contract. Bids for material and sub-contracts will be handled through the city purchasing agent. The plans call for a two-story reinforced concrete building, 55 ft. square. Daniel Huntington, architect, has supervision of construction work.

SPOKANE, WASH.—Contract, it is understood, has been awarded by the Washington Water Power Company for a third generator (22,500 hp.) for its Long Lake plant to the General Electric Company.

DEL MAR, CAL.—The State Railroad Commission has authorized the sale of the electric distributing system of the Del Mar Water, Light & Power Company to the San Diego (Cal.) Consolidated Gas & Electric Company, for a consideration of \$11,055. The water system of the company is not included in the sale.

SACRAMENTO, CAL.—Application has been made to the Board of Supervisors of Sacramento by C. H. Slocum and R. A. Rose for a franchise to erect and operate an electric transmission line through Sacramento for a period of 50 years.

DUBOIS, IDAHO.—The Dubois Light & Power Company, recently incorporated with a capital stock of \$25,000, is planning to construct an electric plant to furnish electrical service in Dubois. A power site has been purchased on Beaver Creek near Dubois, where a dam 46 ft. wide at the top and 26 ft. high, will be built.

SALT LAKE CITY, UTAH.—The city

recorder has been instructed to advertise for bids for the installation of a special street-lighting system on Regent Street.

CHESTER, MONT.—Steps have been taken by local citizens to secure a better lighting system in Chester. It is proposed to have the Montana Power Company extend its service to the town.

HARLEM, MONT.—Bids will be received by the town clerk of Harlem until March 6 for the installation of an ornamental lighting system. Plans and specifications may be obtained on application to C. P. Wells, municipal engineer, Great Falls, Mont. Frank E. Meyer is town clerk.

COLORADO SPRINGS, COL.—The Golden Cycle Company is considering the construction of an electric power plant. At present the company secures electricity from the Colorado Springs Light, Heat & Power Company under a contract, which does not expire until 1920.

Canada

PRINCETON, B. C.—Work has been started on the extension of the West Kootenay Power Company's system across country from Greenwood to Princeton and Copper Mountain, a distance of more than 100 miles.

FRASERVILLE, ONT.—The City Council is considering a power development next summer in connection with the municipal electric-light plant and also other improvements to the system. E. Talbot is city clerk.

LONDON, ONT.—The London Electric Company, owned by the Mackenzie and Mann interests, it is reported, is planning to close down its power station on March 31. Unless taken over by the power controller the plant, it is said, will be scrapped.

MATTAWA, ONT.—The Mattawa Electric Light & Power Company is planning to make improvements to its waterwheel house this spring. T. H. Dougall is secretary and treasurer.

PARRY SOUND, ONT.—The city of Parry Sound is planning a 1500-hp. water power development in connection with the municipal electric-light plant as soon as conditions will permit. J. D. Broughton is treasurer.

ST. THOMAS, ONT.—A new distributing station was erected during 1917 for the municipal electric-lighting system, at a cost of \$40,000. The arc lamps now in use will be replaced with incandescent street lamps this year. Orders have already been placed for the equipment. E. H. Coughell is manager.

TILSONBURG, ONT.—The erection of a new substation in the near future is under consideration by the Tilsonburg Hydro-Electric Commission. M. G. Dean is mayor.

MONTREAL, QUE.—Work, it is reported, has begun on an extension from the main line of the Grand Trunk Railway to the Military Hospital at Whitby. This line, it is stated, will be equipped for electrical operation and will ultimately form a part of the electric lines to be built under the plans of the Hydro-Electric Power Commission of Ontario.

THREE RIVERS, QUE.—The Page Wire Company of Canada of Walkerville, Ont., which proposes to erect a plant at Three Rivers at a cost of about \$150,000, it is stated, will soon be in the market for equipment, including motors, etc.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until March 11, for iron or steel sheets, pipe straps, steel wire and cable, electrical switches, lighting projectors, copper cable, condenser tubes, etc. Blanks and information relating to this circular (No. 1201) may be obtained at the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until March 23 for furnishing generator sets, switchboards, copper cable, end bells, transformer connectors, terminals, receptacles, copper rod, busbar supports, pipe fittings, and floor flanges. Blanks and general information relating to this circular (1203) may be obtained from the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, New Orleans, La.

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, A. H. Krom, 29 South La Salle St., Chicago. Annual meeting, May 14, 1918.

AMERICAN ELECTRIC RAILWAY ASSOCIATION. Secretary, E. B. Burritt, 8 West 40th St., New York.

AMERICAN ELECTROCHEMICAL SOCIETY. Secretary, Prof. J. W. Richards, Lehigh University, South Bethlehem, Pa.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS, INC. Secretary, F. A. Molitor, 35 Nassau St., New York City.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, F. L. Hutchinson, 33 West 39th St., New York. Board of directors meets monthly. Sections and branches in the principal electrical centers throughout the country.

AMERICAN PHYSICAL SOCIETY. Secretary, Prof. A. D. Cole, Ohio State University, Columbus, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary-treasurer, Edgar Marburg, University of Pennsylvania, Philadelphia.

ARKANSAS ASSOCIATION OF PUBLIC UTILITY OPERATORS. Secretary-treasurer, Roy B. Fowles, Pine Bluff, Ark. Annual convention, Hot Springs, Ark., May 21-23.

ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES. General secretary, C. E. Dushin, 30 East 42d St., New York.

ASSOCIATION OF EDISON ILLUMINATING COMPANIES. Secretary, George C. Holberton, San Francisco, Cal.

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS. Secretary, John F. Kelly, McKeesport, Pa. Annual convention September, 1918.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS. Secretary-treasurer, Joseph A. Andreuccetti, Chicago & Northwestern Railway, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS. Secretary, W. L. Connelly, Gibson, Ind.

BRITISH COLUMBIA ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary, R. B. W. Pirie, 406 Yorkshire Building, Vancouver, B. C. Annual meeting, September, 1918.

CALIFORNIA ASSOCIATION OF CONTRACTORS AND DEALERS. Secretary, James W. Redpath, 505 Rialto Bldg., San Francisco, Cal.

CANADIAN ELECTRICAL ASSOCIATION, affiliated with N. E. L. A. Secretary-treasurer, M. C. Gilman, Toronto Electric Light Company.

COLORADO ELECTRIC LIGHT, POWER AND RAILWAY ASSOCIATION. Secretary-treasurer, T. F. Kennedy, 900 15th St., Denver, Col.

COMMERCIAL SECTION, N. E. L. A. Secretary, F. D. Beardslee, Union Electric Light & Power Co., St. Louis, Mo.

CONNECTICUT ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, George M. Chapman, Waterbury, Conn. Annual meeting, New Haven, Conn., May, 1918.

EASTERN NEW YORK SECTION, N. E. L. A. Assistant secretary, J. L. Hemphill, General Electric Co., Schenectady, N. Y.

ELECTRICAL MANUFACTURERS' CLUB. Secretary, Shiras Morris, Hart & Hegeman, Hartford, Conn.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION. General secretary, Franklin Overbagh, 411 South Clinton St., Chicago, Ill.

ELECTRICAL TRADES ASSOCIATION OF CANADA. Secretary, William R. Stavelly, Royal Insurance Building, Montreal, Can.

ELECTRICAL CREDIT ASSOCIATION OF THE PACIFIC COAST. Secretary, Albert E. Elliott, 502 Flation Building, San Francisco.

ELECTRIC POWER CLUB. Secretary, C. H. Roth, 1410 West Adams St., Chicago.

ELECTRIC VEHICLE SECTION OF THE N. E. L. A. Secretary, A. Jackson Marshall, 29 West 39th St., New York.

EMPIRE STATE GAS AND ELECTRIC ASSOCIATION. Secretary, Charles H. B. Chapin, 29 West 39th St., New York.

FLORIDA ENGINEERING SOCIETY. Secretary, J. R. Benton, Gainesville, Fla.

GAS, ELECTRIC AND STREET RAILWAY ASSOCIATION OF OKLAHOMA. Secretary-treasurer, L. W. W. Morrow, Norman, Okla. Annual meeting, May 1918, Oklahoma City.

GEORGIA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, Dan Carey, Atlanta Builders' Exchange, Atlanta, Ga. Annual meeting, June, 1918, Tybee Island, Ga.

ILLINOIS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, L. B. Van Nuy, Central Electric Co., Peoria, Ill.

ILLINOIS STATE ELECTRIC ASSOCIATION. Secretary, R. H. Abbott, Petersburg, Ill.

Directory of Electrical Associations

Printed in the First Issue of Each Month

ILLUMINATING ENGINEERING SOCIETY. General secretary, Clarence L. Law. Sections in New York, Philadelphia, Pittsburgh, Cleveland, Chicago and Boston.

INDIANA ELECTRIC LIGHT ASSOCIATION. Secretary, Thomas Donahue, Lafayette, Ind.

INDIANA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, George Skillman, Indianapolis, Ind.

INDUSTRIAL ELECTRIC HEATING ASSOCIATION. Secretary, Homer Kunz, Toledo Railways & Light Co., Toledo, Ohio.

INSTITUTE OF RADIO ENGINEERS. Secretary, David Sarnoff, 111 Broadway, New York.

INTERNATIONAL ASSOCIATION OF MUNICIPAL ELECTRICIANS. Secretary, C. R. George, Houston, Tex.

INTERNATIONAL ELECTROTECHNICAL COMMISSION (international body representing various national electrical engineering societies contributing to its support). General secretary, C. le Maistre, 28 Victoria St., Westminster, London, S. W., England.

IOWA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, M. T. Humphrey, Waterloo, Iowa.

IOWA SECTION, N. E. L. A. Secretary-treasurer, L. E. Caldwell, Iowa City, Iowa.

JOVIAN ORDER, Jupiter (president), Henry J. F. Strickland, Dallas, Tex.; Mercury (secretary), E. C. Bennett, Syndicate Trust Building, St. Louis, Mo.

KANSAS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, R. M. Sutton, Wichita.

KANSAS PUBLIC SERVICE ASSOCIATION. Secretary-treasurer, W. W. Austin, Cottonwood Falls, Kan. Annual meeting, Kansas City, Kan., Oct. 17-19, 1918.

KENTUCKY ASSOCIATION OF ELECTRICAL CONTRACTORS. Secretary, F. F. Valinoti. Annual meeting, May, 1918, Louisville, Ky.

LOUISIANA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, I. G. Marks, 323 Chartres St., New Orleans, La.

MAINE ELECTRIC ASSOCIATION. Secretary-treasurer, Walter S. Wyman, Augusta, Me.

MASSACHUSETTS ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, J. E. Wilson, 263 Summer St., Boston, Mass.

MICHIGAN SECTION, N. E. L. A. Secretary, Herbert Silvester, Detroit Edison Co., Monroe, Mich.

MINNESOTA ELECTRICAL ASSOCIATION. Secretary, H. E. Young, Minneapolis General Electric Company, Minneapolis, Minn.

MINNESOTA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, G. M. Jones, 112 South Seventh St., Minneapolis, Minn.

MISSISSIPPI ELECTRIC ASSOCIATION. Affiliated with the N. E. L. A. Secretary-treasurer, W. F. Wheeler, Hattiesburg.

MISSOURI ASSOCIATION OF PUBLIC UTILITIES. Secretary-treasurer, F. D. Beardslee, Union Electric Light & Power Co., St. Louis.

MISSOURI ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, A. J. Burns, 318 West Tenth St., Kansas City, Mo.

NATIONAL ARM, PIN AND BRACKET ASSOCIATION. Secretary, J. B. Magers, Madison, Ind.

NATIONAL ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary, H. C. Brown, 41 Martin Building, Utica, N. Y.

NATIONAL ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary-treasurer, William L. Smith, Concord, Mass. Annual convention, New York, March, 1918.

NATIONAL ELECTRIC LIGHT ASSOCIATION. Executive secretary, T. C. Martin, 33 West 39th St., New York.

NATIONAL ELECTRICAL CREDIT ASSOCIATION. Secretary, Frederic P. Vose, 1350 Marquette Building, Chicago, Ill. Annual meeting, June 1, 1918.

NATIONAL FIRE PROTECTION ASSOCIATION. Secretary of electrical committee, Ralph Sweetland, 141 Milk St., Boston, Mass.

NEBRASKA SECTION, N. E. L. A. Secretary-treasurer, R. W. McGinnis, O'Neil Light & Creamery Co., O'Neil, Neb.

NEW ENGLAND ELECTRICAL CREDIT ASSOCIATION. Secretary, Alton F. Tupper, 15 State St., Boston, Mass.

NEW ENGLAND SECTION, N. E. L. A. Secretary, Miss O. A. Bursiel, 149 Tremont St., Boston, Mass.

NEW MEXICO ELECTRICAL ASSOCIATION. Secretary-treasurer, E. A. Thiele, Roswell.

NEW YORK ELECTRICAL CREDIT ASSOCIATION. Secretary, Franz Neilson, 120 Broadway, New York. Annual meeting, June, 1918.

NEW YORK ELECTRICAL SOCIETY. Secretary, George H. Guy, 29 West 39th St., New York.

NORTHWEST ELECTRIC LIGHT AND POWER ASSOCIATION. Affiliated with N. E. L. A. Secretary, George L. Myers, Pacific Power & Light Co., Portland, Ore. Annual meeting, Sept. 11, 1918.

NORTHERN WHITE CEDAR ASSOCIATION. Secretary, N. E. Boucher, 743 Lumber Exchange, Minneapolis, Minn.

OHIO ELECTRIC LIGHT ASSOCIATION. Secretary, D. L. Gaskill, Greenville, Ohio.

OHIO SOCIETY OF MECHANICAL, ELECTRICAL AND STEAM ENGINEERS. Secretary, Prof. F. E. Sanborn, Ohio State University, Columbus.

OREGON ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary-treasurer, J. W. Oberender, 302 Dekun Building, Portland, Ore. Annual meeting, September, 1918.

PACIFIC COAST SECTION, N. E. L. A. Secretary, A. H. Halloran, Crossley Building, San Francisco, Cal.

PENNSYLVANIA ELECTRIC ASSOCIATION. State Section N. E. L. A. Secretary, H. M. Stine, 211 Locust St., Harrisburg, Pa.

PENNSYLVANIA ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, M. G. Sellers, 1518 Sansom St., Philadelphia.

PUBLIC SERVICE ASSOCIATION OF VIRGINIA. Secretary, W. J. Kehl, Virginia Railway & Power Co., Richmond, Va.

PUBLIC UTILITIES ASSOCIATION OF WEST VIRGINIA. Secretary, W. C. Davisson, West Virginia Water & Electric Co., Charleston.

RADIO CLUB OF AMERICA. Secretary, T. J. Styles, 152 Beach St., Yonkers, N. Y.

ROCKY MOUNTAIN ASSOCIATION OF MUNICIPAL ELECTRICIANS. President, Lawrence Stone, Denver, Col.

SOCIETY FOR ELECTRICAL DEVELOPMENT, Inc. General manager, J. M. Wakeman, 29 West 39th St., New York.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Dean F. L. Bishop, University of Pittsburgh, Pittsburgh, Pa. Annual meeting, Evanston, Ill., June, 1918.

SOUTH DAKOTA ELECTRICAL POWER ASSOCIATION. Secretary-treasurer, Frederick D. Brown, Huron, S. D.

SOUTHEASTERN SECTION, N. E. L. A. Secretary-treasurer, T. W. Peters, Columbus, Ga. Annual meeting, June 19-20, Atlanta.

SOUTHERN CALIFORNIA ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary-treasurer, J. E. Wilson, 425 Consolidated Realty Building, Los Angeles, Cal.

SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION. Secretary, H. S. Cooper, 403-4 Slaughter Building, Dallas, Tex. Annual convention, April 15-16, Galveston.

SOUTHWESTERN SOCIETY OF ENGINEERS. Secretary, C. E. Barglebaugh, 703 First National Bank Building, El Paso, Tex. Annual meeting, April, 1918.

TEXAS STATE ASSOCIATION OF ELECTRICAL CONTRACTORS. Secretary, H. S. Ashley, Fort Worth, Tex. Annual meeting, Galveston, Tex., June 15, 1918.

TORONTO ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, J. E. Myers, 3 Gould St., Toronto, Ont.

TRI-STATE WATER AND LIGHT ASSOCIATION. Secretary-treasurer, W. F. Steiglitz, Columbia, S. C. Annual meeting, Charlotte, N. C., April, 1918.

VERMONT ELECTRICAL ASSOCIATION. Secretary-treasurer, C. H. West, Rutland, Vt. Annual meeting, February, 1918.

VIRGINIA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, E. M. Andrews, Richmond.

WESTERN ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary, W. S. Boyd, 175 W. Jackson Blvd., Chicago, Ill.

WESTERN SOCIETY OF ENGINEERS, ELECTRICAL SECTION. Secretary, E. S. Nethercut, 1735 Monadnock Block, Chicago.

WISCONSIN ELECTRICAL ASSOCIATION. Secretary, George Allison, 1410 First National Bank Building, Milwaukee, Wis. Annual meeting, March 27-28, 1918, Milwaukee.

WISCONSIN ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, J. C. Staff, 575 Jackson St., Milwaukee, Wis.

(Issued Jan. 29, 1918.)

1,254,929. MEANS AND METHOD FOR METERING ELECTRICITY; Edmund O. Schweitzer, Chicago, Ill. App. filed March 6, 1916. Adaptable for use in the measurement of alternating-current supply and affording a basis for payment to the central-station company by the consumer for electrical energy furnished to and consumed by him.

1,254,951. STREET INDICATOR FOR STREET CARS; Adolf A. Winkler, Great Falls, Mont. App. filed Sept. 27, 1915. Relates to improvements in card, picture and sign exhibiting, and more specifically to street indicators for street cars.

1,255,445—Regulating Mechanism for Arc Lamp

1,255,026. ELEVATOR SIGNALING SYSTEM; Harry G. Lee, Tacoma, Wash. App. filed March 29, 1915. Improvements.

1,255,037. LEAD-WIRE TERMINAL; Bernard H. Oestricher, New York, N. Y. App. filed July 10, 1917. Improvement.

1,255,069. IGNITION DEVICE; Harry R. Van Deventer, Sumter, S. C. App. filed Sept. 18, 1917. Including electrodes, a magneto generator electrically connected thereto, and a tripped-spring-actuated mechanism for operating said generator.

1,255,084. SWITCH; William W. Dean, Chicago, Ill. App. filed Feb. 18, 1913. For telephone systems.

1,255,096. ELECTROLYTIC APPARATUS; George F. Jaubert, Paris, France. App. filed July 26, 1917. For the electrolysis of compounds, water for instance, from which gases are produced and are to be collected separately.

1,255,119. ELECTRICAL BOND; Edwin S. Slick and Charles W. Parkhurst, Westmont Borough, Pa. App. filed April 29, 1915. Improvements.

(Issued Feb. 5, 1918.)

14,430 (reissue). PARTY-LINE TELEPHONE SYSTEM; Henry Hovland, East Orange, N. J. App. filed Oct. 31, 1912. Improvements.

1,255,121. PIVOTAL JOINT BETWEEN AN ALTERNATING-CURRENT ELECTROMAGNET AND ITS ARMATURE; Albert Aichele, Baden, Switzerland. App. filed Dec. 30, 1916. Improvements.

1,255,126. ELECTRIC SWITCH; Clarence A. Bates, Bridgeport, Conn. App. filed March 27, 1917. Two-way type.

1,255,139. ELECTRICAL INSULATION; William T. Cushing, Milwaukee, Wis. App. filed Sept. 9, 1915. Relates to that class of materials employing an inert filler as a base and a varnish-like binder.

1,255,152. ELECTRIC SOCKET; Frederic P. Gates, Hartford, Conn. App. filed April 7, 1917. Applies particularly to extension sockets for candle fittings.

1,255,157. ELECTRIC SWITCH; Gilbert W. Goodridge, Bridgeport, Conn. App. filed Nov. 6, 1916. Means for cushioning the operation of the switch mechanism so as to lessen the noise usually incident to its operation.

1,255,175. VACUUM CLEANER; John B. Kellogg, Orange, N. J. App. filed July 10, 1916. Adapted to receive the inner end of a flexible hose to which a cleaning tool is attached.

1,255,176. WALL RECEPTACLE FOR VACUUM CLEANING APPARATUS; John B. Kellogg, Orange, N. J. App. filed Dec. 26, 1916. Embodies a quick-break switch suitable for directly interrupting the motor circuit of the suction cleaning apparatus.

1,255,180. TELEPHONE SYSTEM; Charles W. Keckler, Newark, N. J. App. filed April 26, 1917. Improved means for testing

Record of Electrical Patents

Notes on United States Patents

the busy or idle connection of a called telephone line.

1,255,181. FLUSH RECEPTACLE; Charles J. Klein, Milwaukee, Wis. App. filed Oct. 28, 1913. Receptacle and plugs therefor.

1,255,185. ADJUSTABLE SUPPORTING APPARATUS; William B. Lehmkuhl, Cambridge, Mass. App. filed July 13, 1916. Improvement.

1,255,197. CELL; John L. Malm, Denver, Col. App. filed April 16, 1915. Applies particularly to electrolytic cells utilized in treating metallic salts to drive off the gaseous anion and deposit the metal.

1,255,205. BRUSH CONNECTION FOR DYNAMO-ELECTRIC MACHINES; Charles P. Monto, Cleveland, Ohio. App. filed March 26, 1917. Flexible connections.

1,255,211. SYSTEM FOR THE SUCCESSIVE AMPLIFICATION OF ENERGIES; Alexander McL. Nicolson, New York, N. Y. App. filed June 8, 1915. Improvements.

1,255,225. ELECTRIC SWITCH; Guy R. Radley, Milwaukee, Wis. App. filed Dec. 8, 1911. Method of disrupting the arcs produced between the switch contacts.

1,255,241. COMPRESSION-OPERATED IGNITION DEVICE; Warren F. Stanton, Pawtucket, R. I. App. filed June 24, 1916. For use in conjunction with internal-combustion engines, pumps and other devices.

1,255,242. COMPRESSION-OPERATED IGNITION DEVICE; Warren F. Stanton, Pawtucket, R. I. App. filed June 24, 1916. Improvements.

1,255,248. SWIVEL FOR TELEPHONE BOXES; Alfred Toll, Kansas City, Mo. App. filed May 10, 1915. Device for facilitating the untwisting of the wire cord of an ordinary desk telephone.

1,255,250. RECORDING MECHANISM; James C. Warren, Emporia, Va. App. filed Jan. 11, 1916. Recording elements are operated by electromagnetic means.

1,255,264. TERMINAL COUPLING FOR ELECTRICAL CONDUCTORS; Charles W. Wright, Topeka, Kan. App. filed July 29, 1915. Improved connector.

1,255,277. ELECTRIC FIRE AND BURGLAR ALARM; Lewis E. Bates and Vellie V. Hanks, Houston, Tex. App. filed Nov. 10, 1916. The relay and the permanent magnet associated therewith are so utilized that a very small amount of energy will be required.

1,255,289. ART OF UTILIZING HIGH-FREQUENCY ELECTRIC OSCILLATIONS; David W. Brown, New York, N. Y. App. filed Aug. 9, 1916. Improvements.

1,255,310. WIRE-ENGAGING BATTERY TERMINAL; Albert E. Henderson, Middleton, Mass. App. filed March 15, 1917. Eliminates the binding post and screw.

1,255,326. ELECTRICAL HEATING UNIT; Arnold N. Macnicol, Melbourne, Victoria, Australia. App. filed June 16, 1914. Parts of which are readily detachable and renewable.

1,255,374. TELEPHONE SYSTEM WITH UNIVERSAL CORD CIRCUIT; Charles S. Winston, Chicago, Ill. App. filed July 30, 1914. Improvements.

1,255,387. PROTECTIVE SYSTEM FOR ELECTRICAL APPARATUS; Lewis W. Chubb, Edgewood Park, Pa. App. filed Jan. 5, 1916. Energy-absorbing means which are adapted to be connected across the terminals of the apparatus to be protected.

1,255,400. DYNAMO-ELECTRIC MACHINE; Ralph E. Ferris, Swissvale, Pa. App. filed Aug. 7, 1914. Arrangement of magnetic field circuits.

1,255,418. SYSTEM OF CONTROL; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed Sept. 21, 1915. Control of electric motors that are adapted for the propulsion of vehicles during the accelerating periods thereof.

1,255,419. CONTROL SYSTEM FOR DYNAMO-ELECTRIC MACHINES; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed Nov. 29, 1915. Method whereby motors may be accelerated and otherwise controlled in a smooth and uniform manner and with substantially sparkless commutation.

1,255,437. ELECTRODEPOSITION OF METALS; Frederick Laist and James O. Elton, Anaconda, Mont. App. filed June 16, 1916. Provides a simple means for determining the efficiency of the purification and the suitability of the solution for electro-deposition of the metal.

1,255,439. PROCESS OF RECOVERING ZINC FROM ORES; Frederick Laist and James O. Elton, Anaconda, Mont. App. filed July 10, 1916. Improvements.

1,255,440. PROCESS OF TREATING COMPLEX ORES OR CONCENTRATES THEREFROM; Frederick Laist, Anaconda, Mont. App. filed Nov. 3, 1916. Improvements.

1,255,441. ALTERNATING-CURRENT ELECTROMAGNET; David C. Larson, Yonkers, N. Y. App. filed Dec. 1, 1915. Consists in the proportioning of the secondary conductor and in the construction and relative arrangement of the core and conductor.

1,255,445. REGULATING MECHANISM FOR ARC LAMPS; George M. Little, Pittsburgh, Pa. App. filed Feb. 3, 1915. Improvements in the clutching and regulating mechanisms for such lamps.

1,255,447. MOTOR-CONTROL SYSTEM; Walter O. Lum, Wilkensburg, Pa. App. filed April 24, 1913. In which starting resistors are controlled by sets of automatically operated switches.

1,255,457. DYNAMO-ELECTRIC MACHINE; George H. Murray, Jr., Wilkensburg, Pa. App. filed Nov. 6, 1914. Relates to amortisseur windings.

1,255,475. CONTROL SYSTEM; Karl A. Simon, Wilkensburg, Pa. App. filed Dec. 4, 1913. Protective means for avoiding the effects of abnormal conditions in certain of the control apparatus.

1,255,486. DYNAMO-ELECTRIC MACHINE; Norman W. Storer, Pittsburgh, Pa. App. filed May 22, 1913. Special reference to railway motors of the twin-armature type.

1,255,487. DYNAMO-ELECTRIC MACHINE; Norman W. Storer, Pittsburgh, Pa. App. filed May 11, 1914. Direct-current railway service.

1,255,517. STARTING AND CURRENT-SUPPLYING SYSTEM FOR AUTOMOBILES; Thomas A. Edison, West Orange, N. J. App. filed July 31, 1912. Improvements.

1,255,531. ELECTRICAL SNAP SWITCH FOR WATER-PURIFYING APPARATUS; Harry B. Hartman, Scottsdale, Pa. App. filed Nov. 8, 1915. Automatic type.

1,255,535. ELECTRICAL SYSTEM FOR DISTRIBUTION; John W. Jepson, Depew, N. Y. App. filed Jan. 21, 1914. Car-lighting systems.

1,255,536. GALVANIC BATTERY; Heinrich H. M. Kammerhoff, Orange, N. J. App. filed Feb. 9, 1914. Improved arrangement whereby the necessity of insulating from each other the conducting containers of a pair of storage-battery cells composing a battery is obviated.

1,255,541. CASTING MACHINE FOR DENTAL WORK; Sigmund M. Lauter, Brooklyn, N. Y. App. filed July 3, 1914. Improvements.

1,255,552. SWITCHING MECHANISM; Carl P. Nachod, Louisville, Ky. App. filed Sept. 18, 1914. The closure or opening of an electric circuit or plurality of electric cir-

1,255,606—Dynamo-Electric Machine

cuits is effected in response to different relative angular positions assumed by members stepped or otherwise rotated in like directions.

1,255,589. TURBINE-DRIVEN ELECTRIC GENERATOR; Arthur S. Dysart, United States Navy. App. filed Dec. 21, 1916. Provision of novel means for collecting the current from the rapidly revolving rotor or armature.

1,255,606. DYNAMO-ELECTRIC MACHINE; William T. Hensley, Connersville, Ind. Improvements.

New Impetus Given to Hydroelectric Development

THE action of the President in signing the bill authorizing the hydroelectric development of Muscle Shoals on the Tennessee River in Alabama should kindle anew the interest of the people of this country in their water powers. This site, which has remained unused until now because of government inaction, possesses potentialities exceeded only by Niagara. Time and time again have attempts been made to develop the powers of the Tennessee River at Muscle Shoals and to improve navigation, and it is only through the patience and perseverance of the business men of the South that success was finally achieved. The West and other sections of the country may therefore take heart and petition in season and out of season until their undeveloped water powers, too, are harnessed for the service of man. It is only by throwing on the spotlight of reason and argument that the profligate waste of power in our watercourses will cease.

The Sociological Problems Confronting Us

MANY constructive minds are now at work on the sociological and other problems arising from the labor situation in the electrical industry. The war has brought a great change upon us, and it is well that industry and society in general should take cognizance of it. It must be apparent that no real progress can be made without the elevation of the character of the whole people. The wildest of Bolsheviks is no more harmful to the body politic than the reactionaries who, ignoring changed conditions, continue to play on passions which at length break out in the fire of revolution. The spirit of national service has cast into oblivion the idea of special privilege and class. Rather does it extend the hand of fellowship and of co-operation. The humanizing of industry is its chief function, and this carries with it the principle of joint industrial councils.

In all groups there are good and bad, in the moral sense. There are good lawyers and bad lawyers, good employers and bad employers, good engineers and bad engineers, good laborers and bad laborers. If the old clannishness of the professions does not disappear—and that quickly—the outlook is ominous. If all employers stick together as a class, the lawyers as a class, the industrial workers as a class, regardless of the good and evil among them, Heaven help us. But if the up-sweeping protest against the poker players of all classes destroys clannish proclivities and aligns the good against the bad, then we are saved. The hope of sal-

vation grows day by day. Our fight against a ruthless autocracy to which people are pawns has stirred our deepest age-old moral instincts.

Saving Public Utilities for War Service

BY RECOGNIZING the paramount needs of public utilities President Wilson places those properties under a deep obligation—not an obligation alone to him personally, but an obligation also to the public whose chosen leader he is, an obligation to the nation mobilized in the war for freedom of the world from German militarism. The President has no legal authority to compel state and local authorities to (in his words) “respond promptly to the necessities of the situation,” but he has a moral authority greater to-day than that of any other man on earth. His correspondence with Secretary of the Treasury McAdoo, published in last week's issue of the *ELECTRICAL WORLD*, is a historic milestone in the public utilities industries. May it bear fruit!

Our readers are generally familiar with the course of the proceedings which culminated in the letter of President Wilson. The committee representing electric, electric railway and gas utilities found that its problems were not ignored by national officials. It was fully appreciated that these properties are vitally essential in the war, that their costs of operation have been advanced heavily, that their securities have suffered severely in the markets. Comptroller of the Currency Williams and Secretary McAdoo sense the facts. Both of them see clearly that the credit and earning power of these great properties must be sustained to protect the entire banking fabric. Mr. McAdoo tells the President that the data presented by the committee “indicate the existence of genuine apprehension regarding the adequacy under present conditions of the service and rates of local public utilities.” Let there be no mistake on the part of any petty city or state official who mixes politics with true patriotism. “Our public service utilities are closely connected with and are an essential part of our preparations for the successful prosecution of the war,” says Mr. McAdoo.

There will be no permanent lessening of the demand upon electric utilities for power. On top of the overwhelming need for war industries we now have a clear indication that the Fuel Administration may urge the closing of isolated plants and the substitution of central-station energy so that every possible pound of coal may be conserved. Upon the showing of the facts, the national administration is using its vast influence to safeguard the utilities. It remains for the state and

local authorities to make vital the recommendations of the President, to grant rate increases wherever they are justified. And if there is more sympathetic co-operation on the part of the regulating bodies in meeting serious requirements due to the war, the obligation upon the utilities to make their service all that it ought to be, to keep it from being anything that it ought not to be, will be strengthened. The need is urgent, the response should be prompt.

Motor Drive in a Shipyard

EQUIPPING shipbuilding plants just now is emphatically a hurry job, and the use of electric power for the various drives involved has proved greatly to facilitate installation, not to say operation. David Elwell's account of the electrical drives installed for the Staten Island Ship Building Company describes a capital example of the way in which intelligent engineering brings its reward in quick and certain operation. The case is unusually interesting because this new plant for steel vessels is on the site of a wooden shipbuilding yard already equipped with a 220-volt direct-current plant. As noted in a recent issue of the *ELECTRICAL WORLD*, it was found desirable with the new equipment to contract for alternating-current service, so that the problem of suitable selection of alternating-current motors came to the front. At the start-off the 220-volt direct-current plant was, to save time, utilized in the plate shop, the first building erected. Individual drive has been adopted throughout in this plant. The character of the machinery and the circumstances of its use made it undesirable to attempt group driving, as is very likely to be the case in operating heavy machinery.

A study was made of power requirements of the machinery based on the performance of the direct-current motors, and it was found, as is very generally the case, that most of the machines were equipped with motors unnecessarily large for the service. The data thus accumulated made it possible to make an intelligent choice of alternating-current motors for the purpose. Most of the machines start running light, and it was found that the standard squirrel-cage motors were entirely adequate for giving good service. In a few instances—particularly with the punching and shearing machines, which run idle and then deliver power almost instantaneously—another type had to be chosen. Machines of this class, to escape extremely high demand on the motor during the power stroke, are best fitted with flywheels, and the ordinary squirrel-cage motor fails to meet the necessities. For cases of this kind a squirrel-cage motor with high-resistance end connections was found to fill the bill excellently, giving sufficient starting and accelerating power without the complication of slip-rings. Only a few of the motors needed to be equipped with compensators, so that the whole motor plant is reduced to extremely simple terms.

At the voltage selected, 220, oil switches were unnecessary, and this again simplified the switching needs of the plant. In order to take the large starting currents required on the type of motor used the switches had to be heavily fused, but the character of the work is such that there is little chance for serious overloading of the individual motors belted to the machines in spite of the big fuses. The whole plant is wired in iron

conduit, lighted by general illumination above the level of the crane, and affords an excellent example of emergency work quickly and skillfully done.

Saving Second-Hand Line Material

CONSIDERING the prices to which line material of every kind has risen within the last two or three years, the need of checking waste of every sort is obvious. A central station cannot afford to throw away or sell for a nominal figure anything which can be put to good use and will so save the cost of new material. A brief discussion of the situation by L. M. Klauber gives some very useful hints as to the ways in which second-hand line material can be effectively utilized. Some of these ways are altogether familiar, like cutting down and resetting poles. Others are not so universally practiced and deserve especial attention. Poles, of course, are the chief item of distribution-line renewals. The classification of old poles here made is a serviceable one. They are divided into three groups—those which can be replanted after the bases have been treated, those too short or light to be again used in the standard construction, and those so far gone as to have no value as carrying poles at all. With judicious inspection a good many poles can be reset on outlying lines or even where they are. Decay is usually at the ground line, and sawing them off above the line of decay and treating the new base, preferably by tank treatment, may very often make a pole capable still of a good many years' service.

Poles removed by reason of being too light for new conditions can still be used on outlying lines as poles for service lines and in similar ways. Those too light even for this service but in otherwise good condition can sometimes be utilized for telegraph and telephone construction in rural districts. Finally, the poles too far gone to cut down can find divers uses as guy stubs, braces, dead-men, and even fence posts, for all of which purposes they are worth more than mere waste wood.

Cross-arms present a tougher proposition. They may be in excellent condition, but are likely to be too short or too small to be easily put to use. Here again arms too light for electric light wires may be of value in building the extension of a country telephone line, for occasional house services, and for offset arms when too short for regular work. At the worst they may, like the stubs of poles, be utilized for rough construction work, and last of all for firewood, it being the common experience that discarded poles like discarded railway ties do not furnish convenient or high-grade fuel, although considerably better than nothing.

Old wire, which used to be almost universally sold for scrap, is now worth too much to put to such base use. If of the weatherproof kind, it is apt to be in bad shape before being taken down, but it can be skinned and as bare wire may serve a new term of usefulness. Old splices, of course, are overhauled and inspection made for kinks and weak spots. Short lengths make good tie wire in the smaller sizes, and in the larger sizes they are available for grounding neutrals and short connections of various kinds. Insulators are more troublesome than either wire or poles, unless they are of a size which can be worked in on secondary systems for services. Second-hand porcelain insulators, being

f a somewhat special kind, are less likely to be useful. To a certain extent the insulator pins and bolts taken down from a line may be utilized again readily if of standard size, but only at some little inconvenience if not of such size. And so one may go on.

Unipolar Induction Theory

THE December number of the *Physical Review* contains an article by Prof. George B. Pegram on "Unipolar Induction and Electron Theory." The article describes certain experiments on unipolar generator apparatus and analyzes the results obtained.

The first little unipolar direct-current generator was brought out by Faraday. Ever since that time the unipolar machine, or acyclic generator, has been recognized as a generator of continuous currents without needing a commutator. In recent years many such machines have been constructed in different types, although mostly in small sizes. There has been a perennial controversy carried on as to the correct way of explaining the action of some of them. A typical example consists of a cylindrical permanent bar magnet rotated by power about its axis and having two stationary brushes applied to its rotating surface. One of these brushes is placed, say, at or near the mid-length of the magnet. The other is applied near to one end of the magnet. These two brushes form the generator terminals and are connected by an external circuit in the usual way. A current is observed to flow in the circuit, say into the middle brush, through half the magnet and out from the end brush. The question agitated has been whether the emf. is generated in the substance of the rotating magnet, in spite of the fact that if the magnet carries its magnetic field around with it like a broom this field cannot cut the moving substance. Or is the emf. generated in the stationary part of the circuit external to the brushes?

The article pronounces in favor of the emf. being generated in the substance of the moving magnet. The reasoning is conducted in terms of the electron theory, but it may of course be presented in other terms. The emf. generated in an element of a conducting circuit may be produced either by a real rate of change in the vector potential at that point or by the transverse motion of the element with respect to a magnetic field. It is not necessary in the latter case that the field should be stationary. The field may or may not be in motion. If the conducting element moves, an emf. will be generated therein by the field. According to this deduction, a bar magnet generates an emf. in its own substance

when it rotates. It is not an essential question whether the field rotates with the magnet or not. The only essential fact is that elements of conductor are moving, and they are also permeated by a transverse magnetic field.

Business Men Indorse Daylight Saving

A PRESS bulletin issued by the Chamber of Commerce of the United States brings once more before the public eye the question of daylight saving which is provided for in the Calder bill now before committee. We have several times taken up this subject and have adhered consistently to the opinion that it is an interesting and probably useful program, not likely to produce any notable results on the prosperity of the lighting industry, and to which the only material objections are the possible inconveniences that would be felt at certain places owing to the division of the country into time belts each extending over a considerable range in latitude.

The results obtained last year abroad were very various, according to the reports from different regions, but on the whole there is general agreement that the plan worked out very well and did not involve material inconveniences. The actual saving in fuel which may be obtained cannot safely be predicted since much depends on the completeness with which the general habits of the people adjust themselves to a new clock time. It will be hard in fact to estimate the real results even after a year's trial, since they will vary from city to country and will be profoundly influenced by the increasing amount of work in three shifts which is now going on in war industries and which obviously will not be materially affected one way or the other by the change. In certain communities one of the advantages pointed out in the bulletin will prove to be of considerable importance for a portion of the period involved; that is, the separation of the transportation and lighting peaks, which are now commonly nearly coincident.

The experiment is well worth trying for the sake of uniformity and on the strength of foreign experience, if for no better reasons. There do not seem to be any substantial arguments against it, since trials elsewhere have failed to develop any. If Congress thinks it wise to inaugurate the change, we trust that it will act promptly enough to have the experiment begin by the middle of April, and not allow the proposition, as last year, to drag on until really too late for action.

SHORTAGE of coal and the fact that fuel represents a very large portion of the total operating expense of central stations demand that every possible method of increasing the efficiency of energy utilization be tried. Prevention of heat radiation from boiler and engine room equipment is one such means. In an early issue the magnitude of heat losses due to radiation from pipes, fittings, etc., the characteristics required in heat insulation, the thickness necessary for modern power-plant pressures and superheats, and the value of insulation as an investment, will be discussed. Bearing on the general problem occasioned by slow deliveries of equipment and the consequent difficulty of meeting

The Coming Issues

service demands, two articles will shortly be presented—one pointing out how larger outputs can be obtained from generators already installed by precooling the air, the other dwelling on how installations of self-cooled transformers can be made to carry larger loads through simple changes that permit circulating the oil. Data are given in each case to show the effectiveness of these methods. For engineers who hesitate about using formulas involving hyperbolic functions in making transmission-line calculations an early issue will reproduce charts which permit obtaining all the line constants graphically so that complex calculations are avoided and the effect of different conditions on their constants can be easily studied.

Coal Supply Made Sure by Buying Mines

Forehanded Policy by Which Commonwealth Edison Company of Chicago Made Large Purchases of Coal Mines and Land to Protect Its Supply of Fuel and Safeguard Against Ever-Increasing Cost

This article gives the reasons why the Commonwealth Edison Company of Chicago began fourteen years ago to buy coal mines and lands. The costly experiences of the last year have led a number of other central-station properties to purchase, or to inquire into the advisability of purchasing, similar properties.

ADEQUATE coal supply at reasonable cost is the keystone of successful operation by electric utilities with steam generating plants; without it these properties cannot profitably furnish service. The companies may have capital investment whittled to a minimum, with fair rates, economical operating methods and happy public relations, but unless they have in addition an assured steady supply of fuel at a price which they can afford to pay they face serious fetters upon their economic welfare.

LESSONS OF TWO WINTERS

The last two winters brought dismay to many central-station companies relying upon steam-generated energy for their service to their communities. They were not fully prepared for revolutionary changes in the coal industry. Trying to follow the established policy of buying coal as cheaply as they could and maintaining as good a reserve as possible against exigencies, the great bulk of the companies got caught in 1916-1917 in the war-time vise of short supply, runaway demand and sky-rocketing prices. To keep generating plants going they paid exorbitant figures for fuel. They invoked the favor of coal producers and suppliers, the efficiency of transportation agencies, the power of city authorities. And they came through the winter of 1916-1917 without general service interruptions, though the margin in many cases was a very tender one. The record of the winter of 1917-1918 was less satisfactory.

Distressing experiences carry a twofold lesson which, notwithstanding all other trials and problems of the times, is impressed deeply upon the executives and managers of central-station properties:

First, the stirring necessity of providing amply in advance for the coal requirements of the winter.

Second, looking ahead to future years when the scrambling will be over and coal conditions are again more normal, it is realized that in all probability permanent changes in coal cost will have to be faced.

With the two aspects of this situation the ELECTRICAL WORLD has dealt in frequent articles and editorials during the last year; the longer outlook is presented in this article, describing methods adopted by certain companies which not only strengthen and protect their present position but farsightedly safeguard their coal supply for the future.

The first large electric utility to take positive steps to assure its future coal supply at reasonable cost through the purchase of coal-producing properties was the Commonwealth Edison Company, Chicago. Its action in so doing is the more conspicuous because it is

not a policy brought about by recent serious developments; it was conceived and inaugurated, after a careful survey of conditions and the outlook for the future, as early as 1904.

It was on the personal initiative of Samuel Insull the president, that the Commonwealth Edison Company began to purchase coal lands about thirteen years ago. Mr. Insull decided to follow this policy as a result of study of several considerations. One of these was that the entire coal business was then in a state of demoralization. This demoralization lasted for a number of years following the initial purchases of coal lands to protect the supply of the Commonwealth company, but Mr. Insull felt confident that it would not continue permanently. At the time when the foundation policy was laid down, much coal was being sold in Chicago at less than the fair cost of production. It was believed that continued operation of the central-station company at a cost which included fuel at less than the fair cost of production was a dangerous basis for a public utility. Under these conditions the company would be selling its product of energy at unjustifiably low rates. It was reasoned that at some future time the coal industry would reach a more stable basis and that thereafter coal would be permanently higher. Any company selling energy at abnormally low rates because it was benefiting by demoralization in the industry from which it obtained a large part of its raw materials would have to confront, when the demoralization was overcome, the necessity of increasing rates to consumers.

Another consideration which influenced Mr. Insull to take action was that Illinois coal lands, as compared with similar property in other sections of the country, were cheap. Some of the early purchases, for instance, were made at prices as low as \$15 an acre. Besides being an operating safeguard, it was confidently believed that the purchase of coal lands would therefore be an excellent investment from a financial standpoint. This judgment has been borne out by the course of events. In 1913 and 1914 the lands had enhanced in value to about \$50 an acre, while at present, under the stimulus of the extraordinary war conditions, they are rated as worth \$75 an acre.

SAFEGUARDING THE FUTURE

In addition to these considerations was the vital one of raising safeguards for the coal supply for the future. Controlling enough lands to assure a source of supply without regard to what other producers did, the company could be more independent of general conditions in the coal market. As a matter of fact, it is estimated that the Commonwealth Edison Company owns enough coal lands to provide for its supply for a hundred years.

Following the same general policy, newer organizations under the direction of Mr. Insull and his associates—the Middle West Utilities Company and the Pub-

c Service Company of Northern Illinois—have also required interests in operating coal properties.

The main coal-land holdings of the Commonwealth Edison Company aggregate about 45,000 acres of land, after deduction of the acreage already mined. The nucleus of this large holding was acquired on April 1, 1904, by the Illinois Midland Coal Company, controlled by the Commonwealth interests and the Peabody Coal company. These companies had equal shares in the coal property. The Chicago & Illinois Midland Railroad was also acquired. This line is operated between Taylorville and Auburn, Ill., and connects with four roads reaching Chicago—the Illinois Central, the Chicago & Northwestern, the Chicago & Alton and the Wabash.

EXTENDING THE INVESTMENT IN COAL LANDS

Some years after the initial investment was made it seemed advisable to the Chicago company to purchase one-half of the coal lands owned by the Peabody Coal company, and this was done. By that time the coal lands had appreciated materially in value, but not to so great an extent as they have done under the later stress of war conditions. In connection with this transaction the Midland Counties Coal Company was formed to take over the properties.

The main holdings of the Midland Counties Coal company are at Kincaid, Christian County, Ill., and aggregate 40,000 acres. This company has also a mine at Pawnee, Sangamon County, Ill., and another at Sherman, near Springfield, the capital of Illinois. It has, in addition, 1300 acres of coal land in Vigo County, Ind., which have not been developed.

In the extension of the policy of buying coal lands on other Insull properties some mining lands were acquired on a co-operative plan. Last year the Midland Counties Coal Company (the Commonwealth subsidiary) and the Public Service Company of Northern Illinois acquired coal rights in 600 acres of land near Shelburne, Sullivan County, Ind. There was also bought for the Public Service Company 600 acres near Johnson City, Williamson County, Ill. In each of these purchases the Middle West Utilities Company bought an interest of 15 per cent. Ownership of the Indiana mine rests in the Indiana Hocking Coal Company. The mine in Williamson County, Ill., is owned by the subsidiary Muddy Fuel Company.

All of these mines are operated by the Peabody Coal company of Chicago. The contract covering the large Midland Counties properties is for a period of twenty-five years. The output of these mines at present is about 2,000,000 tons per year. It has been increased gradually to this figure. When first acquired only two mines were in operation on the property. In 1912 the work of opening No. 7 mine at Kincaid was started. This construction, which equipped the mine to hoist 4000 tons daily, was finished in 1913, and in that year the company began to sink another shaft. This mine, called No. 8, has also capacity to hoist 4000 tons daily. These two mines are among the most modern in equipment in the country.

As the two original mines had capacity to hoist 2200 tons each daily, the production is 12,400 tons every twenty-four hours. Electrical energy is used to a large extent in the entire operations. Preparations are being made to sink another mine of the same size as the last

two. This mine will be of modern type of construction.

Different arrangements have been worked out with the operating company, the Peabody Coal Company, so as to stimulate and safeguard the production desired by the central station. From the time the Midland property was bought until Dec. 15, 1913, the amount of coal produced was divided evenly between the Commonwealth company and the Peabody company. Then, under a new agreement, the Peabody company contracted to furnish 1,000,000 tons of coal per year to the Commonwealth company. On May 1, 1917, a supplemental contract was made whereby the Peabody company furnishes an additional 500,000 tons, making a total of 1,500,000 tons. As the requirements of the Commonwealth company for 1917 are 2,100,000 tons, it is necessary for that company to purchase in the outside market 600,000 tons. The Commonwealth company purposely takes less than its fuel requirements from its own mines, because it is able to buy screenings in the Chicago market at advantageous prices and thus to conserve its own supply longer.

Under the contract the Commonwealth subsidiary, the Midland Counties Coal Company, pays the Peabody company the cost of production plus reasonable charges on a per ton basis for administrative expenses, accident insurance, amortization of bonds and contingencies. Included in the cost of production are bond interest, labor, repairs and mining.

Supervision of the contractual relations between the Commonwealth subsidiary and the Peabody Coal Company is under the direction of the fuel agent of the Commonwealth company and the Public Service company, who also acts in an advisory capacity for the Middle West Utilities Company. Daily fuel statements, showing the cars en route, total supply, etc., are received. An inspector is at the mines all the time, and it is his business to check costs and make suggestions as to economical methods of mining, etc.

COST OF MINES STILL RELATIVELY LOW

The vice-president of the Commonwealth company, under whose jurisdiction the coal mining and purchasing interests of the company are placed, said to a representative of the ELECTRICAL WORLD in commenting on the fuel policies outlined above:

"Ownership of the coal mines assures us of a coal supply in the winter when other sources are overburdened with the general demand. During seasons when there is plenty of coal on the market we are frequently able to buy at low prices, and this reduces our average cost of coal and also protects our own supply. For instance, screenings are often offered in the market at a low price by operators who have sold their lump coal at such a good figure that they can well afford to take a low rate for screenings, for the average obtained in this way is ample compensation.

"The policy of Mr. Insull in planning ahead for years to protect our sources of coal supply has been amply justified by the events of the last twelve months. I should not hesitate to advise other companies to purchase coal lands in order to strengthen their future position regarding the serious problem of coal supply. Although prices of coal mines and land have risen rapidly, the investment cost is still relatively small, and the relief and financial advantages of a reserve supply are demonstrated forcefully by present conditions."

Flexible and Accurate Method for Dielectric Tests

Description of a Series-Inductance Bridge for Measuring Dielectric Energy Losses at Low Frequencies and High Potential Gradients—Method of Using the Apparatus

BY CHESTER ARTHUR BUTMAN

At the present time there is a notable lack of data on the dielectric constants which pertain to a large variety of substances. This bridge affords a means of obtaining the information. As alternating currents are used, no trouble is caused by the dielectric after-effect, as is the case with direct currents. The bridge gives a means of determining the geometric capacity of condensers having a capacity from 1 mfd. to 0.0001 mfd., with one setting of the bridge arms, with an accuracy of about 0.01 per cent of the capacity measured.

The bridge is especially valuable in investigating anomalous dielectrics. The change of a dielectric to the state of a conductor can be traced by changing the temperature.

Moreover, it is now generally recognized that a measure of the dielectric energy loss is the best single test that can be applied to insulation. In designing electrical machinery it is now necessary to take into account, besides the other losses, the dielectric energy loss. This bridge gives a means of determining this loss under the same conditions that obtain in practice.

HAVING had to develop a method of measuring the dielectric losses in insulating materials at low frequencies (60 cycles) and high-potential gradients (31,500 volts per cm.), and believing that the method would be of interest to other investigators, the writer has undertaken, in the following paper, to give full directions for setting up and operating the apparatus used. The equipment consisted principally of a series-inductance bridge (Fig. 4).

While the advantages of this type of bridge had been recognized¹ for measuring small changes in the dielectric loss angle, it was thought that it lacked the flexibility necessary to measure large changes in the angle conveniently. The present series-inductance bridge, as developed by the writer, however, has been found to have such great flexibility that large or small dielectric loss angles can be measured easily. The chief changes made were the development of general formulas for the determination of the geometric capacity, the dielectric loss angle, the total current and the dielectric energy loss, the use of aluminum wire as the vibrator in the Einthoven galvanometer used and the method of grounding adopted.

MEANING OF SYMBOLS USED IN DEVELOPMENT OF FORMULAS

ϕ = phase angle of condensers involved. -

$\theta = 90^\circ - \phi$ = dielectric loss angle.

$\cos \phi = \sin \theta$ = power factor of dielectric.

$P = 2\pi f$ where f is the frequency of the alternating current.

C_x and C_s = geometric capacities of the condenser under test and standard comparison condenser respectively.

r_s = equivalent resistance which would give the same phase-angle displacement ϕ_s when used with a perfect geometric capacity having the same value as C_s as would be actually obtained by C_s .

r_x = equivalent resistance corresponding to C_x .

L_1 = inductance in bridge-arm 1.

L_2 = inductance in bridge-arm 2.

R_1 = non-inductive resistance in bridge-arm 1.

R_2 = non-inductive resistance in bridge-arm 2.

$a_s = r_s - (j/PC_s)$ = impedance in bridge-arm.

$a_2 = R_2 + jPL_2$ = impedance in bridge-arm.

$a_x = r_x - (j/PC_x)$ = impedance in bridge-arm.

$a_1 = R_1 + jPL_1$ = impedance in bridge-arm.

Capacity Equation.—The geometric capacity is the same whether measured by alternating current or direct current and may be obtained from the relation showing the condition of balance for the bridge.—Lord Raleigh² and others have shown that the condition for balance in such a bridge is

$$a_s a_2 - a_x a_1 = 0, \quad (1)$$

or, substituting the values of a_s , a_2 , a_x and a_1 , multiplying, collecting real and imaginary terms:

Real terms—

$$R_2 r_s + (L_2/C_s) - R_1 r_x - (L_1/C_x) = 0 \quad (2)$$

Imaginary terms—

$$(-jR_2/PC_s) + jPL_2 r_s - jPL_1 r_x + (R_1 j/PC_x) = 0 \quad (3)$$

From the diagram (Fig. 1) it may be seen that $r \div 1/PC = \tan \theta = Pcr$, whence from (2)

$$\frac{\tan \theta_s R_2 + PL_2}{\tan \theta_x R_1 + PL_1} = \frac{C_s}{C_x} \quad (4)$$

Equation (4) may be used to determine the geometric capacity of C_x if the geometric capacity of C_s is known. However, for most purposes the capacity equation derived similarly from (4) will be found most convenient:

$$C_x = C_s \frac{R_1 \div PL_1 \tan \theta_x}{R_2 - PL_2 \tan \theta_s} \quad (5)$$

Equation (5) is the equation which has been used in all the subsequent calculations for capacity. If the condensers C_x and C_s are perfect, there will be no dielectric loss angle. Consequently $\tan \theta = 0$, so that the correction term $PL \tan \theta$ will vanish and

$$\frac{C_x}{C_s} = \frac{R_1}{R_2}.$$

Hence, the measurement of the capacity is primarily based on the measurement of the resistances R_1 and R_2 . In any case the correction term to be applied is small, although in most cases it is necessary to use the full formula in order to obtain the correct value of the geometric capacity.

It is important to notice that this formula gives the geometric capacity at any frequency and with any dielectric loss angle. Hence the geometric capacity can be determined for a given condition of the condenser by balancing the bridge only once.

Formula for the Dielectric Constant.—The dielectric constant or specific inductive capacity (S. I. C.) for two parallel plates is given by the equation,

$$\text{S. I. C.} = 4\pi DC_x/S \quad (6)$$

where D is the distance between the plates in centimeters and S is the area in square centimeters of one of the plates. Using equation (5) and substituting in (6)

¹First proposed by Dr. Rosa and developed for measuring small dielectric loss angles at low voltages, but not for dielectric energy loss, by F. W. Grover. (Bulletin of the Bureau of Standards, Vol. 3, 1907.)

²Proceedings Royal Society, Vol. 49, p. 203, 1885.

$$S. I. C. = \frac{4\pi DC_s(R_1 - PL_1 \tan \theta_s)}{S(R_2 - PL_2 \tan \theta_s)} \quad (7)$$

Dielectric Loss-Angle Equation.—Using equations (4) and (5) and equating equals,

$$\frac{\tan \theta_s R_2 + PL_2}{\tan \theta_s R_1 + PL_1} = \frac{R_2 - PL_2 \tan \theta_s}{R_1 - PL_1 \tan \theta_s}$$

Multiplying out

$$\frac{\tan \theta_s - \tan \theta_x}{1 + \tan \theta_s \tan \theta_x} = \frac{PL_1 R_2 - PL_2 R_1}{R_1 R_2 + P^2 L_1 L_2}$$

Substituting trigonometric equivalents,

$$\tan(\theta_s - \theta_x) = \frac{P(L_1 R_2 - L_2 R_1)}{R_1 R_2 + P^2 L_1 L_2} \quad (8)$$

Or multiplying the equation before (8) by (—1)

$$\tan(\theta_x - \theta_s) = \frac{P(R_1 L_2 - R_2 L_1)}{R_1 R_2 + P^2 L_1 L_2} \quad (9)$$

FIGS. 1, 2 AND 3—RELATION BETWEEN E , I , $1/PC$ AND PHASE AND DIELECTRIC LOSS ANGLES; SERIES-INDUCTANCE BRIDGE FOR MAKING DIELECTRIC TESTS; FRAME FOR HOLDING SAMPLES

The dielectric samples (45.72 by 45.72 cm.) were held in place by two pieces of special dried, oil-soaked maple, the same size as the samples. These wooden pieces were made of several layers of wood to prevent warping and of sufficient thickness to prevent bending. In the center of the wooden pieces a square copper sheet (30.48 by 30.48 cm.) was placed flush with the surface of the wood. The copper plates were held in place by screws, the ends of which were attached to a wire serving as an electrical connection. The lower fixed plate was used as the low-potential plate and was supported by a post of treated maple, so that the two

plates were highly insulated from one another. No iron was used in any part of the frame.

The upper plate was supported by a brass micrometer screw arrangement. The end of the screw was attached to a metallic piece which allowed the screw to turn but which fitted so tight that there was no play. There was no back-lash in the screw. Two wooden rods attached to the upper wooden piece prevented the upper plate from moving out of position while it was being moved up or down. Hence the copper plates were always lined up in the same way.

If the dielectric loss angle of the dielectric under test is greater than that of the standard condenser, equation (9) is used; if it is less, it will be found necessary to use (8). Using equation (9),

Let $\tan(\theta_x - \theta_s) = \tan A$

then $\theta_x = \theta_s + A$

$$\text{whence } \theta_x = \theta_s + \tan^{-1} \frac{P(R_1 L_2 - R_2 L_1)}{R_1 R_2 + P^2 L_1 L_2} \quad (10)$$

It will be noted that the measurement of the dielectric loss angle is independent of the measurement of the capacity. On the other hand, the capacity is dependent on the accurate measurement of the dielectric loss angle.

Formula for the Current.—In developing the bridge formula it has been assumed that a condenser with a perfect dielectric and capacity c is placed in series with an equivalent resistance r . The current through a perfect condenser in series with a resistance is given by the equation

$$I_x = \sqrt{\left(\frac{1}{PC_x}\right)^2 + r_x^2} E_x$$

where E_x is the effective voltage applied to the condenser. From the diagram (Fig. 2) it is seen that $r_x = \frac{\tan \theta_x}{PC_x}$, whence, substituting and simplifying,

$$I_x = E_x PC_x \cos \theta_x \quad (11)$$

Formula for the Energy Loss.—

$$\begin{aligned} \text{Ergs per second} &= I_x E_x \sin \theta_x \times 10^7 \\ &= E_x^2 PC_x \cos \theta_x \sin \theta_x \times 10^7 \end{aligned} \quad (12)$$

An examination of the energy loss formula shows that, at constant frequency, if θ_x and C_x do not change with the strength of field, the energy loss will be directly proportional to the square of the applied potential. Experiments which have so far been made on the change of the capacity with the applied potential show for the most part that there is no change. In any case the change is an extremely small one, so that C_x may be regarded as a constant when measured at different potentials. Therefore, whether or not the energy loss is proportional to E_x^2 depends on whether θ changes with the applied potential.

The experiments which follow show conclusively that

in some cases θ increases and in others decreases as the applied potential is increased. Hence the energy loss is usually not proportional to the square of the applied potential, but may increase faster or slower than E_x^2 as E increases. The governing factor is the product $\cos \theta_x \sin \theta_x$. This product is equal to zero when $\theta_x = 90$ deg., hence there is no energy loss when the condenser has a perfect dielectric. If $\theta_x = 0$ there is also no energy loss, in which case the condenser is a perfect conductor, having no resistance. In this last case the capacity would be infinite and consequently the dielectric constant would also be infinite. The product $(\cos \theta_x \sin \theta_x)$ is a maximum when $\theta_x = 45$ deg. Hence, if a substance has a dielectric angle of loss less than 45 deg. it is primarily a dielectric. On the other hand, if θ is greater than 45 deg. the substance is primarily a conductor. Hence, it will be seen that a new and exact definition of a dielectric and a conductor can be given, viz., a dielectric is a substance whose dielectric loss angle is less than 45 deg. A conductor is a substance whose dielectric loss angle is greater than 45 deg.

From the foregoing considerations it will also be seen that if θ increases the substance is becoming more like a conductor. On the other hand, if θ decreases the substance is becoming a more perfect dielectric. Hence, the dielectric loss angle gives the degree of imperfection of the dielectric.

Features of Apparatus Employed.—The standard condenser C_s is a very important part of the apparatus, because the determination of the absolute value of the dielectric loss angle and the geometric capacity of the condenser under test depend upon it. The standard air condenser used consisted of fifty sheet-iron plates with an air space of 2.54 cm. between them. The flash-over voltage was 15,000 volts. The plates were inclosed in an air-tight box which was kept free from moisture by phosphorous pentoxide.

When the condenser was first constructed it was supposed it would have no dielectric loss angle. However, it was found on testing it that on account of the insulation used between the plates it had a small dielectric loss angle. The dielectric loss angle was determined by comparing C_s with two aluminum plates 72 cm. in diameter suspended in air at a distance apart of about 4.5 cm. The upper plate was connected to the high-potential side of the transformer and the lower plate was placed on three large porcelain insulators. The aluminum plates were therefore substituted in place of C_x .

It will be observed that, provided a spark does not pass between the plates, the distance apart is not important as the dielectric loss-angle measurement is independent of the capacity. Under these conditions it was found that the absolute value of the dielectric loss angle of the standard condenser was 0 deg. 54 min. 25 sec. \pm 20 sec. The testing voltages applied were from 1500 volts to 4000 volts inclusive. Numerous independent check tests have made it certain that the value obtained is correct. The corresponding power factor $\sin \theta_s = 0.01583$.

Effect of Applied Potential on Dielectric Loss Angle.—It is important to know whether the dielectric loss angle of the standard condenser changes with the applied potential. This point was tested by placing the testing frame (see Fig. 3) in the bridge arm as C_x . The plates of the frame were widely separated and the bridge was balanced at 2000 volts. Then the voltage was raised in steps to 10,000 volts, no change being found necessary from that obtained at 2000 volts. This proved conclusively that there was no change in the dielectric loss angle of the standard condenser due to a change in voltage.

The dielectric loss angle of the standard condenser was constant over a long period of time, as was shown by check tests made on a standard sample of micarta from time to time.

Capacity of the Standard Condenser.—The capacity of the standard condenser was obtained by comparing its capacity with a standard mica Leeds & Northrup condenser, with a Westinghouse condenser terminal of known value, and a section of a cable that had been tested in another laboratory. The value of the capacity of all the plates of C_s in parallel was found to be 0.012000 microfarad.

The value of the capacity was found not to change

with a change in the applied potential, or to change over a long period of time, the tests being similar to those made for the constancy of the dielectric loss angle.

Testing Frame.—A special testing frame was designed by the author in order that the dielectric constant could be determined with accuracy at the same time the other measurements were made. It is important that the distance between the plates be accurately known and that it does not change because of the stress produced by the potential. This frame also serves to hold the dielectric under test in a convenient manner and does away with the necessity of attaching condenser plates by means of shellac, etc., to the samples of dielectric under test. The frame also provides a means whereby a liquid can be tested so that nothing but the dielectric under test is between the condenser plates (Fig. 3).

The frame had no leakage, as was shown by the test of the standard condenser already mentioned. The matter of edge correction is of no importance as the correction is so small it can be neglected.³ When the distance between the plates $D = 0.3175$ cm., then the S.I.C. = 3865.2 C_x .

Corona Effect Avoided by Immersion in Oil.—As it was impossible to test dielectrics at high voltages in air on account of the corona effect, it was necessary to test them under oil. The oil used had a paraffine base and was free from moisture. The tank was a large transformer case which was surrounded on the outside by several layers of fullerboard to prevent radiation. It took three days for the tank of oil to cool from 100 deg. C. to room temperature. The heating of the oil in the tank was regulated by large electric grid heaters placed in the bottom of the tank in contact with the oil. The current through the heaters was controlled by an auto-transformer.

Source of Potential.—The source of potential was a 60-cycle alternating-current generator, giving a sine wave as shown by the oscillograph. The voltage and frequency were constant with the accuracy usually obtained in practice. The frequency was obtained from a frequency meter, and the potential across the condenser terminals was obtained (when required) by an auxiliary measuring transformer not shown in the diagram. The value of the potential was adjusted by means of a Westinghouse 10-kw. variable-ratio testing transformer, the primary of which was connected to the source of the potential. The transformer had a range from zero to 10,000 volts in 200-volt steps, or zero to 5000 volts in 100-volt steps. One side of the secondary was grounded, and the other side leading to the bridge had a fuse in it to break the current in case the condenser under test broke down.

The Resistances.—The resistances used were of the Leeds & Northrup non-inductive dial type. The resistance in one arm had a range from zero to 100 ohms in 0.1-ohm steps. The resistance in the other arm had a range from zero to 8000 ohms in 10-ohm steps. It should be noted that the resistance of the inductance in each arm must be added to that of the variable resistance. The resistance of the bridge wires was neglected as they were 0.2032 cm. in diameter. All joints in the bridge were soldered.

The Inductances.—The standard fixed inductance

FIG. 4—TESTING ARRANGEMENTS

³J. A. Pollock and O. U. Vonwiller. *Phil. Mag.*, Vol. 3, p. 589, 1902.

was made by Leeds & Northrup and had a range from zero to 100 millihenries in 2.5-millihenry steps. The variable inductance was of the Ayrton-Perry type and was made by Leeds & Northrup. It had a range of 6 to 43 millihenries, being graduated in millihenries so that tenths of a millihenry could be estimated accurately.

Vibration Galvanometer.—The Einthoven vibration galvanometer used was made by the Cambridge Scientific Instrument Company, England. It is essentially a light current-carrying wire placed in a strong electromagnetic field. An increase in the current causes the wire to be deflected by the mutual electromagnetic repulsion. A notable improvement in the usual method of using it was made by placing the vibrator directly in the circuit as shown in the diagram. The galvanometer frame is usually grounded, but in this case the frame was removed as far from ground as possible. This was done by placing sufficient insulation between it and the pier on which it was placed. The pier was free from vibration. The change in the method of grounding also made it necessary to reconstruct the case which holds the vibrator so that the case would be insulated from the vibrator. Thus the vibrator was insulated from the frame.

By using this method the use of an auxiliary bridge for balancing the capacity of the main bridge to ground, as used by K. W. Wagner and others, was avoided. With this method it was also found unnecessary to use a substitution method in measuring the capacity as described by F. W. Grover.⁴

The vibrator was illuminated by an incandescent lamp and its shadow was allowed to fall on a ground glass screen 114.3 cm. distant. The screen was inclosed in a box from which all stray light was excluded while being observed. By focusing, the edges of the shadow of the vibrator could be sharply defined so that a slight vibration could be readily detected by noticing the relative blackness of the edges as compared with the central portion. The galvanometer is used simply as a detector as to when the bridge is balanced. When the bridge is balanced the vibrator has no motion. A short-circuiting switch protected the galvanometer during adjustment.

No trouble was experienced in tuning, and the vibrator usually remained in adjustment during a series of readings. The adjustment was facilitated by a belt-like arrangement which ran from the tuning device on the galvanometer to a roller above the ground-glass screen.

When the galvanometer was first used it had a silver vibrator. This vibrator was very sensitive to a change in resistance, but was comparatively insensitive to small changes in the inductance. On account of the sensitiveness of the bridge to changes in the resistances which cause a relatively large change in the current, it is possible to obtain an approximate value of the capacity when it is impossible to make an accurate measurement of the dielectric loss angle. This is illustrated by the fact that with all of the substances examined at room temperature it was found impossible to use a potential gradient less than 3150 volts per centimeter and obtain the dielectric loss angle with accuracy. However, the galvanometer was still sensitive to small changes in resistance so that capacity could

be determined to a degree approximating exactness.

The two factors which determine the sensitiveness of a vibrator are its conductivity and its mass. A metal which has a high conductivity for its mass is aluminum. A wire of this material 0.0762 cm. in diameter when used as a vibrator was found to increase greatly the sensitiveness of the galvanometer to small changes in inductance. It is essential that small changes of inductance be detected in order that the dielectric loss angle and the dielectric energy loss be determined accurately. The choice of a vibrator is a very important one when 60 cycles is used because the galvanometer becomes more insensitive the lower the frequency becomes.

General Considerations.—The bridge wires and the various portions of it were arranged in a symmetrical manner. In this way the capacity relative to ground of the different arms of the bridge was symmetrically distributed. Since it is important that the capacity to ground be reduced to the least possible amount, the bridge wires, for the most part, were placed high in the air. There was no mutual induction of an appreciable amount between the different units of the bridge. Strong, steady electrostatic and electromagnetic fields caused no difficulty in operating the bridge.

Since results can be compared only when they are obtained at the same potential gradient as well as the same temperature and frequency, it is necessary to know the distance between the plates in order to determine the exact potential gradient as well as the specific inductive capacity. The two factors which determine the potential gradient are the applied potential and the thickness of the material. As these can both be varied, a wide range of gradients is available with the maximum applied potential of 10,000 volts. The practical limits are, on the one hand, the insensitiveness of the bridge to a change in inductance with a gradient less than 3150 volts per centimeter, and, on the other, the breakdown strength of the material.

Manipulation of the Bridge.—The bridge is adjusted best by first finding an approximate adjustment of R_1 and R_2 , then of L_1 and L_2 , then make a final adjustment of the finer resistance, then make a final adjustment of the variable inductance. If the bridge is working properly, a change of 0.1 ohm greater or less in the resistance, or of 0.1 millihenry greater or less in the inductance, should cause a change in the balance of the bridge.

The bridge is best manipulated when R_1 is about equal to R_2 . This is secured by making the capacity of C_s about the same as that of the condenser under test. However, the bridge has been found to be accurate when the ratio of the resistances was sixty to one. The amount of resistance to be used is dependent on the number of significant figures required in the capacity calculations, and on the amount of current flowing through the bridge. The more current flowing in the bridge the more sensitive is the galvanometer. However, care must be taken that the current is not too great, otherwise the vibrator will burn out. The greatest current passing through a condenser under test at any time was 0.36125 amp. and the smallest was 0.000371 amp.

The resistances and inductances can be chosen so that, however small the difference between $R_1 L_2$ and

⁴Bulletin, Bureau of Standards, Vol. 3, p. 392, 1907.

⁵Einthoven, *Ann. der Phys.*, Vol. 1, pp. 483, 665, 1906.

R/L , becomes, it can always be made the difference between two *large* quantities. In this fact lies the great advantage of the series inductance method for the measurement of small differences in the dielectric loss angle.

If the dielectric loss angles are large (for instance 35 deg.), it is sometimes convenient to use the bridge with $L_1 = 0$. In this case $\tan(\theta_r - \theta_s) = PL_2/R_2$ and the calculations are much simplified. However, this is not a convenient formula to use for small dielectric loss angles (such as 14 deg.) because it is difficult, practically, to make L_2 sufficiently small, or R_2 suffi-

ciently large. Hence it will be seen that this method has great flexibility and is capable of universal application in this field of work.

There is always the possibility that the condenser under test will break down. In this case the operator is protected somewhat by the insulated platform. The circuit has a fuse and breaker in it which also affords some protection.

The experimental part of this paper was done at the high-tension research laboratory of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., of which C. E. Skinner is director.

Selection of Motors for Shipbuilding Plant

Conditions Influencing Individual Drive and Determination of Proper Rating, and Some Characteristics That Have Been Found Requisite in Motors for Plate-Shop Machines

BY DAVID ELWELL

Electrical Engineer Lockwood, Greene & Company

ONE of the largest and most complete hull, engine and boiler plants along the Atlantic coast for the construction of steel vessels is being rapidly completed for the Staten Island Shipbuilding Company at Mariners' Harbor, New York City. The yard is built on the site of an old plant formerly used by the company for the construction of wooden vessels and equipped with a 220-volt direct-current power plant.

The first of the buildings in the new development to be completed was the plate shop, in which the steel for plating the hulls is prepared. Since it was necessary to put this shop in service as soon as the building was up, and as the question of electric power supply for the whole plant had not been worked out at that time, the direct-current energy then available was used. The machine tools listed in the accompanying table were installed and equipped with individual motors, in most cases belted directly to the machines.

CONDITIONS INFLUENCING INDIVIDUAL DRIVE

Every consideration involved in connection with the plate-shop machines led to individual drives. Neither the type of building, the arrangement of machines nor the operating conditions surrounding the use of them makes group drives desirable.

The building is a high studded steel-frame building with peak roof and two longitudinal bays, with a traveling crane in one of them. Under these circumstances the shafting necessary for group drives would be cumbersome and expensive. Furthermore, in order to secure sufficient space around the machines for handling the large plates and angles that are being fabricated considerable clearance had to be left between machines. This would further add to the expense of providing group drive.

The other controlling factor is the fact that while the final product of the yard may be standardized (*i. e.*, a number of identical vessels) on a given contract, each machine tool is used for several operations. The work on any given machine is, therefore, very much of a "jobbing" proposition, and the use of any machine is required for long or short periods at indefinite intervals.

To give the greatest flexibility of service, maximum utility and the lowest power cost for the output involved individual motor drive was therefore chosen without question.

The arrangement of tools in the plate shop and routing of materials to and from other buildings is shown

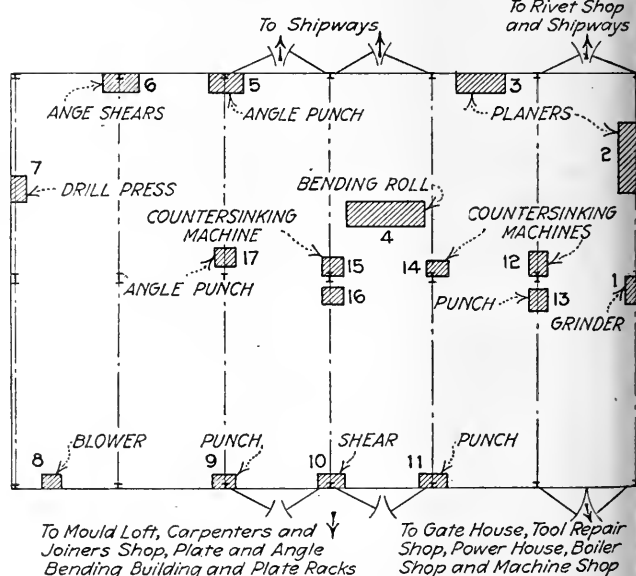

FIG. 1—LAYOUT OF MACHINES IN PLATE SHOP

in the accompanying diagram. The demand for immediate operation was so pressing that no opportunity was offered for any testing, and the motor sizes were chosen with the idea of not having them too small even if they were too large.

Soon after the building had been successfully put into service the question of permanent electric power supply for the plant was taken up, the old direct-current plant being entirely inadequate for the requirements of the new yard and occupying a site needed for other buildings. As pointed out in the Jan. 5 issue of the *ELECTRICAL WORLD*, a careful analysis of all power requirements led to a contract for alternating-current ser-

vice being entered into with the Richmond Light & Railroad Company.

The necessity of changing the motor drives from direct current to alternating current for operation on the purchased-power lines therefore afforded the opportunity for determining the actual duty cycle of work on the machines and the proper alternating-current motor to install. Ammeter and voltmeter readings were taken on the individual direct-current motors on each of the drives, with the results which are given in Table I.

DETERMINATION OF PROPER RATING

Considering the test data on the direct-current motors, item 1 is the conventional grindstone and emery wheel used for sharpening the shop tools. The motor drives a small counter-shaft from which both grinding

tool is held on a carriage which travels parallel to the edge of the plate on a long screw. The tests showed that both the plate planers were considerably overmotored as then equipped and that 10-hp. and 15-hp. motors for items 2 and 3 respectively would be found to be ample.

The bending rolls (item 4) are for bending plate cold into circular shape, the relative location of the rolls being adjusted manually to increase the curvature as the plate is passed back and forth through the rolls. The motor is belt-connected with a counter-shaft from which open and crossed belts operated by a shifter drive the rolls in either direction. While the rolls were equipped with a 30-hp. motor, the tests indicated that a 25-hp. motor was proper for this drive.

Instead of a 10-hp. motor on the drill press and blower (items 7 and 8), 3-hp. and 5-hp. motors respectively

ENCLOSURE OF GEARS AND FLYWHEELS AND ELEVATED POSITION OF MOTORS TYPICAL OF STATEN ISLAND SHIPBUILDING COMPANY'S PLATE SHOP

flywheel and gears are inclosed and the motor elevated. D—Plate-bending machine No. 4; the metal inclosure at the right serves as a control house and also to protect the workmen from the gears and to house the motor.

wheels are belted. This group was found to be considerably overmotored, a 2-hp. motor proving sufficient for the load.

The plate planers (items 2 and 3) have long beds, on which the plates whose edges are to be planed are placed, the plate being held firmly by adjustable jack screws on the upper frame of the machine. The cutting

were found of ample size. On the countersinks (items 12, 14 and 15) a 5-hp. motor for No. 12 and 3 hp. each for the other two were found to be suitable.

No unusual starting conditions existed in connection with the foregoing drives. On some of them the motor is started light and the load applied by shifting the belt, and on others the tool starts directly with the

motor; but as there is little inertia to overcome on account of the absence of flywheels, etc., standard squirrel-cage motors were used.

The most interesting motor applications are the punch and shear installations (items 5, 6, 9, 10, 11, 13, 16 and 17). They are low-speed machines and ones in which the working interval is very short, being simply the

*F—These machines provided with fly-wheels.

stroke during which the tool is punching or shearing. At that moment, however, the instantaneous power requirement is very heavy. Rather than use a motor big enough to carry the tool through its working stroke, the machine-tool designers adopted the wise expedient of using a heavy flywheel, which stores up energy when the machine is running light and delivers it as the machine slows down on the cutting stroke.

The presence of the flywheel permits a much smaller motor than would otherwise be required, but proper acceleration of the machine presents quite a problem. The severe starting conditions which resulted are indicated by the accompanying test data.

SOME FACTORS THAT AFFECT SELECTION

Three important points which have to be recognized in the selection of a motor are the power required to

start the machines, that required to run them, and the maximum horsepower necessary which the motor can develop at starting without throwing off the motor belt.

The tests indicated that 9 hp. to 12 hp. was necessary to start the punching and shearing machines. Since a standard squirrel-cage motor of about the sizes required would only develop a starting torque equivalent to one to one and a half times full-load torque, it is evident that a motor of proper size to handle running conditions would stand no chance of starting these machines under the conditions shown to exist. If the driving belt happened to be too loose, the motor pulley might slip and throw it off, but it could not develop sufficient torque to meet the starting requirements indicated by the test. If a starting compensator were used, it would lower the starting torque still further by reducing the applied voltage. For these reasons it was impossible to use a standard squirrel-cage motor either with or without starting compensator.

The proper drive for punching or shearing machines is therefore one which gives a powerful yet gradual starting characteristic. This may be secured from an alternating-current motor with slip rings and external starting device or from a squirrel-cage motor with high-resistance end rings. From the standpoint of simplicity, price and quick delivery, the high-resistance end-ring type was considered preferable, as a number of manufacturers carry a stock for elevator service.

When this type of motor is thrown directly on the

line the high resistance in the rotor end rings causes considerable slip at starting, allowing the motor to accelerate powerfully and yet gradually. Another advantage of the high-resistance type is its falling speed characteristic with increasing load, which results in an increasing torque and helps the flywheel over the peak of the load. The speed-torque characteristics of this motor are very similar to that of the series direct-current motor used for traction purposes, and they fit it admirably for this work. The greater complexity of the slip-ring motor and its susceptibility to trouble

from dirt and grit in machine shops were other factors which affected the selection of high-resistance end-ring squirrel-cage motors for the punching and shearing machines.

The only compensators in the shop are used on items 3 and 4. These were necessary, as the motors are rated in excess of 10 hp., the compensator being used to limit the inrush of current at starting.

On the other motors, because of their small size, no compensators are necessary to limit the starting current, while on the high-resistance end-ring motors no compensator is permissible, as full line-voltage is necessary on these motors to give the proper starting torque.

A motor voltage of 220 was chosen for the plant to secure maximum safety for the operatives. With this

low voltage it was not necessary to use oil circuit breakers for starting the motors, so safety inclosed fused knife switches were chosen. The switch is opened or closed by a handle outside and offers complete safety for the operative.

To take the large starting current of the squirrel-cage motors it was necessary to fuse their switches so heavily that no protection is afforded to the motor at moderate overload. In case of grounds or dead short circuit in the motor, however, the fuses would cut it off. With individual motors on machines which are always under the eye of the operative there is little chance for overload on the motor which the operative will not know about. The plant was designed and equipped under the supervision of Lockwood, Greene & Company, Boston and New York.

Utilization of Second-Hand Line Materials

Some Material of This Description Can Be Renovated and Utilized
for Service Which Is Not So Exacting as the Use
for Which It Was Originally Intended

BY L. M. KLAUBER

Superintendent Electric Department San Diego Consolidated Gas & Electric Company

NEVER before has there been such a need for increased economy of operation and for more efficient utilization of labor and material. Of course, economy must not be allowed to interfere with maintaining a high standard of service; but, in attempting to decrease expenses by the standardization of equipment and the adoption of more efficient or durable apparatus, sight should not be lost of the economy of utilizing discarded material and equipment. Here is where the construction department, which acts in the capacity of contractor to the operating department, has an opportunity to determine how this so-called scrap material can be utilized to best advantage.

With the increased cost of all raw materials, a careful study of scrap, that is, material which can be disposed of only as junk, should be instituted by all central stations. Metals, alloys, scrap rubber, etc., should be carefully segregated as to quality, so that the highest price may be obtained for each. The degree of segregation which should be practiced will depend upon the specific conditions in each case, the quantity of each class of scrap accumulated, and proximity to raw material markets. Disposal direct to junk dealers will save much trouble, but in any case a certain segregation is advisable. A miscellaneous scrap heap is the junk man's picnic; he pays a skim-milk price, based on the least valued metal in the pile, and then separates the cream in the privacy of the junk yard. Other material and equipment can be renovated and used for a new service which is not so exacting.

METHODS OF UTILIZING OLD POLES

Poles form the greatest bulk of distribution plant removed. Poles of adequate length and size can be retreated and used again, if not too badly deteriorated; others may be too light or too worn. It becomes necessary, therefore, to segregate returned poles into three

general groups—those which may be reissued as poles for standard work, those too light or short for such work, and those no longer of any value as poles.

Retired poles which are deemed adequate to re-use as such by a power company must first be carefully examined for soundness. The butt can usually be sawed off about 6 in. (15.2 cm.) above the old ground line if weakened by decay. In fact, it usually pays to discard the butt if decay has advanced beyond a surface sap rot. Sometimes about 3 ft. (0.9 m.) of the butt can be removed so that when the pole is reset the deteriorated portion falls so far below the surface that it will not be subject to rot. In any case the pole should be carefully treated to arrest further decay, otherwise the life after reinstallation will be short. Brush treatment is better than nothing, but an open-tank treatment is much to be preferred.

In these days of greater strength of construction and wider clearances, the 30-ft. (9.1-m.) poles with 5-in. (12.7-cm.) tops, commonly referred to by linemen as "toothpicks," have little place. In a rapidly growing community they accumulate in considerable quantities. Installation on rural branch lines often solves the problem of their disposal. In some locations villa lots are so large that a special-service pole is required between the main lead and each house. An old 30-ft. or 25-ft. (9.1-m. or 7.6-m.) pole serves well for this purpose. Short poles can sometimes be used in rolling country on long-span work, where necessary clearances can be secured by taking advantage of the hilltops. A short pole as a push brace will often solve a difficult problem where anchor rights cannot be obtained. One avenue of disposal of light poles which must not be overlooked is to communication companies. Telephone and telegraph construction, especially in rural districts, is ordinarily of lighter quality than that of supply lines, and often a lot of light second-hand poles in sound con-

dition can be disposed of to such companies at a price well above scrap value.

If a pole is no longer fit to use as such, the next best service to which it can be put is as a guy stub. Ordinarily a guy is a poor location for second-hand material, since failure is expensive and care must be taken not to employ stubs that are too light. If insuf-

FIG. 1—WOOD THIMBLES ON PINS REPLACED WITH LEAD THIMBLES CAST IN HOME-MADE MOLDS

ficient for use as stubs, poles may be cut up as anchor slugs or for crib-bracing unguyed poles under strain. Light pieces may be sold to farmers for fence posts. Poles are useful in all heavy construction work and can be disposed of to contractors, house movers and the like. Square redwood poles were once used considerably in some parts of the country before the price became prohibitive. They may be sawed up and put to a variety of uses, particularly in rough building work. They are also valuable in the construction of mudsills, bog shoes or crowfeet for holding poles in marshy ground, owing to the durability of redwood in the presence of moisture. A piece of redwood makes an especially good anchor slug.

Failing in all other uses, poles may be cut up for firewood. Yet they are not so well adapted to this use as might be thought. Cedar soon chars in the ordinary fireplace and burns with difficulty. It is a fact testified to by many operators that a pole which catches fire from a defective insulator will easily burn down at 2 a. m. in a heavy rainstorm, but will when cut and dry stubbornly refuse to burn up in a perfectly good fireplace.

USE OF DISCARDED CROSS-ARMS

Non-standard cross-arms, even though in good condition, are difficult to place, since they will not match with new material and are especially bothersome when double-arm pairs are desired. Older cross-arms are liable to be small in every dimension—shorter, of smaller cross-section or with less clearance between pinholes. The clearance between the pins next to the pole is often less than permitted by law or good practice. A solution of the difficulty as to second-hand arms lies in their use as service buck-arms. Though more expensive than brackets, the buck-arm has advantages as to clearances, making a neat and safe installation, especially where a number of services leave a pole in a variety of directions.

One company which utilizes retired non-standard arms for buck-arms places an average of 2000 arms per year in such service, thereby utilizing the entire non-standard accumulation. If these second-hand arms are found to have a "pole-pin" separation too narrow to

comply with standard practice, it is a good plan to fill one of the pole-pin holes with a 1½-in. (4.31-cm.) wooden plug which can be nailed in place. A new through-bolt hole can then be drilled about 4 in. (10.16 cm.) off center toward the plugged hole and the arm mounted off center. This increases the clearance between the remaining pole pin and the pole by 4 in. Three pin positions remain available for use, these being all that are required for a lighting service. The offset buck-arm does not look bad on a pole, and, besides the advantage of increase clearance, it permits the use of one short or non-standard cross-arm brace with each arm, thus utilizing an additional second-hand item (see Fig. 4).

Other uses to which old cross-arms may be put are those which might be filled by any lumber of similar size, such as fence posts for wire fences, blocking for the storage of poles, cross-arms and other materials, cross-pieces for pole-hole covers, and, in general, rough construction work.

REINSTALLING OLD WIRE

Weatherproof copper wire removed from the lines should be carefully examined before it is reinstalled. If the impregnating compounds have been fried out, it will be better to skim it at once and use it where bare wire is permissible rather than to have it become stringy and an eyesore in a short time. Many places will be found in suburban and agricultural districts where bare wire is as useful as weatherproof, provided that it has retained its strength. Some of the very oldest wire removed, particularly solid wire in sizes from No. 2 up, will be found to be crystallized and weakened by repeated bending. Such wires should not be reinstalled on the lines, as they will only result in failures. In reeling up second-hand wire for line use, the old splices should be carefully examined. Many will be found weak and of poor workmanship, since

FIG. 2—HOME-MADE SECONDARY DEAD-ENDS USING ARC CHAIN

splicing was not so carefully done in the old days as now.

Short lengths of good quality, either weatherproof or bare, should be saved for ties. Annealed wire makes a better tie than medium hard-drawn, particularly when tying bare wire with bare wire. If wire is annealed and the insulation is removed by burning, the fire

should be started in the open, not in any form of furnace, and the wire must not be allowed to become overheated or it will lose its strength.

One use to which larger sizes of copper can be put after the insulation has worn off, and even after the wire has crystallized, is for grounded neutrals in underground secondaries. Where secondaries are well grounded at transformers and where practically every service conduit is likewise grounded and tied to the neutral, insulated neutrals would appear an unnecessary expense. Such systems are in operation, using bare neutrals entirely from the transformers to the various branch terminals at customers' entrance fuses, and no difficulties have been experienced due to loading and heating of adjacent cable coverings by leakage currents.

Bare scraps may be used as ground wires on transformer poles, provided that the vertical run is covered

FIGS. 3 AND 4—UTILIZATION OF OLD POLES AND CROSS-ARMS

Fig. 3 is a square redwood pole originally set in 1888, removed in 1913, cut from 45 ft. to 40 ft. and now doing duty in a suburban line. The pole was in service thirty years and is good for twenty more. Fig. 4 is an offset service buck-arm using second-hand arm and one short brace.

with a wood molding or fiber conduit, as is usually done even where non-weatherproof wire is employed.

PLACES FOR RETIRED INSULATORS

Insulators, especially pin-type insulators, present a different problem. Unless entirely destroyed they are more liable to be unsuitable because of inadequacy than because of deterioration. Owing to developments made by the manufacturers, greater factors of safety can be required and are used than were deemed necessary some years ago, so that many of the insulators being retired may no longer be utilized for their designed voltage. Companies having lines of various voltages are sometimes enabled to use old insulators on lower-voltage systems. This seldom pays, however, if the voltage steps are large, so that cumbersome insulators, subject to breakage and unnecessarily large pins, must be provided for use at the lower pressure. Some companies serving extensive territories in which a variety of service conditions are encountered find that insulators which have become inadequate in one district may be utilized for lines of similar voltage in sections where conditions are less severe. For instance, companies with lines along the seacoast may find that insulators which have proved to be inadequate under fog and spray conditions will give perfect service on the same lines in interior valleys.

Glass insulators, even of obsolete type, will ordinarily be found useful on secondary systems, provided that they have standard pin holes. Sizes smaller than those now standard for line construction should be used on service brackets.

On the whole, porcelain insulators, on account of their limited uses, offer a difficult problem when obsolete, and large numbers must be scrapped. It pays to have a few old types available for emergency connections and testing about any plant, for insulating stools and staging and for temporary service during construction work.

Strain insulators are more flexible devices, and if in good condition use may be found for most obsolete types. Glass "bobs," formerly used in large quantities in guys, are being abandoned for more dependable porcelain, but they will be found quite adequate for the house ends of service loops. They may also be used in the lighter types of guys, such as arm and bridle guys, and in dead-ending light secondaries. Two-bolt and small obsolete three-bolt guy chains should also be used up on these light guys.

Some prototypes of the modern clevis cap suspension insulator which are useful in dead-ending 11-kv. to 22-kv. lines are with difficulty made up into strings, as they have an eye at each end. These may be made up into neat pairs by using one new clevis cap unit at the line end of each pair, thus eliminating connecting links.

USES FOR OLD PINS, SPACE BOLTS, ETC.

The lead bushing is an exceedingly useful device in remodeling metal pins. Combination pins having a steel through bolt, porcelain base and wood thimble are becoming obsolete with most companies in high-voltage work, owing to the rapid digesting or destruction of the wood. The wood thimbles may be readily split off, and by means of plaster-of-paris molds these may be replaced by new lead thimbles, resulting in a pin actually superior in strength and durability to the original article. Renovated pins of this type are shown in Fig. 1. Metal pins with obsolete threads may sometimes be bushed with lead and thus rendered serviceable where otherwise they must be scrapped.

All-wood pins are of little service when deteriorated, although the shanks may be used as the pin-hole plugs for three-pin service buck-arms as previously mentioned.

One use of obsolete small cross-arm braces was mentioned in connection with these buck-arms. Other applications will be found in connection with special construction work, particularly around substations.

Light space bolts and through bolts, usually $\frac{1}{2}$ in. (1.27 cm.) where $\frac{5}{8}$ in. (1.59 cm.) are now standard, will of course be found of service in construction around any plant. There are also a few special uses to which these may be put in connection with line work. Where angle-iron braces are used with large-size cross-arms, two $\frac{1}{2}$ -in. (1.27-cm.) bolts are required with each brace, and these may be made up from old through bolts which have been shortened. The threaded end of a cut-off space bolt may be used as a stud with that type of pin which consists of a malleable-iron top and a separable stud bolt. Such studs with two nuts (one battered on) make good short bolts for attaching strain insulators to universal dead-ending clevises or similar devices. It is interesting to note that one of the few

advantages which cut-thread have over rolled-thread bolts is in their use as second-hand material, the cut thread permitting modification for other uses better.

Pole steps are not installed by power companies these days to such an extent as formerly. At one time all poles were stepped. Now it is usually the custom to step only transformer, switch and arc-lamp poles and sometimes not even these. Consequently most companies accumulate a considerable stock of second-hand pole steps. On account of the hook shape they have many useful purposes in miscellaneous work. They can be employed as spikes for industrial railways, as tent stakes, as cable racks in manholes, and as form hooks and anchors for future extensions in concrete work. They are useful about a warehouse as hooks for tools and ropes. A few may be used inverted as hooks to hold the ring at the lower end of arc-lamp chains or ropes where reels are not used. Occasionally they may serve as lag screws. The communication companies are still faithful to pole steps, and they should not be overlooked as a possible outlet for the surplus.

Many forms of metal scrap are useful as reinforcing in concrete. If concrete anchor slugs are used, old bolts, pole steps and braces will make excellent reinforcing. Short pieces of guy cable, whether new or retired, are also useful as reinforcing in any concrete building work. There is always a considerable waste in guying a line unless the men are careful in cutting to length and use short ends between the pole and the strain insulator. Where steel conductors are used short pieces of guy cable are unraveled for ties.

Brackets of old types can usually be disposed of in special service work. In these days of military camps wood brackets are useful for distribution systems among the tents. One company wiring a large camp used up a year's accumulation stringing secondaries bracketed on short square poles between tent groups and to latrines and messhouses.

Inclosed carbon arcs are giving way to gas-filled tungsten-filament units. The retired arcs may often be employed with slight modifications to house the incandescent lamps. Arc-lamp coils, whether series or shunt, are very useful around repair shops or laboratories and in the manufacture of home-made relays, switch mechanisms, etc. Therefore a number should be saved when lamps are scrapped. Arc-lamp carbons of obsolete size may be set up in groups and used as rheostats. A few old arc reels will be found serviceable around any plant as light hoists. Old shades, whether glass or steel, may be employed as reflectors with incandescent lamps. Clear-glass globes of the closed type can be sold to furniture stores for fish globes. Arc-lamp chains in long or short pieces will be found to serve many useful purposes. They are handy in threading through vertical runs of conduit. Short lengths will serve as pipe or conduit hangers under buildings. A secondary dead-end of the strain type, readily attachable to the end of any space or through-bolt and having all metal parts galvanized, may be cheaply made up with a porcelain strain insulator, a short piece of arc chain, a lap link and a dead-ending clevis (Fig. 2).

DISPOSING OF OTHER MATERIALS

Transformers and meters when retired are generally returned to the manufacturers for credit on new goods. When this is not done some parts may be

saved from the scrap pile to advantage. Transformer cases with leads intact make excellent waterproof cases for the installation of meters, instrument transformers or relays in the open. Occasionally a transformer case is needed in camouflaging a check meter on the service of a suspected customer, and a small quantity of transformer laminations are always of use about a shop and should be saved out of the scrap heap. The same is true of coils with the insulation burned off, if the wire is not damaged, as a quantity of binding wire is needed about any shop or test room for connections, etc.

Linemen's gloves after breakdown on test are useful where acids or other corrosive substances are employed, as for instance in handling materials in the lye solution in gas-meter shops, packing plants, etc.

The disposition of short lengths of lead-covered cable is always a problem. These accumulate with startling rapidity, even when every effort is made to utilize the shortest length in stock on each new installation. When cable is scrapped it generally pays to strip the lead. When flattened out this is useful for packing, washers, pipe saddles, etc. When these are not needed the sheath can be melted into solder or pin thimbles.

Packing material should be conserved in the same manner as supplies. Sacks are useful in putting up orders for local line crews, and boxes, barrels and crates should be available for goods sent to district storerooms. Heavy lumber from large crates should be saved for pole-hole covers. Barrels are often necessary when holes are to be dug in sandy or marshy ground.

It is advisable to provide a special workbench for the renovation of discarded line material and to keep at least one storeroom employee continuously at this work, so that he may become expert in decisions upon the utility and proper disposal of the various devices retired. In any case the foremen of the plant blacksmith, machine and carpenter shops, who ordinarily do not come into close contact with the line department, should be made familiar with overstock and obsolete materials, such as braces, bolts and lag screws. A knowledge on the part of these men of what is available will frequently save time and expense by permitting the substitution of second-hand line hardware for new stock in various routine repair and construction jobs.

It is hoped that this discussion will lead engineers to contribute ideas on how other economies can be effected.

Plan Coal-Saving Campaign Among Industrial Consumers

A nation-wide campaign for economy in the use of coal among steam plants will be undertaken by the United States Fuel Administration. The campaign was determined upon following a conference of representatives of the Fuel Administration, the Bureau of Mines and the American Society of Mechanical Engineers. The intention is to provide for an inspection of steam plants and practical demonstrations in scientific firing that will afford higher efficiency and smaller consumption of coal. The educational campaign planned will be conducted by the Bureau of Mines, with the full backing of the Fuel Administration.

Public Steam and Electrical Systems

An Analysis of the Building Heating Situation in Large Cities, Made with Reference to the Distribution of Power from Central Stations—Comparative Tables of Steam and Electric Heat

BY J. A. M'HOLLAN

Vice-President of the Martin-McHollan Company

COMPARED with the remarkable expansion which has taken place within recent years in the public systems of electrical supply, the development of public systems of steam distribution has been practically at a standstill. Such extensions as have taken place have been confined chiefly to cities of moderate size or to territories where the buildings served are of the smaller or residential class. Yet a public system of steam distribution has manifest advantages for the business districts of a large city, and the purchase of steam would be generally adopted by manufacturers and building operators if the service was provided at reasonable rates. As a companion service to that provided by the electrical corporations a public system of steam supply presents many features of advantage, but before such a development can receive serious consideration from the electrical interests it must be shown not only that the steam can be produced, distributed and disposed of at rates sufficiently low to secure the business, but that the sale of steam to such buildings will also promote the purchase of the electric service.

The striking success which has attended the operation of electric companies in the great cities of America has no direct bearing on the practicability of a public system of steam supply. There is a fundamental difference between the conditions that govern the production, distribution and sale of steam as compared with electricity, and the advantages are almost entirely on the side of the electrical industry.

A forceful illustration of the difference between steam and electric systems is furnished by the percent-

pened this year, the cost of steam at the station is increased by 39 per cent of the assumed sale price of 45 cents per 1000 lb., while that of electricity is increased by 10 per cent of the assumed sale price of 3 cents per kilowatt-hour. In a steam system an increase in the cost of fuel is of prime importance. In an electrical system it affects the margin of profit to only a moderate extent. The sale prices assumed for steam and electricity in the above comparison are arbitrary, except in the sense that each price may be regarded as

FIG. 1—MONTHLY VARIATIONS AND STEAM OUTPUT IN OFFICE BUILDINGS WHERE ELECTRICITY IS PURCHASED

a wholesale rate on a large quantity used. The comparison may be applied on the basis of retail prices with similar results.

The opinion is generally held by engineers that inasmuch as each system deals with the production and distribution of energy, and as steam is required in many large buildings for purposes which cannot at the present time be served economically by electricity, there are substantial advantages in having both systems under one control so as to avoid wasteful competition and unnecessary duplication of equipment. A few years ago such a view would probably have been correct, but a review of steam and electrical development up to the present day will serve to show that the field for electrical application in the large commercial buildings is as steadily increasing as that for steam is decreasing.

This is well illustrated by the figures given in Table II for two large office buildings in New York City.

Perhaps the most important factor in determining the future of steam companies in the larger cities of America will be the outcome of the controversy over the economy of operating private electrical power plants as compared with purchasing the electricity from outside sources. The extent to which the operation of these power plants is likely to be displaced by the purchase of the electricity has a most important bearing on the future of steam supply companies. When a private electrical power plant is operated to produce electric energy the effect is to maintain a high monthly

TABLE I—COMPARISON OF STEAM AND ELECTRIC PRODUCTION COSTS IN CENTRAL STATIONS

	STEAM COSTS			ELECTRIC COSTS		
	Cents per 1000 Lb.	Per Cent of Net Production Cost	Per Cent of Sale Price at 45 Cents per 1000 Lb.	Cents per Kw.-hr.	Per Cent of Net Production Cost	Per Cent of Sale Price at 3 Cents per Kw.-hr.
Labor.....	2.6	10.5	5.8	0.08	17.3	2.7
Fuel.....	17.5	71.5	38.8	0.3	65.2	10.0
Waste removal.....	0.7	2.8	1.5	0.01	2.2	0.3
Water.....	1.9	7.8	4.2	0.004	0.9	0.1
upkeep, repairs and supplies.....	1.8	7.4	4.1	0.066	14.4	2.2
Cost at station....	24.5	100	54.4	0.46	100	15.3

age of operating costs in large central stations given in Table I.

These figures are based on fuel prices prevailing before the war and would vary according to locality. In the event of fuel costs being doubled, as actually hap-

load factor, and when the electric service is purchased from outside sources there is a marked decrease during at least one-half of the year in the total amount of steam used. In the more modern buildings it now is an established policy to purchase the electric energy, and the other machinery is usually selected so that no steam-

TABLE II—USAGES OF STEAM AND ELECTRICITY IN OFFICE BUILDINGS

*To produce electricity.

using machinery has to be operated in the summer season. The monthly variations of the steam usages in three large office buildings are shown in Diagram I. In two of these steam is used only during the winter season, no steam being required in the summer months of the year. Diagrams II and III show the steam re-

its most desirable business, not in new buildings, but in existing buildings where the elevators and pumping services are steam-operated, and particularly in those where the electric service is produced by means of private power plants.

The purchase of electric service in large commercial buildings divides itself into two distinct and separate subdivisions:

(1) In new buildings where the purchase of the electric service is considered at the time of the erection of the building.

(2) In existing buildings where private power plant machinery is already provided and in operation.

In existing buildings where private power plants have already been installed and are maintained in operation the situation is less favorable to the central station. In the older buildings, where the machinery is provided, the operation of the power plant is more or less a fixed feature and likely to be disturbed when a failure in operation occurs, when extensions or alterations become necessary, or when electric rates are reduced.

Perhaps the greatest obstacle to the extension of the central-station service to such structures is the uncertainty that surrounds the cost of operating the steam services other than the production of electricity. When electric service is purchased it is always necessary to continue operating certain high-pressure steam services.

The electrical corporations are in a most peculiar situation. To secure business which would increase their load factor and would ultimately enable them to effect a general reduction in rates both to large and small consumers, they must step out of their particular field of supplying electric energy and must guarantee or satisfy prospective large customers, in some way or other, as to the cost of the steam services which are left to be provided when the electricity is purchased. The cost of the steam services is almost invariably higher than the cost of the purchased electricity, although this

FIGS. 2 AND 3—MONTHLY VARIATIONS IN STEAM OUTPUT IN BUILDINGS WHERE ELECTRIC POWER PLANTS HAVE BEEN DISCONTINUED

quirements in several types of modern buildings where private plants have been shut down.

In buildings where machinery is operated to produce electric energy the monthly output of steam is more constant. A high rate of usage is maintained over the summer season and the load is of a character that would be a desirable addition to a steam supply company. Load curves of various classes of buildings are shown in Diagrams IV and V. A brief study of these will serve to show that a steam company can derive

fact is not generally appreciated. The general proportion in buildings where electricity is purchased is as follows: Cost of purchased electricity, 30 per cent of total annual costs; cost of high-pressure steam services and heating (inclusive of fuel, labor, ash removal, supplies and repairs, labor insurance, supplies and repairs to machinery), 70 per cent.

It is to be noted that the items which make up the cost of the steam services are flexible and subject to increase or decrease proportionately with the care and

telligence with which the equipment is operated, and is clearly to the interests of an electrical corporation to see that they are provided at the minimum cost. The tendency of the present age in the large cities of America is towards electrification, and the steady extension in this direction is a menace to the future of the steam supply business. Elevators can be more

FIG. 4—MONTHLY VARIATIONS IN STEAM OUTPUT IN OFFICE BUILDINGS WITH PRIVATE POWER PLANTS IN OPERATION

economically and more effectively operated by electricity than by steam-produced hydraulic power. Pumping, not only of water, but of sewage, can be economically provided by electric energy. Refrigeration lends itself to the use of electricity, and it is almost certain that the public steam systems must find their future business largely in the heating of buildings. They will have to meet a problem of transacting a profitable business with equipment which may have to remain disused for one-half of the year, and the significant fact must not be lost sight of that the use of exhaust steam has not thus far been found practicable in central-station heating systems. The enormous expense of installing the large mains when exhaust steam is required and the necessity of maintaining a high pressure throughout the system has led to the general use of piping systems supplied with high-pressure steam. If the electrical corporations can completely displace the operation of private power plants, there is left for the steam company only the heating business, extending over the winter months and of a variable character that does not lend itself to a profitable use of the equipment.

The question arises whether the use of steam for heating may be displaced by gas or electricity or other heating agent. Steam is superior to gas in that the air in the space heated is not polluted by the gases of combustion. Electrical heating, on the other hand, is superior both to gas and steam, but cannot be used on account of the excessive cost. A series of interesting experiments conducted by J. D. Ross, superintendent of the Seattle municipal plant, discloses that electrical heating is comparable to steam with coal at \$6 per ton and electricity at 0.4 cent per kilowatt-hour. In connection with this question of electrical heating it may

be of interest to consider the magnitude of the problem of heating a large building by means of electricity. An interesting example is available in the group of institutional buildings in New York City upon which observations were made on the power, lighting and heating services over an entire year. The usages for light and power in this group of buildings amounted during the year of the test to approximately 712,000 kw.-hr. In this, as in most other tall buildings, the heating of the building is only one of the services that are steam-operated. The elevators are driven by steam pumps; the house water, refrigeration and auxiliary engine-room services are provided by means of steam-using apparatus. If these appliances were rearranged so as to be electrically operated, the increase in the electrical usages would be approximately doubled, or a total usage, without the heating of the building or the hot-water supply, of 1,500,000 kw.-hr. The heating of the buildings absorbed 30,000,000,000 heat units and the heating of the water supply absorbed 2,000,000,000 heat units. Of these amounts perhaps about 20 per cent was used in the form of piping losses and other wastages, leaving a net total of about 26,000,000,000 to be provided electrically, which at 100 per cent efficiency in electrical heaters would correspond to a total usage of energy for heating purposes of about 8,000,000 kw.-hr., or about eleven times the consumption under test conditions with only the power and lighting services provided by means of electricity. In the case of a twelve-story hotel the electric energy required for heating would be about 2,500,000 kw.-hr., or fifteen times the usage of electricity for power and lighting purposes. These totals are for individual buildings and serve to show the magnitude of the prob-

FIG. 5—MONTHLY VARIATIONS IN STEAM OUTPUT IN FACTORIES AND HOTELS WITH PRIVATE POWER PLANTS IN OPERATION

lem of electrical heating in large buildings. It is impossible to predict future developments in the electrical industry, but if an increasing price of fuel and a decreasing rate for electric service should force electrical heating to be considered as an economic development it can readily be seen that not only will costly and radical changes be required in the underground electrical systems in our large cities, but the present huge power stations will be totally inadequate to meet requirements.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

FEATURES OF CHICAGO'S NEW PARKWAY LIGHTING SYSTEM

Details of Construction, Including Method of Running Circuits and Use of Series-Multiple Transformers with Special Couplings

Several unusual engineering features are included in the three additions to the extensive boulevard and parkway lighting system now being completed by the South Park Commission in Chicago.

The typical parkway block contains four lamps between street intersections. In so far as possible the existing 5000-volt cable will be used, since it has been determined that the rubber insulation, although some of it has been in service since the World's Fair of 1893, is as good as can be purchased to-day. The adoption of this plan made it possible to purchase 50 per cent less cable than would otherwise have been necessary. All circuits will be laid in 3-in. (7.6-cm.) fiber conduit in the grass plot.

The standards and lanterns, which were selected for their artistic design, stand 13 ft. 2 in. (4 m.) high to the lamp center and are bolted to a concrete base. The lantern faces are fitted with "Synite" glass to diffuse

each. The standards which these units will replace are of the old World's Fair type.

The primary leads of each series-multiple transformer will be equipped with detachable couplings. This feature, in addition to eliminating the slow and expensive construction involved in using wiped joints, also makes it possible to disconnect any lamp-post transformer readily. This is of value in testing and changing transformers. The details of the disconnecting feature are shown in Fig. 5. The estimated cost of this part of the system will be about \$57,000, or \$178 per standard.

In the 0.5-mile (0.8-km.) stretch of Garfield Boulevard which will be relighted 124 single-lamp standards will be set. These units will be placed four abreast on two parallel drives separated by a grass plot and will utilize circuits laid to serve eighteen old 1000-watt lamps on World's Fair standards. The new units will be mounted on the Universal Concrete Products Company concrete posts set about 80 ft. (24.4 m.) apart. The posts will be set in concrete and will be of such height that the light center will be 10 ft. 6 in. (3.2 m.) above the street. In order to take the fullest advantage of the existing cable and at the same time to give as much light as possible to the merchants who are

FIGS. 1, 2, 3, 4 AND 5—CIRCUITS FOR SUPPLYING DOUBLE-LANTERN STANDARDS; UNIT FOR RESIDENTIAL STREETS; MICHIGAN BOULEVARD STANDARD; CONCRETE STANDARD FOR WHITE-WAY LIGHTING; DISCONNECTING FEATURES FOR PRIMARY LEADS OF SERIES-MULTIPLE TRANSFORMER

the light from the 250-cp. gas-filled tungsten lamp which each will contain. The two lamps on each standard will be operated in series from a 7.5-amp. circuit connected to a series-multiple transformer in the base of the post. Low-voltage film cut-outs of special design will prevent the complete failure of a unit through the failure of a single lamp. According to reports these lighting standards, which cost \$40 each when the contracts were let two years ago, could not be duplicated now for \$80

helping pay for this 0.5-mile (0.8-km.) stretch, larger lamps will be used in those units on the property sides than in those on the boulevard planting space. It is probable that the property-side lamps will be rated at 250 cp. and the others at 100 cp. Alba diffusing globes will be used throughout. The total estimated cost of this lighting, which is of the straight-series type, will be about \$15,000, of which the merchants will pay one-third. This makes the cost per post about \$120.

PREVENTING INSTALLATION OF WRONG-SIZED FUSES

Two Types of Stickers Printed in Red Ink Are Used to Caution Unskilled Workmen Regarding the Sizes of Fuses to Use

Safety stickers pasted on fuse cabinets by the Oklahoma Inspection Bureau serve a twofold purpose. They are a precaution against the use of wrong-sized fuses, and they emphasize the fact that it is danger-

ous to let the body become the connecting link between live wires and a good ground. When the fuse sticker is pasted in the cabinet box and an inspector later discovers the wrong fuse in use he has tangible evidence that previous warning had been given and can act accordingly. H. J. Clark of the inspection bureau reports that the stickers are very effective.

METHOD OF TRANSPORTING LARGE POWER TRANSFORMERS

Core Packed and Case Crated So that the Entire Unit Could Be Shipped Lying Down—Skidding and Upraising Transformer

In shipping three 7500-kva. water-cooled transformers to the Northern States Power Company, St. Paul, Minn., the Westinghouse Electric & Manufacturing Company adopted a novel method of skidding and packing the transformers which might be used to advantage anywhere for transporting extra-heavy transformers where head room is limited. The units were so large that if shipped in the upright position on a drop-frame car they would have barely been within the maximum height permitted by structures over the railroads, etc. To avoid this difficulty a cradle was made for each transformer, in which it could be laid on one side.

The cradle consisted of three skids with heavy timber cross-pieces shaped to receive the curved case and a framework at right angles to one end of the skids. The parts were firmly fastened together and those at right angles braced by tie rods. The transformer case was laid in this cradle with its base against the vertical end of the cradle and held in place with straps and tie rods running through the skids. The ends of the skids under the vertical frame were cut diagonally to permit rocking the case into an upright position.

To prevent injury of the transformer windings, wood slats were fastened around the core so it would fit the case snugly. The cooling coils were left fastened to the transformer cover and a bracing was provided through the center of the coils to the top of the cover. The latter in turn was braced against the end of the car, thus serving to hold the transformer in place inside the tank.

In handling the cradle equal-length chains were attached to the top of the cradle side and the end of the skids under the top of the transformer so that when lifted by a crane each one would share the weight. To tilt the transformer into an upright position the chain fastened near the head of the transformer was raised while the other was let out. In this way rough jostling was avoided.

MOUNTING LOOM-MOTOR SWITCHES IN PAIRS

Handles Are Recessed in Disks and Short Connections by Means of Conduit Are Made to the Motors

Heavy duty switches for use on loom motors are now mounted in pairs on a single fuse box in some of the latest installations, as shown in the accompanying photograph. In a weave shed where hundreds of looms are in service and tended by young girls with no electrical or mechanical training simplicity of control, combined with entire safety of operation, is of vital importance, particularly where the motors are wound for 220 volts and upward. In the installation shown the looms are mounted with ends reversed, and the adjacent motors are thus brought within 2 in. or 3 in. (5 cm. or 7.6 cm.) of each other. Near the floor the intervening space is occupied by the pedestal, fuse box and switch pair shown.

HEAVY-DUTY SWITCHES FOR LOOM MOTORS

Each switch is of the most rugged type, capable of withstanding much abuse. The handles are recessed in disks marked for "off" and "on" positions, and short connections are run to the motors with BX conduit. Nothing short of deliberate destruction is likely to affect the operation of these units. It is feasible by staggering the loom motors with respect to the inter-

COST OF OPERATION OF CLUB ELECTRIC GRILL

Figures on Energy Consumption and Repair Cost at
New York Engineers' Club for Period
of One Year

Figures kept for one year on the cost of operation of the Buzzini electric grill at the Engineers' Club, New York City, show a weekly expense of \$11.02 for six grills with energy at 1 cent per kilowatt-hour, or less than \$2 per week per grill. The figures are as follows:

Number of grills	6
Grill renewals per year	12
Current, amp.	17.5
Voltage	240
Grill hours per week	245
Kilowatt-hours per week	1,029
Kilowatt-hours per annum	53,508
Per Year	
Cost of wire	\$25.00
Cost of wire coiling	2.50
Cost of millboard	1.00
Cost of labor	9.32
Total cost of renewals	\$37.82
Cost of operation per week for six grills:	
Energy, at 1 cent	\$10.29
Repairs, $\$37.82 \div 52$	0.73
Total cost	\$11.02
Total cost per annum	\$573.00

RANGE SALES SITUATION IN THE COMING YEAR

Evidence Points to a Curtailment of the Free-Time
and Installment Plans Formerly Followed by
Central Stations

Individual opinions of central-station sales managers in the electric range business in 1918 have been solicited by the ELECTRICAL WORLD. How the outlook appears to these men, some of whom are members of the electric range committee of the National Electric Light Association, may be summarized as follows: First, the sale of electric ranges will not be discontinued; second, there has already been established a certain amount of consumer demand for ranges; third, the methods of selling electric ranges will be changed, particularly in that it will be found difficult by the utilities to finance installations through long periods of free trials and installments to the extent formerly practiced.

A summary of the general situation by C. E. Michel, acting sales manager of the Union Electric Light & Power Company and chairman of the electric range committee of the N. E. L. A., is given in this letter:

I have about reached the following conclusions in connection with the range business:

First, the electric range has a very definite place in the economic conditions of to-day. This is particularly true of those communities in which coal can either not be secured at all or where, if secured, the price is so high that it is impossible to use it in the inefficient coal cooking range.

Second, other places in which electric range activity is clearly indicated are those sections of the country where natural gas is beginning to fail or has already failed and where electricity is available at a reasonable price.

Third, an important field is open in those sections where generating and line capacity is available and an intensified use of available circuits is desirable.

In the large central stations where intensive selling campaigns have been going on for the last two or three years I look for certain well-defined and carefully thought-out retrenchments. I do not believe that as a whole the central-station industry will continue to finance this business as it has in the past. It is quite possible, however, that this will have a wholesome effect on the business in general, as the objectionable trial feature which a great many of us have felt necessary in the introduction of the article will be sharply restricted and customers will be educated to pay a legitimate price for the range and its installation.

We are entering upon a difficult period of business life, and when we come out of the war a great many things will have a different aspect from that of to-day. Customs will probably be different, and readjustments will have to be made. The range manufacturer must be alert and awake to see that he shall find his proper place in the new arrangement of things. That this place will exist seems absolutely certain to me.

For the immediate future I see a sharp restriction in one fertile field, the apartment house, as, from the standpoint of both labor and material, the cost of apartment-house construction is to-day almost prohibitive. Buildings of a kind in which the electric range man is interested are not generally being constructed; there are a few notable exceptions to this, of course, but the statement as a whole is true. On the other hand, the field not affected by the slackness of building is so enormous and virgin in its nature that there should be a substantial sale of electric ranges.

Another prominent central-station sales manager, whose success with range selling is recognized, after stating that central stations would probably not push range sales this year on account of the prices of coal, capital and line materials, said:

In spite, however, of the above-mentioned factors, I think the demand for electric ranges is greater than ever, and if past methods could be employed during the coming year, I feel certain the sales would far surpass those accomplished in past years. Also past efforts have resulted in many central stations getting a considerable number of ranges on their lines, and this has served to educate the public to a large extent and is gradually creating a very healthy demand.

The fact that it has become almost universal practice in the sale of household equipment to sell it on the installment plan of course makes it difficult to sell ranges in quantities for cash and at list prices, as people have been educated to purchase all such household equipment on the installment plan. Moreover, the facts that the price of the electric range is about four times that of a gas range of similar style and size and that the customer can purchase a gas range on the installment plan will be factors working against sales in large quantities.

I dare say central stations will, however, be able to find enough customers who can pay cash and pay full price, and who live where the central station has the line capacity to care for the range without additional investment, to make possible a substantial sale of electric ranges. At least, we are finding this to be the case and at the same time have a number of attractive inquiries for range equipment for apartment buildings.

"CASH-AND-CARRY" PLAN APPLIED TO LIGHT BILLS

Instead of Delivering Bills to Customers Small Company Asks Customers to Call for Them and in This Way Reduce Expense

Lighting companies operating in small communities have been under a greater comparative strain during the past two years than those operating in larger places. With little opportunity to increase their load, with fixed

Electric Light and Power Bills

Will be ready for distribution at the Company's office

January 1st

We are discontinuing the old practice of delivering bills, and will be pleased to have you co-operate with us by calling for your bill promptly.

Respectfully,

Fayette County Utilities Co.

ADVERTISEMENT USED TO ANNOUNCE CHANGE IN BILLING METHOD

rates and the increasing cost of operation, these small companies, which never did as a class enjoy an enviable net profit, have been hard pushed these days to show any profit at all. To prevent disaster economies must be put into practice wherever possible. A single example of an economical measure particularly adaptable to the small-town property is outlined below. It is a method for cutting the cost of billing.

Several subsidiaries of the Utilities Development Corporation of Chicago have discontinued their old practice of distributing or mailing bills for electric service to consumers. Instead they now advertise that the bills are ready for distribution at the company's office and request customers to call for them. The companies which have tried the plan, according to Miss L. M. Beefield of the Utilities Development Corporation, are enthusiastic over its success.

The Fayette County Utilities Company, Oelwein, Iowa, one of the subsidiaries using the plan, reports that in November the expense of sending out the bills was approximately \$18.65 under the former method, and this represented the situation generally throughout the industry. This figure included payment of 1 cent per bill to the high-school boy who delivered the majority of the bills, besides the cost of envelopes, labor of folding, inclosing, sealing and stamping the remainder, plus postage. In December, under the new system, the expense was only \$7.50, namely \$2 for the advertisement and \$5 for postage on the bills which were not called for, plus about 50 cents for the envelopes. Seventy-five per cent of the bills were called for by Jan. 15 after the advertisement was printed making the announcement as of Jan. 1. A far greater proportion of bills called for is expected in succeeding months,

inasmuch as many customers failed to notice the advertisement and were awaiting the receipt of their bills by carrier.

In commenting on the plan the Oelwein company stated: "As a labor-saver the plan is a wonder. It does away with the folding and inclosing of the bills, together with the sealing and stamping of envelopes, and we certainly appreciate this extra time along about the latter part of the month!"

In trying out this plan, however, a word of caution is necessary. If a customer does not call for his statement, he should be billed. Otherwise a customer might get two or three months in arrears and find it difficult to make a settlement. In such a case not only does the company stand to take a loss which might wipe out the saving of a whole month but it is also likely to make an enemy.

SPECIAL CARTOON HELPS COMPLAINT DEPARTMENT

Indiana Commercial Department Finds that a Comic Drawing Is of Use in Solving the Problem of the Chronic Kicker

The commercial department of the Indiana Railways & Light Company, Kokomo, Ind., working in close co-operation with the claim department, has used the cartoon reproduced herewith to good advantage during the winter. O. M. Booher, contract agent for the company, speaking about the use of the cartoon, said: "Many hard-boiled kickers on winter lighting bills have been softened considerably by a tactful display of this picture. Of course we did not show it to the general public.

THIS CARTOON HAS HELPED A MIDDLE WEST COMPANY'S CLAIM DEPARTMENT BY APPEALING TO THE "KICKER'S" SENSE OF HUMOR

We picked our men with discretion. I find that if you can touch the funny spot of a man in the proper way, no harm comes from it, and he not only forgets to kick about his light bill but leaves the office a friend of yourself and the company. We used this picture so much during the last winter that we almost wore it out."

POSSIBILITIES IN THE ELECTROCHEMICAL LOAD

Outlook from the Standpoint of the Average Utility
Outlined, with a Discussion of the Limiting
Features

Considerable interest is being shown by central stations in the possibilities of electrochemical loads. At the recent meeting of the new-business men of the Ohio Electric Light Association C. A. Winder of Niagara Falls discussed the possibility of this load from the standpoint of the average company.

In considering the power consumption, Mr. Winder pointed out that aluminum consumed the largest amount of power per pound of finished product, approximately 2.5 kw.-hr., and is extremely dependent upon the low cost of power. Aluminium manufactories may exist a thousand miles from the center of gravity of distribution provided that power can be obtained at \$20 to \$25 per kilowatt-year. Artificial abrasives are next, with an energy consumption per pound of product of about half that for aluminum. The weight of finished material, however, is high, bringing the question of freight to the front; so much so, it is said, that if the haul of the finished material were 2000 miles (3218 km.), it is doubtful if an artificial abrasive plant could exist were power free. Under the prevailing price of water power, a 500-mile haul is given as a minimum. Calcium carbide, ferro alloys, sodium, chlorates and phosphorus are stated to be in practically the same position as artificial abrasives, namely, all require power at the prevailing water-power rates and within close proximity to the center of gravity of their consumption.

Ferrosilicon from an engineering standpoint can be made economically under normal circumstances in furnaces of about 10,000-hp. input, and the author states that apparently those companies now entering this field, contemplating this action, are planning on small furnaces. Such engineering, however, it is pointed out, cannot withstand the rigors of competition that will follow the war, the product now being very high in price. On the other hand, where companies insist upon entering this field to take advantage of the present high prices limited capital requires the installation of small furnaces. An engineering detail in this consideration that has been overlooked is that of frequencies. As a rule, central-station frequency is 60 cycles, but this practically precludes the operation of a ferrosilicon furnace of any size because of poor power factor resulting from high current and high frequency. Low frequency, it was stated, is a prime requisite to the successful operation of ferro-alloy, calcium carbide and similar furnaces. Most of the electric furnace products have been developed at Niagara Falls, where 25 cycles is the prevailing frequency. Even lower frequencies than this are perhaps preferable for electrochemical loads.

Furthermore, it is stated, if we consider off-peak power for such loads as artificial abrasives, ferro-alloys and calcium carbide, it is found that an 80 per cent load factor will so greatly increase the overhead costs that the power would have to be obtained without any cost at all to be attractive. Daily off-peak power for a carborundum furnace is absolutely out of the question, as the carborundum furnace operates for thirty-six hours. Neither, for the same reasons, can the

graphite furnace be considered. Valley power coming in periods of eight months is of economic possibilities that are not attractive to the average electrochemical industry.

The smallest user of power per ton output is perhaps the caustic and chlorine industry, and it is consequently the most affected by long freight hauls. Therefore these materials are manufactured near the market and are two of the few electrochemical industries that the central station perhaps may hope to attract. The only difficulty is primarily one of rates.

Summarizing, the author says: "It will be those companies located at the present economic positions and possessing water power, which in itself leads to the reduction of cost, whether it be by virtue of price, quantity or frequency, that will survive this ordeal. The central station may then find itself in a position of having connected load without the ability of the load absorbing its power, and it will take a long time again to build up the load to where it was when the war began. Obviously, the only classes of power users that the modern central station in large cities should solicit are japanning ovens, brass-melting and steel-melting furnaces where good scrap is available and other conditions correct, as well as hundreds of industrial power-consuming devices now being perfected or which have not as yet become commercially applicable but will be perfected under the present war stimulus."

POINTS TO CONSIDER IN CONNECTION WITH PUMPING

Data that the Power Engineer Should Provide the
Pump Manufacturer When Seeking a Choice of
Pump for Certain Application

R. L. Yates, assistant manager of the Platt Iron Works, Dayton, Ohio, in a paper presented before the industrial heating committee of the Ohio Electric Light Association, discussing pumping from the hydraulic point of view and defining the relation of the central-station power sales engineer to such jobs, included a list of questions the answers to which will acquaint the pump manufacturer with the requirements of any situation where pumps are to be installed. The questions are listed herewith:

1. Number of pumps required.
2. Nature of service.
3. Is vertical or horizontal installation desired?
4. Capacity required in gallons per minute.
5. Total pumping head, including suction, discharge head and friction head.
6. Maximum suction lift, including all friction.
7. Length and size of suction and discharge pipes, giving number and kind of elbows.
8. If pumping head is variable, give maximum variation for both suction and discharge.
9. If pump is below source of supply, will it be submerged or placed in a dry pit?
10. Will pump be required to operate continuously? If not, at what intervals?
11. Nature of liquid to be pumped—hot, clear, fresh, alkaline, cold, gritty, salt, acidulous.
12. If pump is belt-driven, give speed and diameter of pulley.
13. Furnish certified motor-dimension print.
14. Make sketch of proposed pump setting, showing piping.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Armature Reaction in Rotary Converters.—G. BADEY.—Armature reaction in rotary converters is not negligible. It may be classified as of two kinds—fixed and oscillating. The first, expressed in terms of direct-current ampere-turns, affects the performance in the same manner as the attenuated armature reaction of direct-current apparatus. The second should be deadened or attenuated by the proper grouping of the machines. Examples are worked out for (1) a theoretical case of an infinite number of phases and a sinusoidal field; (2) a case of a finite number of phases and a sinusoidal field; (3) the case of a monophasic converter.—*Revue Générale de l'Electricité*, Feb. 2, 1918.

Generation, Transmission and Distribution

Electric Waves.—W. S. FRANKLIN and BARRY MC-NUTT.—Discussion of the simplest aspects of the dynamics of wave motion. While differential equations are used throughout, mechanical analogies are used extensively to make the explanations intelligible to any one who has studied physics. The discussions may be divided into the following parts among others: Expression of a traveling curve as a partial differential equation; method of handling undetermined constants and functions in the solution of ordinary and partial differential equations respectively; reflection of waves and change of phase caused thereby; differential equations of electric wave motion on a transmission line; effect of traveling distribution of current and voltage; mutually sustaining current and voltage distributions; what determines wave form; transmission-line oscillations which follow switching, etc.—*Journal of Western Society of Engineers*, November, 1917.

Bonus Plan Reduces the Consumption of Coal at Manila.—B. H. BLAISDELL.—By dividing any saving effected with power-plant employees the Manila Electric Railway & Light Corporation has been able to increase wages of eighty men, more or less, by about \$700 per month. An outline of the bonus system for the power-plant employees is given in the article by the author. An illustration of a peg board, 18 in. (45.7 cm.) in diameter, used in stimulating competition in fuel saving among the power-plant watches, is also shown. The author states that the bonus system of wages has been in operation for about two and one-half years, with the most gratifying results. The B.t.u. consumption per switchboard kilowatt-hour at the present time is nearly 25 per cent less than it was three years ago. The present saving in fuel cost, based on the latest standard of fuel efficiency, put in effect Sept. 1, 1917, is 8.75 per cent. The company and the employees are equal partners, sharing alike the results obtained from fuel saving, a procedure which escapes the criticism that is sure to arise when a company appropriates the lion's share of the gain for itself.—*Electric Railway Journal*, Feb. 16, 1918.

Installations, Systems and Appliances

Calculation of Discharge Resistances.—PAUL GIRAULT.—In designing a discharge resistor intended to protect apparatus possessing self-inductance against rupture from excessive tensions the following should be determined: (1) The maximum rate of voltage rise (2) the energy dissipated in the discharge resistor after the rupture; (3) the power lost permanently in the resistor. All these are easily calculable. The author presents simple formulas, with a particular application to an inductor circuit.—*Revue Générale de l'Electricité* Jan. 19, 1918.

Electric Pumping.—H. W. WAGNER.—An analysis of operating records collected from various sources, information obtained from discussing different operators problems, the design and characteristics of different types of pumps, cost data, and various tests and service records and general statistics. The booklet is limited to those phases which affect directly electric pumping as compared with engine pumping. Considerable space is given to pumps, while related material which may be found in handbooks, textbooks, etc., is omitted or condensed as much as possible. Conclusions drawn from actual practice as well as live data are elaborated. The booklet is divided into five general sections, the introduction, the summary and conclusions, the equipment and operation, analyses of costs, and results of tests and operating records. The summary is written for the reader who wishes condensed information in plain words. Numerous tables are included giving summarized data, manufacturers' specifications, water consumption, results of tests and operating records.—*Bulletin 46, Engineering Experiment Station, Ames, Iowa*.

Electric Welding.—JEAN GUERNER.—An examination into the advantages of electric welding as compared with other methods. Welding by the arc process, mixed (gas and electric) welding and welding by the resistance method are discussed in turn, and the author considers how these different methods apply to various metals and products. He holds that, except for very large pieces, electric welding is always advantageous for continuous work of an extent sufficient to warrant the installation of special generating machinery.—*Revue Générale de l'Electricité*, Feb. 2, 1918.

Electrophysics and Magnetism

Unipolar Induction and Electron Theory.—GEORGE B. PEGRAM.—The author describes experiments that confirm the conclusions of Barnett and Kennard regarding unipolar induction, that the seat of electromotive force is in a moving conductor and is entirely independent of the rotation of the magnetic field. The facts regarding unipolar induction are in accordance with the theory of relativity. According to the well-known mathematical development from the Maxwell field equations in the Lorentz form, there is no force exerted on a sta-

tionary electron, therefore there is no emf. induced in stationary conductors in the vicinity of a steadily spinning solenoid carrying a constant current. On the other hand, when the electron is moving there is an emf. on electrons in moving conductors, which may be easily seen to be quantitatively just what would be computed on the "rate-of-cutting-magnetic-lines scheme," supposing that the lines of the magnetic field would remain stationary with the conductors rotating. Although the conclusion that no emf. is set up in stationary parts of the circuits in a unipolar induction experiment follows immediately from the electron theory, many well-trained physicists and engineers at first are inclined to disagree with the conclusion. They are accustomed to the experience that in general the motion of magnetic fields sets up an electromotive force in the neighboring conductors. They have not examined the rate of variation of the vector potential, which is the only function adequate to express the emf. at a point in the stationary conductors.—*Physical Review*, December, 1917.

Thermal Expansion of Tungsten at Incandescent Temperatures.—A. G. WORTHING.—From experiments made by the author of this paper, the coefficients of expansion at 300 deg. K., 1300 deg. K. and 2300 deg. K. are respectively 4.44×10^{-6} , 5.19×10^{-6} and 7.26×10^{-6} . These values are about one-third greater than those given by Fink.—*Physical Review*, December, 1917.

Electrical Porcelain.—G. I. GILCHREST and T. A. KLINEFELTER.—The object of this article is to bring about a better understanding between production and operating engineers, particularly that the latter may understand the manufacturing standpoint. First, the manufacture of electrical porcelain is outlined step by step; next, the data obtained from an investigation of porcelain mixes and ingredients and their influence on design are discussed, and finally the design itself is taken up.—*Electric Journal*, February, 1918.

Units, Measurements and Instruments

An Optical Pyrometer.—PAUL D. FOOTE.—Two forms of current-measuring instrument are described, one of which is strictly a hot-wire ammeter with the hot wire at a temperature between 600 deg. and 1500 deg. C., and the other a device for adjusting a current, by optical methods alone, to any preassigned value. The first method should prove especially useful for the accurate measurement of alternating current of high frequency. The precision that may be expected in measurement of current through the pyrometer lamp when the instrument is sighted on a source of constant brightness is shown.—*Journal of Washington Academy of Sciences*, Feb. 19, 1918.

The Selection of an Electricity Meter.—A comprehensive method by which different meters can be classed is described. Electricity meters are usually bought in quantities on period contract terms. This makes a right choice particularly desirable, because of the large numbers of meters involved, the long period which must elapse before any desired change can be made, and, for reasons of standardization, the disadvantage of frequent changes. The qualifications of a meter fall under two heads, namely, quality and cost. There are certain other considerations relating to the commercial service given by the different manufacturers. The author tabulates his conclusions thus:

Choice of meter should be guided by:

1. Quality, denoted by:

1. Accuracy, viz.:

(a) Initial accuracy, depending on, first, electrical design (affecting errors due to variation of load, voltage, temperature, frequency, power factor and balance of load) and also concerned with starting current, external magnetism, shunt running, insulation resistance and overload capacity; second, workmanship, affecting friction.

(b) Accuracy after service, depending on, first, durability of materials, jewels etc.; second, stability of adjustments, general robustness, etc.; third, type.

2. Finish.

3. Convenience in handling, fixing, sealing and reading.

II. Cost: (1) Prime; (2) running; (3) maintenance.

III. Commercial service: (1) Delivery; (2) facilities for examination and repair on customers' premises; (3) guarantees; (4) courtesy.

—London *Electrical Review*, Jan. 25, 1918.

Telegraphy, Telephony and Signals

Artificial Telephone Lines.—J. B. POMEY.—The artificial line known as the H line, so useful in the telephonic studies of laboratories, is patented, and the author therefore considers whether a natural line cannot be represented without infringing on this method. He describes how an artificial line can be constituted with a Wheatstone bridge or any other arrangement desired provided that an adjustment of the branches for the frequencies desired presents no obstacle.—*Revue Générale de l'Electricité*, Jan. 26, 1918.

Miscellaneous

Collapse of Short Thin Tubes.—A. P. CARMAN.—Data are given in this paper which may be applied in designing condenser tubes. The greater part of the paper refers to a series of tests on short, thin tubes of seamless steel, seamless brass, aluminum, glass and rubber. The purpose of these tests was to find an equation by the application of which the pressure required to collapse a tube can be calculated when the dimensions of the tube and the elastic properties of the material are known.—*Bulletin 99, Engineering Experiment Station, Urbana, Ill.*

Charging for Electrical Energy According to the Consumer's Power Factor.—P. BOUCHEROT.—Power-factor conditions in France have become very bad since the war began, and not the least important of the means advocated for ameliorating them is that of obtaining the co-operation of the customers of the central station by the adoption of a rational tariff for electrical energy based upon their individual power factors. The author of this article maintains (1) that it would be neither easy nor right to charge for the apparent power; (2) that it is almost exclusively the reactive power of the customer that affects the expenses of the network; (3) that there is a simple method easily applicable to existing meters that will take account of this reactive power. This method consists of the introduction of a small coil of self-induction in the wattmeter circuit where it enters the meter, so as both to reduce and retard the current. By this means, the author holds, rather than by the Arno system, to which he is opposed, the various factors which enter into the problem—the inductor current, the fall of tension, the Joule effect, the losses in the iron, etc.—may be properly handled and a fair method of accounting be made possible. Formulas in support of his conclusions are worked out.—*Revue Générale de l'Electricité*, Jan. 19, 1918.

An Electrical Swindling Scheme To the Editor of ELECTRICAL WORLD:

SIR: The writer recently had occasion to expose the following novel scheme for swindling innocent laymen who were asked to put their money into a new method of greatly increasing the number of lamps lighted from the secondary of a "wonderful" transformer, many more than it was possible to light from the ordinary one. This transformer was said to show that the regular transformers are all wrong in principle, that modern electrical engineers do not understand their true principles, etc.—a kind of statement at which capitalists are apt to bite, swallowing the hook and bait before they find that they have been caught.

The transformer for 110 volts, primary, was inclosed in a box supported on insulators and was provided with only two primary wires leading to the neutral and to one of the outside poles of the switch of a three-wire, 220-volt house

THE DOTTED LINES SHOW THE SECRET CONNECTIONS AND SECOND PRIMARY COIL

circuit; the other outside pole was disconnected and not used. The primary ammeter, wattmeter and voltmeter were connected in this circuit. A similar set of instruments was connected in the secondary circuit, from which a set of lamps was lighted. Any one, including the shrewdest of capitalists, could convince himself from these instruments that the power delivered by the secondary was far greater than that entering the primary circuit. The "secret" was in the transformer, hence it was not open for examination.

A careful examination, however, revealed that there was a small wire, carefully hidden from view, leading from the transformer box through the floor. It was found to be attached to a grounded water pipe, to make it appear innocent; the increased amount of power was supposed to come from this great, big earth, where it would not be missed and would cost nothing. In the cellar, however, there was also another secret and supposedly innocent "ground connection" to the other outside supposedly unused pole of the three-wire, 220-volt system as it entered the building. There was evidently a second primary coil in this secret transformer which was getting its current from the street circuit through these

Readers' Views and Comments

two "innocent" ground connections. This, of course, was not going through the primary measuring instruments. The capitalist who was financing this "great inventor" was very ungrateful to the writer for having pricked the bubble, and the writer later regretted greatly not having asked for payment in advance. This swindling scheme will probably crop up again in the South or West. The writer regrets that he cannot publish the names of both the inventor and his capitalist.

Philadelphia, Pa. CARL HERING.

Daylight Saving

To the Editor of ELECTRICAL WORLD:

SIR: In view of the prospect that some sort of a daylight-saving bill will be passed either by the federal government or by the various states, it is proper that the central-station interests should consider the possible results. One possible result is that this change of the clock would reduce the use of artificial light and thereby save fuel and other expenses. If this is going to be the result, it is very clearly the patriotic duty of the central-station people to encourage the change.

Another possibility, and in my opinion a much greater probability, is that the change in the clock will have no appreciable effect on the use of artificial light. I say this in spite of the reports from England and other countries, as I believe the reduction in the use of artificial light there has been due to the numerous other changes caused by the war, rather than to the change in the clock. However, even under this assumption there is no reason why the central-station people should oppose the change and every reason why they should remain neutral in the matter. There are so many well-meaning people who apparently believe that the change in the clock will change everybody's habits that it will require a considerable effort to make an effective opposition to them. Such opposition would be unpatriotic if these well-meaning people are right, while if they are wrong, they will nevertheless do so little harm that the central stations may wisely confine themselves to a position of neutrality.

The reason why we now get up at 5 o'clock (or 6, or 7, or 8, as the case may be, or even at 9, as we often do on those days when we are at perfect liberty to do as we choose), and the reason why we take our rest at noon, and the reason why we go to bed sometimes with the chickens and sometimes with the owls, is because on the whole these hours really satisfy us best, on account of their relation to the sun. When we make a voyage on an ocean

steamer we can keep exactly the hours we choose, and we match our hours with the sun so as to enjoy or avoid the sun as suits us best. When we go hunting or fishing we match our hours with the hours of the birds or of the fish. In any small town (not a suburb of a large town) the factory hours are fixed to suit the population of that town, so as to give them the daylight they really want. All these hours of our present habits are flexible and are continually being changed either forward or backward.

Now, if we should have a change in the clock, then the next time, as the next spring or the next fall, that the factory hours and schedules are readjusted they will be readjusted to suit the sun, and that means that even if daylight-saving should temporarily result in our getting up a little earlier in relation to the sun or going to bed a little later in relation to the sun, nevertheless every spring and every fall there would be a tendency to shift back so as to make the hours just as convenient in relation to the sun as they were before the daylight-saving plan went into effect, until within a few years our habits in relation to the sun would be exactly as they used to be.

The result of that would be that the man who now gets up at 7 a.m. would under the daylight-saving plan get up at 8, thinking that he had had an hour's more sleep. He would then dine at 8 instead of at 7, thinking he had got an hour's more golf, and would go to bed at 12 instead of at 11, thinking he had had an hour's more recreation in the evening. In order to gain these advantages, however, he would have to adjust his hours so that his rising time, his dining time and his going-to-bed time would be just the same in relation to the sun as they are now; in other words, he would disregard the daylight-saving clock.

The essential point is that the daylight-saving plan does not increase the number of hours in a day, but only tries to shift them. The baseball people and the golf people may think that it is going to give them an hour more, but the hour that they get is taken from their sleep or work.

Therefore, so long as the daylight-saving law is not going to oblige the offices to open at 8:30 a.m. if the management and the employees prefer either 8 or 9 or some other hour, so long as the law is not going to oblige the factories to start work at 7 a.m. if the operatives and the management prefer 6:30 or 7:30 or some other hour, then the whole daylight-saving scheme will be very much like the story of the man whose wife was beating him. An outsider started to interfere, but the man said, "Don't bother; it amuses her and it does not hurt me, so let her keep on."

If it amuses the daylight-saving people to push their law, the central stations should let them keep on and should not bother about the results either way.

R. S. HALE.

Boston, Mass.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities in the Technical, Commercial and Manufacturing Fields

ANNUAL MEETING OF THE ASSOCIATED MANUFACTURERS

Spirit of War to Pervade Gathering on March 21 in
New York—The Industry in Active
War Service

The spirit of war will be dominant in the annual meeting of the Associated Manufacturers of Electrical Supplies at Delmonico's, New York, on Thursday, March 21. War service work for the government, conditions growing out of the war and to be anticipated in the future will be discussed, together with other kindred matters.

At the business meeting to be held at 2:30 o'clock in the afternoon, reports will be presented dealing with international trade conditions of the post-war period, the work of the General War Service Committee of the Electrical Manufacturing Industry and the activities of the association and its sections during the year. Trade acceptances will also be considered. Governors will be elected to take the place of board members whose terms expire.

At the dinner at 7:30 p. m., also at Delmonico's, the war will be in the forefront again. Thus the members will emphasize the fact that, in addition to their enormous output of material for use in the war, a large number of their employees of all ranks are in active service in army and navy.

During the week of the meeting a number of section meetings will be held at the association rooms, including the following:

Monday, March 18.—Interlocking standardization committee, 2 p. m.

Tuesday, March 19.—Snap Switch Section, 10 a. m.; Molded or Formed Insulation Section, 10 a. m.; Socket Section, 2 p. m.; Outlet Box Section, 2 p. m.; Industrial and Street Lighting Fixtures, 2 p. m.; Attachment Plug Section, 4 p. m.; Insulating Materials Section, 4 p. m.

Wednesday, March 20.—Panelboard and Switchboard Section, 10 a. m.; Fuse Section, 10 a. m.; Fan Motor Section, 10:30 a. m.; Knife Switch Section, 2 p. m.; Non-Metallic Conduit Section, 2 p. m.; inclosed externally operated switches, immediately following Knife-Switch Section.

Friday, March 22.—Line Material Section.

SIGNALING APPARATUS SECTION FORMED

In response to an invitation to manufacturers of bells, buzzers, annunciators, fire-alarm and telephone apparatus, signal gongs, etc., a meeting was held in the quarters of the Associated Manufacturers of Electrical Supplies, New York, on Feb. 20, for the purpose of considering the formation of a section.

The following manufacturers were represented: Ansonia Electrical Company, L. F. Anschutz; Edwards & Company, Inc., R. Edwards, Jr.; Holtzer-Cabot Electric Company, M. J. McElevy; Manhattan Electrical Supply Company, E. Whitmore; Patrick & Wilkins Company, E. Ward Wilkins; Stanley & Patterson, George L. Patterson and Albert S. De Veau.

Charles E. Dustin, general secretary of the association, explained the objects and aims of the association and the work being done by the various sections along lines of standardization, co-operation, etc. After an extended discussion it was voted unanimously to form the Signaling Apparatus Section, to embrace in its membership the manufacturers of signal gongs, telephone apparatus, fire-alarm apparatus, annunciators, bells and buzzers and contact devices.

R. Edwards, Jr., Edwards & Company, Inc., was elected permanent secretary of the section, and E. Whitmore, Manhattan Electrical Supply Company, permanent treasurer. George L. Patterson, Stanley & Patterson, has been elected to serve as permanent chairman of the new section.

Lessons to Employees on the Waste of Food and Materials

To impress upon employees evils of waste the management of the Westinghouse Electric & Manufacturing Company has fitted up a storage-battery truck as a traveling exhibit. Upon it is a collection of food wasted, including bread, butter, meat, cakes, crackers, pickles, cheese, fruits, etc., as well as a quantity of manufacturing materials, such as copper, zinc, lead, mica, rubber, felt, gum and similar materials, much of which could be used to considerable advantage.

It is estimated that foodstuffs wasted per day amount to between \$35 and \$50, the cost of which comes out of the pockets of employees. The waste of material amounts to hundreds of dollars per day, which would be a loss to the company if it were not that men are continually sorting the seemingly scrap material and turning it back for use or so that the highest price may be obtained for it from dealers in such material.

This truck was driven up and down the shop aisles so that employees could look upon it.

STREET-LIGHTING CURTAILMENT UNPOPULAR IN NEW ENGLAND

Inquiry by Representative of "Electrical World"
Leads to Belief that Such Attempted Economies
Give Unsatisfactory Results

As a result of the recommendations of James J. Storrow, Fuel Administrator of New England, a substantial cut in street lighting has been on trial in some of the larger cities since the middle of February. The cut was made with the object of saving coal, but the results do not appear to have justified the curtailment. In some cases a moonlight schedule was adopted; in others heavy cuts were made in the "white-way" type of lighting used locally and in regular street-lamp service.

Talks with various central-station officials by a representative of this journal lead directly to the belief that street illumination by ordinary arc or incandescent units offers one of the poorest opportunities in existence to attempt to secure coal economies by curtailment.

EXPERIENCE IN CITY OF BOSTON

In the city of Boston 3200 gas lamps have been cut out, of a total of 9813 single-mantle and 70 double-mantle units. About 1000 magnetite-arc lamps have been cut out, the total of the latter (500 watts rating each) in service Jan. 1 being 5180. Twenty-two Thoran arc lamps have been replaced by magnetites in the public squares, Common and Public Garden. Over 5600 series incandescent lamps were in street service Jan. 1, and none of these has been cut out.

Nothing has been attempted in the city of Boston in the way of running the street lamps on a moonlight schedule. The arc lamps cut out of service in Boston were largely in parks, playgrounds and residential districts in the outlying wards. The general policy followed was to cut out lamps in the middle of street blocks, but to avoid cutting out those on street corners unless the service was duplicated. A total of forty arc lamps was cut out in the Common and Public Garden alone, in the downtown area. Business streets downtown were left almost entirely free from cuts, not a dozen lamps all told being shut down in the business section. Sixty-two white-way or boulevard type of lamps were cut out. The water-front and bridge lamps were untouched.

A good deal of complaint has been received since the shutting off of lamps, and the police authorities have contended in some cases that crimes would not have occurred had the lighting been up to the usual volume. In one particular case where an arc lamp was cut out in front of a store the establishment was twice broken into and it was necessary to replace the lamp.

Just what basis of settlement will be made with the Boston Edison company for these curtailed lamps has not yet been made public. In his letter to the chairmen of local fuel committees, Mr. Storrow pointed out that it is probable that, owing to existing definite contracts for street lighting, utility companies will expect a definite adjustment in remuneration to be made before adopting any restriction in street lighting.

This, Mr. Storrow said, "is of minor importance in comparison to the necessity for fuel conservation at this particular time, and we therefore ask you to use your best efforts to get an immediate curtailment of

street lighting in your district and leave the adjustment of remuneration between the public utilities companies and local authorities to a later period, when it can be satisfactorily worked out."

SPRINGFIELD OPPOSED TO CURTAILMENT

At Springfield, Mass., Mayor Stacy declined to favor street-lighting curtailment, contending that such policy invites danger and tends to lead to increase in crime.

William E. Hodge, deputy superintendent of street lighting, Springfield, informed a representative of the ELECTRICAL WORLD that he was opposed to street-lighting curtailment and was convinced that the saving in fuel so obtained would be merely nominal. Mr. Hodge pointed out that the street-lighting load is for many stations about the only load which is of any value from the standpoint of station efficiency during the small hours of the night, and its cutting off might in some cases affect station economy adversely. The total connected load of the Springfield street-lighting system is only about 1000 kw., and the service is supplied partly from steam-driven plants and partly from hydroelectric plants.

Mr. Hodge also said: "If only 3 per cent of the coal burned in the country, as the ELECTRICAL WORLD states, is consumed by central stations, and only a fractional part of the central-station output is street-lighting load, the saving of coal to be effected by curtailing street lighting is altogether too small to be justified, considering the importance of proper street lighting in community life."

IN CAMBRIDGE, WORCESTER AND SALEM

In Cambridge, Mass., a moonlight schedule was attempted for a time, but it aroused so much opposition on the part of women residents that the lamps were restored. At present all street lamps in Cambridge are operated until 11:15 p. m. only, including the all-night white-way lamps. The midnight white-way lamps are not at present operated.

At Worcester, Mass., all lamps have been put back on the former schedule except the luminous arcs of the white-way type which used to be run until 1 a. m. The luminous-arc system in Worcester comprises 600 lamps, half of which were run 4000 hours yearly and half until 1 a. m. daily. For about six weeks the regular street-lighting system, composed of 400-watt direct-current magnetite-arc lamps and series incandescents, was cut out at midnight. These are now run from dusk to daylight.

No special increase in crime or accidents was noted in Worcester, and the restoration of most of the service as above outlined followed improvement in the delivery of coal to the Worcester Electric Light Company.

Salem, Mass., cut off all its street lighting for a few days early in the year to save coal. The results were bad walking and a serious assault case which aroused public sentiment to the point of demanding the restoration of the lamps. The service was soon restored. In this case the Salem Electric Lighting Company did not credit the city in cash for the lamps cut out, but adopted the plan of burning lamps in future extensions a certain period to offset the hours lost owing to the lamps that were cut out.

Let Us Build Up the Best Machine to Win the War

LOS ANGELES AQUEDUCT POWER TO SAVE OIL CONSUMPTION

California Fuel Administrator Is Advised that
Surplus Power Could Supply Demand Now
Served by Steam Plants

Moves toward economizing fuel consumption were considered at a recent conference in Los Angeles between the Public Service Commissioners and a representative of the California State Fuel Administrator. The chief topic was the diversion of city funds for duplication of the present distributing system to the development of aqueduct water power, this consideration being the result of the Federal Fuel Administrator's recommendation to develop hydroelectric power.

E. F. Scattergood, electrical engineer Aqueduct Power Bureau, reported that of the \$5,000,000 voted for a distributing system nearly half was available. Aqueduct power could be developed to supply all consumers now served by the Los Angeles Gas & Electric Company steam plants. This could be effected within a year, he believed, by completion of Power Plant No. 2 in San Francisquito Canyon and utilizing to the full the capacity at No. 1. This would mean a total of 33,000 hp. added to the present capacity.

The total cost of consolidating the three Los Angeles systems and increasing city generating capacity to a point where it could meet all needs would be about \$1,400,000 at present machinery quotations, but 35 per cent of this could be saved and prompt delivery of machinery assured if government intervention could be secured. Of this total about \$40,000 represented cost of connection with the Los Angeles Gas & Electric Corporation, which could be effected in about a month.

Mr. Scattergood's written report read, in part:

In addition to supplying the 9000 consumers and the street-lighting load connected to municipal lines as well as power requirements under the operating agreement with

the Southern California Edison Company, the city plants have a large surplus capacity. From this surplus the city is now supplying all power used by the Pasadena municipal plant, thus eliminating consumption of approximately 5000 bbl. of fuel oil per month at the Pasadena steam plant. In addition to supplying Pasadena, the city plants have surplus sufficient for practically all of the electric power generated by the Los Angeles Gas & Electric Corporation steam plants for use of electric consumers of that company within the city.

It is understood that the substitution of aqueduct power for that generated by the private company in steam plants would save 45,000 bbls. of oil per month. The private company has offered to purchase the available power from the city or to co-operate in oil conservation in such other manner as the Fuel Administrator may direct.

MONTHLY MEETING OF THE NEW YORK ELECTRIC CLUB

Jobber Has Three Functions in Distributing Goods,
Says F. M. Feiker, in Addressing
the Members

The second monthly meeting of the New York Electric Club was held March 5 at the Hotel Breslin, New York. F. M. Feiker, editorial director of *ELECTRICAL WORLD* and *Electrical Merchandising*, addressed the meeting on "The Place of the Jobber in the Electrical Industry." He stated that the jobber has three functions in distributing goods. First, he carries a stock, in many large houses running as high as 50,000 different items; second, he takes the credit risk, and, third, he creates new business.

J. C. McClernon of the Northwestern Electrical Supply Company is president of the club, and W. J. Krieger, with offices at 47 West Thirty-fourth Street, New York City, is the paid secretary.

CAPITAL ISSUES COMMITTEE ENLISTS STATE COMMISSIONS

War Committee of the Public Service Commissions
Meets Federal Reserve Board Committee
to Co-operate in Conservation

On the invitation of the capital issues committee of the Federal Reserve Board, that committee and its advisory committee held a conference on Feb. 28 in Washington with the war committee representing state public service commissions. There were outlined to the representatives of the public service commissions the aims and purposes of the capital issues committee along the lines of conservation of capital, labor and materials.

The efforts of the committee to bring about curtailment of capital expenditures throughout the country, except where absolutely necessary for prosecution of the war or health and welfare of the community, were stated to the commissioners and received their hearty approval. The commissioners have already accomplished a great deal on these lines and expressed the greatest desire to co-operate in every way possible to subserve national interests during the war.

At an early day a statement of the aims of the capital issues committee will be presented to the commissioners and transmitted by them to the various public service commissions, accompanied by a bulletin recommending nation-wide co-operation and prescribing forms of procedure.

PUSHING THE SALE OF THRIFT STAMPS

Twenty-eight New York Lighting Companies Selling
the Government War Savings Stamps to Em-
ployees and Customers

In their work of promoting the sale of War Savings stamps the New York lighting companies are under the active leadership of Frank W. Smith, vice-president and general manager United Electric Light & Power Company, who is doing effective work in co-operation with the National War Savings Committee appointed by the Secretary of the Treasury. Mr. Smith is chairman of the executive committee of the gas and electric light, heat and power group of the pioneer division. The other members of the committee are F. R. Barnitz, H. M. Edwards, S. H. Giellerup, secretary; L. A. Coleman, director of War Savings Societies; R. B. Grove, director of speakers.

There is also a publicity committee, composed of a representative from each of the companies, as follows: R. W. Allen, F. R. Barnitz, I. M. Beatty, J. I. Blanchfield, J. T. Brown, Jr.; W. L. Bruce, D. Darlington, M. E. Dillon, C. J. Ferdon, M. M. Graham, George Kerr, H. G. Leask, W. F. O'Brien, P. J. Schneider, Henry Schreiner, J. L. Thomas, C. H. Webster, H. L. Wilder, E. S. Young, S. H. Giellerup, chairman.

A number of those who are active in furthering the sale of the stamps through the companies met at a lunch at the Engineers' Club, New York, recently, together with representatives of the New York branch of the national committee. Plans were formulated for reaching all employees and customers. The gas and electric group has been assigned \$1,500,000 of New York's quota of \$100,000,000. In order to sell these stamps it will

be necessary for the twenty-eight companies in the group to dispose of more than \$30,000 worth each week for the rest of the year.

Outdoor signs, posters, collectors and advertising material were among the mediums suggested. The United

Electric Light & Power Company has painted all of its signs with war savings stamps copy. Hundreds of lithographed posters, it was announced, had been distributed and were now prominently displayed at every gas and electric office in Greater New York. The group has prepared a poster asking customers to take their

change in thrift stamps, and this now hangs in front of every cashier's window.

Since the luncheon war savings societies, under the direction of L. A. Coleman, are being established in all the companies so that every one of their 21,000 em-

employees who is able to do so may pledge himself to the purchase of one or more thrift stamps a week. Mass meetings of employees are being held at which short talks are given on the subject of thrift by speakers from the national committee.

Record is kept of the stamps sold by each company and a weekly report is circulated among them so that each may know how the others stand. The Edison Electric Illuminating Company of Brooklyn is in the lead at present, being seventeenth of the companies of all descriptions selling thrift stamps in New York City.

FIGURE FUEL SAVING BY CLOSING PRIVATE PLANTS

J. W. Lieb Estimates Economy of 500,000 Tons in New York District—Fuel Administration in Nation-wide Inquiry

The question of whether, in the interest of the coal conservation, private electric plants should not be closed down and energy obtained from central stations was the subject of a hearing March 4 before the New York Public Service Commission, First District. This step has been advocated by Albert H. Wiggin, State Fuel Administrator, in a letter sent to private-plant owners and operators recently. The United States Fuel Administrator was represented at the hearing by C. E. Stuart, engineer of the conservation division.

Another phase considered was as to whether it would be possible for private plants in business buildings to be shut down during the summer months, when energy could be purchased from the New York Edison or one of the other large electric corporations, but still to be operated during the winter months when the exhaust steam might be used for heating the buildings.

J. W. Lieb, vice-president and general manager New York Edison Company, thought that if all of the 650 private plants in Manhattan and the Bronx were shut down and energy purchased from the electric corporations, it should result in a saving perhaps as high as 38,000, or, conservatively, 500,000, tons of coal per year.

W. F. Wells, vice-president and general manager Edison Electric Illuminating Company of Brooklyn, stated that there were about 570 private plants in Brooklyn divided in various classes. He believed that about 100,000 tons of coal could be saved by using central-station energy.

An announcement of the Fuel Administration, issued in Washington, says in part:

Albert H. Wiggin, Fuel Administrator of New York State, has addressed a letter to the owners of fifty isolated electric generating stations in New York City, calling attention to the necessity of obtaining the greater economy of fuel which will result from the load of these and similar stations being carried by large central stations. Very gratifying replies have been received from many of the owners of such stations.

The hearings of the Public Service Commission will develop the means; also the complications attendant upon effecting a conservation of fuel in this manner. It is desired in no way to bring hardship to the owners of such plants or to the tenants or interests dependent upon such plants.

A nation-wide investigation is now being made on this subject. It has already been demonstrated in many localities that centralization of power may be effected not only without hardship but also with a considerable saving from these angles.

Representatives of the United States Fuel Administration have left Washington for New York to attend a series of hearings before the Public Service Commission of that city at which the general proposition will be discussed of saving coal through the elimination of isolated and non-economical private electric power and heating plants.

According to reports made to the Fuel Administration, millions of tons of coal can be saved and turned to domestic supply and war uses if these plants are closed down in the industrial centers of the country for the period of the war. In addition, the rail and barge trains and cartage problem would be lessened and terminal congestion relieved.

LONDON ELECTRIC COMPANY WILL SUSPEND OPERATION

Unable to Meet Competition of Hydro-Electric Power Commission of Ontario, Private Corporation Will Dismantle Plant

Unable to meet rates of the Hydro-Electric Power Commission of Ontario, Canada, the London Electric Company, Ltd., a corporation controlled by Mackenzie & Mann, will suspend operation.

The London Electric Company has served notice on customers taking approximately 2500 hp. that it will terminate its business in London about March 15. Its plant will be dismantled and scrapped.

The London Electric Company formerly sold power for 9 cents per kilowatt-hour net, plus meter rent. When the Hydro-Electric Commission entered the field it charged 4.5 cents per kilowatt-hour. It gradually reduced charges to 1.5 cents per kilowatt-hour, and the London Electric Company was unable to compete.

When the private company was unable to secure coal for its plant during the recent shortage, directors decided to suspend operation. It is reported that the Ontario government has ordered Mackenzie & Mann to turn over two of its generating machines at Niagara Falls, Ont., to the Hydro-Electric Commission.

War-Saving and Food-Saving Signs in New York City

Electric signs have been donated and are being maintained by the O. J. Gude Company, New York, without charge to the government, for war savings stamps and the Food Administration.

The "W.S.S." sign is on the roof of the fourteen-story Mecca Building, on Forty-eighth Street between Broadway and Seventh Avenue, towering above Longacre Square and showing many blocks down Broadway. The structure is 45 ft. (13.7 m.) high by 107 ft. (32.6 m.) long and the letters are 16 ft. (4.8 m.) high.

The "food" sign is at the northeastern corner of Longacre Square and shows down Broadway toward the Hotel Astor. In the center of the artistic wreath the words "Eat Less Meat" and "Eat Less Wheat" flash alternately. The structure is 33 ft. (10 m.) high and 48 ft. (14.6 m.) long, and the letters are 4 ft. (1.2 m.) high.

NEW JERSEY RATE INCREASE AUTHORIZED BY COMMISSION

Public Service Electric Company of Newark Granted
Higher Schedule to Yield About \$1,000,000
Additional Revenue

As a war emergency measure the New Jersey Board of Public Utility Commissioners has authorized an increase in rates of the Public Service Electric Company, Newark. The higher rates are designed to yield an increased revenue of approximately \$1,000,000 a year.

In acting, the board emphasizes that the advance is solely a war emergency measure and does not affect the reasonableness of the proposed rates in normal times. It also reserves the right to abrogate or modify the new rates should conditions indicated by operating results warrant such action.

The decision allows a war addition to each bill of power consumers of 25 per cent. There is also a surcharge for coal cost.

OTHER INCREASES

Supplementing the announcement of the decision of the Pennsylvania Public Service Commission, published in the issue of the ELECTRICAL WORLD for Feb. 23, 1918, granting higher rates to the Philadelphia Electric Company, it may be stated that the added charge of 10 per cent applies to the entire schedule of light and power rates, with the exception of residence and municipal rates. The increase applies to the railway and railroad rates.

An increase in electric rates of the Wilmington & Philadelphia Traction Company in Wilmington, Del., has been authorized. The domestic rate will be advanced about 1 cent per kilowatt-hour, making it 9½ cents.

DATA ON RETAIL COSTS ARE TO BE CO-ORDINATED

Directors of Society for Electrical Development Vote
to Promote Proper Electrical Merchandising
and Appoint a New Committee

A special meeting of directors of the Society for Electrical Development was held at the offices, New York, on Tuesday, March 5.

The directors present were: President Henry L. Doherty, in the chair; Joseph E. Montague, Gerard Swope, W. E. Robertson, Fred Bissell, Earnest McCleary, James R. Strong, J. Robert Crouse, Charles W. Price, James H. McGraw, represented by F. M. Feiker; J. M. Wakeman, general manager; James Smieton, Jr., secretary-treasurer.

General Manager Wakeman read his report, which was approved and ordered printed for distribution to members.

The committee appointed at the November, 1917, meeting to consider the plan to promote proper electrical merchandising, with James R. Strong as chairman, reported:

Whereas the electrical business is capable of great expansion, and whereas this can be partly accomplished by improving the merchandising abilities and facilities of those engaged in it, and whereas such expansion will be aided by collecting information on the best ways of merchandising and distributing this to members and others engaged in the industry, and whereas in such expansion a

full knowledge of the best methods of proper cost accounting and their application and its broad dissemination is of the utmost importance, it is hereby

Resolved, that the committee recommend to the Board of Directors of the Society for Electrical Development that it take steps to extend the work of the society along these lines.

President Doherty spoke of the possibilities of improving electrical merchandising conditions and expressed sympathy with the idea that such merchandising should be done on a profit-bearing basis.

The report of the committee was accepted and approved.

After considerable discussion, Fred Bissell, Toledo, offered the following resolution:

The general manager to collect information on the best methods of accounting on costs, expenses and earnings in the retail electrical merchandising field, and to arrange this information in a form suited to the needs of the merchants and report to the committee to be appointed by the chair with power to act, and when approved to print and distribute the report to our members.

This was carried unanimously.

The following committee was appointed to receive the report of the general manager as soon as the necessary material has been got together and a tentative plan outlined: Gerard Swope, chairman; H. B. Crouse, J. R. Strong, J. E. Montague, F. M. Feiker.

Encouraging Loyalty and Good Work by Employees

You are at work on a percentage contract, in relation to which the Lord Electric Company is acting as a trustee to safeguard the owner's interests.

In this case the owner is the United States of America, which is spending billions of dollars and is committed to spend millions of lives if necessary, in the cause of Liberty, Honor and Happiness.

Every citizen of this country is expected to "Do his bit." You can do yours by giving us the very best services of which you are capable. Keep yourself fit at all times. Hustle every minute while at work. Report any slacker to your foreman.

Follow these simple rules; then the unit costs of the work will be as low, if not lower, as work on flat contract basis; furthermore, you will uphold the good name of your employer while performing your duty to your country.

LORD ELECTRIC COMPANY

(signed) F. W. Lord,

President.

The notice reproduced herewith is posted by the Lord Electric Company, New York, at places where work is being done by the company for the government. It was received by the ELECTRICAL WORLD from a Washington correspondent.

F. W. Lord, when asked by the ELECTRICAL WORLD whether he cared to make any comment in connection with the publication of the notice, said that the men employed by the company on government contracts were doing fine work and that he believed that the appeal to their loyalty had met with a warm response.

SUPREME COURT DECIDES NEW RETAIL PRICE CASE

Folding that Alleged Price-Fixing Contract Was Contrary to the General Law, Highest Tribunal Follows Previous Rulings

The United States Supreme Court rendered on March a decision holding that contractual notices on patented articles cannot be drawn for the purpose of fixing the retail price. The case was that of the Boston Store, Chicago, against the American Graphophone Company and the Columbia Graphophone Company.

Chief Justice White, in announcing the decision, said in part:

In a general sense the questions involve determining whether the right to make the price maintenance stipulation in the contract stated and the right to enforce it were secured by the patent law and, if not, whether it was valid under the general law and was within the jurisdiction of the court, on the one hand because of its authority to entertain suits under the patent law, or its power on the other to exercise jurisdiction because of diversity of citizenship. We at once say, despite insistence in the argument to the contrary, that we are of the opinion that there is no room for controversy concerning the subjects to which the questions relate, as every doctrine which is required to be decided in answering the questions is now no longer open to dispute as the result of prior decisions of this court, some of which were announced subsequent to the making of the certificate in this case.

Under this situation our duty is limited to stating the results of the previous cases, to briefly noticing the contentions made in argument concerning the non-applicability of those results to the case in hand, and then to applying to the questions the indisputable principles controlling the subjects which the questions concern.

Applying the cases thus reviewed, there can be no doubt that the alleged price-fixing contract disclosed in the certificate was contrary to the general law and void. There can be equally no doubt that the power to make it in derogation of the general law was not within the monopoly conferred by the patent law, and that the attempt to enforce its apparent obligations under the guise of a patent infringement was not embraced within the remedies given for the protection of the rights which the patent law conferred.

It becomes, we think, unnecessary to do more than say that we are of opinion that the attempt in argument to distinguish the cases by the assumption that they rested upon mere question of the form of notice on the patented article or the right to contract solely by reference to such notice is devoid of merit, since the argument disregards the fundamental ground upon which, as we have seen, the decided cases must rest.

BUSINESS RECOMMENDATIONS

FOR USE OF WATER POWER

Report of Special Committee of Chamber of Commerce Is Basis of Questionnaire Sent to 500,000 Business Men

What legislation, if any, might Congress wisely pass for encouraging the development and conservation of the water-power resources of the United States? Would their extensive development, involving such enormous quantities of unused energy, estimated as greater than the total steam power now in service, be industrially practicable? Is it possible, in the case of any enterprise so costly to initiate and so heavily burdened with fixed charges, to outline the essentials of a fair contract which shall protect the interests of the public and at the same time shall make water-power projects sufficiently attractive to capital to secure their develop-

ment? What legislation can be devised for obtaining this result?

That briefly summarizes the question sent out to more than 500,000 business men by the United States Chamber of Commerce for a referendum vote.

COLLECTING WAR DATA FROM ELECTRICAL MANUFACTURERS

Form of General Questionnaire Approved for Confidential Work of General War Service Committee of the Electrical Manufacturing Industry

Rapid progress has been made in the organization of the various groups of electrical manufacturers underlying the General War Service Committee of the Electrical Manufacturing Industry.

The form of questionnaire approved for the group committees states that "the information desired is for the single purpose of assisting the government and will be held absolutely confidential and used in no other way."

The questions follow:

1. Please list here the lines which you manufacture or assemble.
2. Please furnish printed matter descriptive of same, such as catalogs or bulletins.
3. Is your plant 100 per cent in service?
4. Are you doing government work directly or indirectly at present? What percentage of your government work is electrical? What percentage of your government work is in lines other than electrical?
5. Are you desirous of doing government work in your own line?
6. Are you desirous of doing government work in such other lines as your machinery or plant would be capable of?
7. Is your machinery suitable for any other class of work than the type you are accustomed to turning out?
8. What kind of work could you do outside of your regular line?
9. Can you do more work in your own line at present or in the near future?
10. Please give total square feet of floor area occupied at present.
11. Have you room for expansion on short notice?
12. Is your government work displacing commercial work? And to what extent in per cent?
13. How many hours per week constitute full time?
14. Are you running overtime and to what extent?
15. Have you all the labor required for your present business?
16. Could you obtain more labor if it became necessary?
17. Are you having any difficulty in obtaining raw material for government work?
18. Have you room for additional machinery? (square feet)
19. Have you a sufficient stock of raw materials for your present requirements, also for increase?
20. Have you sufficient coal for your requirements?
21. Do you make your own dies, jigs and tools?
22. Do you build any of your own machinery?
23. Can you build machinery?
24. Do you manufacture any materials (so-called non-essentials) which do not directly or indirectly contribute to the assistance of the war emergency?
25. If so, to what extent?
26. What percentage of the so-called non-essentials can be produced without interfering with your maximum production of articles essential in the war emergency?
27. Furnish any other information that you think would be of service to the government.

The questionnaire is varied slightly where necessary to meet the requirements of individual groups.

STREET-LIGHTING RATES ARE REDUCED IN BOSTON

Result of Arbitration Between Edison Electric
Illuminating Company and the City Is a
Lower Price for the Service

Sweeping reductions in Boston street-lighting rates are announced in a decision of the Massachusetts Gas & Electric Light Commission made public on March 2 in the celebrated arbitration case between the city of Boston and the Edison Electric Illuminating Company. The arbitration has extended over more than three years, involving over 10,000 pages of testimony and more than 360 tables and exhibits. It is estimated that the reductions established will save the city about \$600,000 during the life of the contract arbitrated from Nov. 6, 1914, to Nov. 6, 1924.

The arbitration took place as a result of the agreement between the city and the company, which requested the board to investigate and decide whether the street-lighting rates are as a whole fair, taking into account length of term, discount and all other pertinent matters. Under the agreement the commission had no authority to interfere with the contract rates unless it determined that a fair price for the entire service supplied to the city is less than the total amounts to be paid according to the schedule. Therefore the primary question was whether a fair price for the entire service was less than these amounts. The agreement authorized the board in that event to reduce one or more of the rates charged, substituting such rates from the beginning of the agreement for the corresponding rates in Schedule E. The schedule prices per lamp per year and the amounts awarded are as follows:

	Schedule	Board Price
Magnetite arc, 800-cp.	\$87.530	\$79.60
40-cp. incandescent	18.333	15.92
60-cp. incandescent	21.136	17.69
80-cp. incandescent	29.310	22.94
100-cp. incandescent	33.426	29.98

On the agreement date there were 4543 magnetite arcs, twenty-four flaming arcs and 4083 incandescent lamps of 40-cp. to 400-cp. rating, 2910 being of 40-cp. size. Lamps and equipment were supplied by the company at its expense, save certain former gas-lamp posts owned by the city and later used for electric lighting. The agreement provides for extensions of service, relocations of lamps and substitutions of other type lamps, but upon terms designed not to increase thereby the relative cost to the company of supplying service and to compensate the city for any reduction in such cost. Also, the number of lamps of any type required by the city shall not at any time during the agreement, save as streets may be discontinued, be less than 95 per cent of the maximum number of such lamps in service at any time prior to the agreement.

The company computed a cost greatly in excess of the aggregate price for the service expressed in the contract, but the figures were made before close analysis of costs was undertaken in its behalf. The greatest differences in estimated costs of the property involved arose with respect to the distributing system and especially the underground installation.

The aggregate cost to the city of the lamps in service on the date of the agreement was \$479,718.70 per year. The concrete question was whether or not this is a fair price for the entire service. The city con-

ceded the soundness of basing the price upon cost, but re-examined all expense and property items exhibited by the company and challenged many. Comparative summaries follow:

	Company	City
Operating expenses	\$314,013	\$235,986
Taxes	60,593	42,096
Depreciation	42,000	34,622
Return	197,994	96,571
Total	\$614,510	\$309,275

The decision of the commission says in part:

A fair price for the entire service supplied the municipality must in any event take into account such exclusive costs both of investment and operation. But, when it comes to the investment and expenses common to the company's entire system and business, any assignment to the city of a definite share in each item depends primarily on the assumed necessity of making such assignment.

The careful examination of every detail of the company's affairs during these long hearings made it clear that had the company never lighted the streets of Boston there is little, if any, of its plant other than that devoted exclusively to the service with which it could or would have dispensed. Even while the case was pending the growth of the commercial business changed substantially the ratio of the city's demand to the company's peak—a ratio used repeatedly in determining and stating with "illusory inexactness" items of investment and expense attributable to the city. Neither party sought to measure the fair price of the entire service by its cost if independently performed, and both parties recognized the community of interest alluded to in dealing with the generating and transmission expenses.

In view of the terms of the arbitration and for reasons already stated, it seems to the board unnecessary and inexpedient to consider and decide one by one the many issues tried by the parties. Were it to do so, it would at best have reached merely a theoretical estimate of an assumed investment for Boston street lights on the day when the contract became effective, and a finding as to the actual and reasonable costs of and their allocation to the service for the preceding year; whereas the terms of the arbitration call for a determination of "a fair price for the entire service" to be performed under the contract and during its life. Neither has the board deemed it appropriate to discuss in this finding the numerous questions of general policy raised at the hearings. Certain of them directly affected costs and expenses. Others did not find expression in figures, but rather in the assertion of equities favorable to the city.

The evidence disclosed hidden among the legal expenses of the company large payments made for the maintenance of lobbies at the State House and City Hall. Aside from the exclusion of such items, in finding a fair and reasonable cost of the service, the board, in view of its public character and of the paramount duty of seeing that the companies under its supervision in the conduct of their business and the uses and devotion of their resources practice and maintain high civic standards, feels bound to condemn such expenditures as wholly unwarranted and inconsistent with such standards.

Upon the whole, the commission finds that a fair price for the entire service supplied to the city is less than the total amounts to be paid according to Schedule E of the contract and is the sum of \$437,000, and it therefore reduces the so-called running costs per lamp-hour in the following rates charged according to Schedule E, with respect to the following described lamps and with the resulting prices for 3828 hours a year after deducting a discount of 10 per cent:

40-cp. series incandescent lamp from 0.25 to 0.18 cent....	\$15.92
60-cp. series incandescent lamp from 0.30 to 0.20 cent....	17.69
80-cp. series incandescent lamp from 0.40 to 0.30 cent....	22.94
100-cp. series incandescent lamp from 0.50 to 0.40 cent....	29.98
800-cp. series magnetite 500-watt d.c. arc lamp 1.60 to 1.37 cent.	79.60

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

New-Business Meeting of O. E. L. A. Postponed.—This meeting has been postponed from March 6 to March 20 and will be held at Columbus, Ohio.

The Electrical League of Cleveland.—Victor Morgan, editor of the *Cleveland Press*, addressed the Electrical League of Cleveland, March 7, on the subject "Germany To-day."

The Automobile Headlight Problem.—C. A. B. Halvorson talked on this subject at a meeting of the Schenectady Section of the A. I. E. E. on March 1. He discussed the general principles involved in the problem of obtaining adequate and safe headlight illumination for automobiles.

Automatic Substations.—The next meeting of the Pittsburgh Section of the American Institute of Electrical Engineers will be held March 12. R. J. Wensley will deliver a paper on "Automatic Substations." The paper will be illustrated with lantern slides and should be of especial interest to operators of steel mills and electric railways.

North Dakota Society of Engineers.—M. L. Hibbard, manager of the Fargo (N. D.) division of the Northern States Power Company, addressed the North Dakota Society of Engineers Feb. 21, on the subject "Illuminating and Heating." In the course of his talk Manager Hibbard predicted great development in the use of North Dakota's resources of lignite for fuel.

Los Angeles Jovian Electric League.—At the regular luncheon of the league on Feb. 27 U. Oyama, Japanese Consul at Los Angeles, spoke on "Japan." H. W. Doubrava of the Wagner Electric Company was chairman of the day. At the Feb. 23 meeting of the league F. R. Feitshans spoke on "Alaska," touching on its wonderful possibilities for commercial development. Mr. Feitshans has just returned from Alaska, where he was the guest of the Government Railroad Commission.

Anniversary Meeting of Spokane Section of A. I. E. E.—The fifth anniversary of the Spokane Section of the A. I. E. E. was celebrated in Spokane (Wash.) recently by a gathering of forty-five engineers. J. B. Fishken, J. W. Hungate, George Harding and M. W. Birkett were elected delegates to the Spokane Engineer-Technical Association, composed of all engineering chapters having headquarters in Spokane. Details on the distribution of electrical energy by overhead and underground systems were given in addresses by G. H. Hopkins, E. L. Blaine, F. L. Rohrbach, O. O. Coffman and J. G. Finley of Spokane.

Engineers and Architects' Club of Louisville.—A regular meeting of this club was held on Feb. 19, a paper on "Concrete Ships" being presented by J. E. Freeman. The officers elected for the ensuing year are: President, Addison W. Lee; vice-president, L. C. Baird; secretary, Hermann Wischmeyer. The National Bank of Commerce acts as treasurer.

California Joint Convention Plan.—A gathering which is to include the three important electric associations in California is scheduled to be held at Del Monte on April 22-28. The Pacific Coast Electrical Supply Jobbers' Association will convene early in the week and later join with the California Association of Electrical Contractors and Dealers and the Pacific Coast Section, N. E. L. A. One day will be devoted to the discussion of war emergency measures and another day to a discussion of commercial problems. Plans are to be discussed for the formation of a manufacturers' section of the N. E. L. A.

Illinois Contractors Adopt National Organization Plan.—At its annual convention in Chicago Feb. 22 and 23 the Illinois Electrical Contractors' Association went out of existence and was succeeded by a new organization known as the Illinois State Association of Electrical Contractors and Dealers. The new association, which adopted without discussion the form of constitution and by-laws prescribed by the National Association of Electrical Contractors and Dealers, turned over its entire membership of sixty-six and its funds, amounting to about \$400, to the new body. The meeting was notable as the first Illinois contractors' convention at which there were no closed sessions and all branches actively participated. Among those who addressed the meeting were E. M. Craig, secretary of the Associated Building Contractors of Illinois; William L. Goodwin of the General Electric Company, who is the guiding spirit of the trade movement for better merchandising; George B. Foster, assistant to president of the Commonwealth Edison Company; John G. Learned, assistant to vice-president of the Public Service Company of Northern Illinois; George H. Hughes, president of the Edison Electric Appliance Company; A. J. McGivern of the Manhattan Electric Supply Company; Perry R. Boole of the Electric Appliance Company; W. R. Johnson, secretary-treasurer of the Wisconsin Contractor-Dealers' Association, Madison, Wis.; John A. Piepkorn, state secretary of the Wisconsin Contractor-Dealers' Association, and L. A. Schwab of the American Electric Supply Company. Officers for the ensuing year were elected as follows: State chairman, J. A. Weishar of Rock Island; secretary-treasurer, L. B. Van Nuys of Peoria; assistant secretary, G. A. Engelken of Chicago; district chairmen, R. W. Poelma of Chicago, E. F. Pendergast of Rockford, A. J. Hebel of Peru, J. A. Weishar of Rock Island, W. S. Savidge of Macomb, L. B. Van Nuys of Peoria, J. Hughes of Champaign, John Haenig of Springfield and Edgar Rice of Alton.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Faulty Installation.—Maintaining an electric light and power plant transmitting 33,000 volts over wire constructed above a public road without ammeter, circuit breaker or ground detector is negligence little, if any, less than criminal, and the operators must be held to have anticipated severe shock or death from breaking of wire without shutting off the current, the Court of Civil Appeals of Texas held in *Abilene Gas & Electric Company versus Thomas* (1915 W. 1027).

Regulation of Municipal Utilities.—Under the public utilities act providing that no plant owned or operated by a municipality shall be deemed a public utility thereunder, the Public Service Commission cannot regulate water rates where the water system is owned by the city though operated by lessees, it was held by the Supreme Court of Oregon (168 P. 939). Whether it is good or bad policy to exclude water systems owned by cities and operated by lessees from the operation of the public utilities act is not a matter for the courts.

Injuries from Failure to Provide Safety Appliances.—Electric companies are bound to use the highest degree of care practicable to avoid injury to every one in lawful proximity to their wires, including their employees, and to know what safety appliances are suitable and in ordinary use for the protection of employees working in proximity to currents which may prove fatal, the Supreme Court of Pennsylvania held in *Donnelly versus Lehigh Navigation Electric Company* (102 A. 219). When a particular safety appliance has come into general use by others in same line an electric company must furnish its employees with the protection which the appliance affords. Where an electric company fails to furnish an employee with the safety appliances in general use, the employee, having no knowledge of their existence, does not, as a matter of law, assume dangers which would have been obviated by their use, unless they are so apparent and imminent that no reasonable person would risk them; and in such case the employer assumes the risks of the situation. In an action of damages for the death of a lineman engaged in connecting insulated live wires, held, on the evidence, that his assumption of risk of danger from the wires, where he was working without certain safety appliances, was a question for the jury. An employee of an electric company connecting live wires without shutting off the current, as was the practice and custom in such work, and without a safety appliance in general use, was not guilty of contributory negligence.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Lighting of Y. W. C. A. Hostess Houses.—The Judge Advocate General of the army has rendered an opinion that the appropriation for furnishing heat and light for buildings erected at private cost under the act of May 31, 1902, is not available for furnishing heat or light for hostess houses of the Young Women's Christian Association.

Western Association of Electrical Inspectors Memphis Meeting.—The report of the Memphis meeting of the Western Association of Electrical Inspectors published in the *ELECTRICAL WORLD* of Feb. 9, 1918, inadvertently used the words "National Electrical Safety Code," whereas the word "safety" should have been omitted, as the requirements in question are part of the National Electrical Code. The Western Association of Electrical Inspectors indorsed the National Electrical Safety Code and will co-operate in its enforcement during the trial period.

Cleveland Electric Illuminating Company Increases Stock.—The Ohio Secretary of State has authorized the Cleveland Electric Illuminating Company to increase its capital stock from \$15,000,000 to \$18,000,000. Vice-president Robert Lindsay stated that the \$3,000,000 will form a new series of preferred stock drawing dividends not to exceed 4 per cent. The company at present has \$14,000,000 common stock and \$800,000 6 per cent preferred stock, with \$200,000 preferred stock yet unissued. No plans have been made for the sale of the stock.

Facilitating Franco-American Technical Relations.—*La Technique Moderne*, which gives the best known scientific and industrial French reviews, discontinued publication for a time because of the war. Readers of the *ELECTRICAL WORLD* will be interested to know that this journal has resumed publication. Capt. Gustave P. Capart, who visited this country some months ago as a member of the special commission from the French government, writes that M. Painlevé, former president of the Council, sees in the rehabilitation of this publication the means of facilitating technical relations between the United States and France.

Private Interests and Public Rights.—In handing down a decision to the effect that the Cleveland Railway must pay for paving on Superior Street viaduct, and thus sustaining the claims of the city of Cleveland and affirming the decision of the Court of Appeals, Judge R. M. Wanamaker said: "In this day private interests and private rights must yield to the public interests and public rights, and where there is an

ambiguity or uncertainty as to which of two constructions should prevail in a franchise contract it is clear that the construction should be adopted by the courts that would be most favorable to the public interest and welfare."

Cleveland Rate Hearing.—The hearing on the appeal from the Cleveland 3-cent light rate ordinance has been resumed before the Ohio Public Utilities Commission. F. W. Ballard, employed as city expert engineer, declared that cost of production and distribution by the company has decreased steadily. Objections were made to an allowance of a return of 8 per cent on the valuation. The witness said that 7 per cent is considered fair and reasonable in all parts of the country. The company's claim for 3 per cent depreciation on all items was also attacked. Land, Mr. Ballard said, appreciates constantly and no allowance for depreciation should be made on it.

Consolidation of California Properties.—The Southern Sierras Power Company has joined with the Corona Gas & Electric Light Company, the Bishop Light & Power Company, the Rialto Light, Power & Water Company and the Coachella Valley Ice & Electric Company in asking the California Railroad Commission for authority for the last-named four companies to sell their properties to the Southern Sierras corporation. The prices of these properties are: Corona property, \$135,914; Bishop company, \$60,576; Rialto company, \$24,915, and Coachella company, \$821,687. The Southern Sierras company proposes to assume the obligations and pay the difference in cash. The Southern Sierras company is now selling these concerns all the electric energy they use, so that the purchase is the merging of the electricity manufacturing interests with the distribution interests.

Fuel Administrator Urges Water-Power Development.—Prof. D. M. Folsom, Pacific Coast Petroleum Administrator for Mark L. Requa, United States Oil Administrator, has issued a statement to the effect that the total power requirements of the Pacific Coast increase from 10 to 15 per cent per annum. At the present rate of oil consumption (110,000,000 bbl. per year in California) the reserve is not sufficient to supply long the demand, which now considerably exceeds production. At present approximately 20 per cent of the total power utilized on the Pacific Coast is developed from water power, while 70 per cent is obtained from fuel oil and natural gas. Taking into account various angles of the situation, the administrator states: "With the output of oil barely maintained or declining each year this increase must be entirely met through the development of more hydroelectric plants on the Pacific Coast. A conservative estimate of further requirements shows that the installed generating capacity of the plants now on the Pacific Coast should be doubled in five years and tripled in eight years to meet the local requirements for purposes of power, light and heat."

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Denial of Increased Rates in Indiana.—The Indiana Public Service Commission has entered an order in the case of the Clay City Lighting Company, which sought to increase rates. The commission denied the petition, because of the financial showing made.

Incorrect Accounting.—The Indiana Public Service Commission has issued the following warning to utility companies that adopt incorrect methods of accounting: "Frequently a utility will fail to maintain a depreciation fund and while permitting its original property to depreciate will make extensions or additions out of so-called surplus income and then seek to capitalize these extensions and improvements, when the moneys so expended should have been set aside as a depreciation reserve, which legally is not susceptible of capitalization. This practice by utilities of setting up a fictitious book depreciation and ignoring proper depreciation debits against this account can only result in the commission taking such steps as will effectuate a complete and substantial obedience to the specific depreciation provisions of the act. In cases where the practice has continued the commission will naturally, for rate-making purposes, make such deductions from operating expenses as may be found proper and sufficient to cover a reasonable depreciation reserve."

Relief in Rates.—The California Railroad Commission has established new gas rates to be charged by the Western States Gas & Electric Company in its Eureka division. The company asked for only sufficient increase to offset higher cost of oil, materials and labor, and not for any increase in its rate of return. The commission says: "The commission realizes the difficulty under which public utilities are laboring on account of the present abnormally high cost of labor and materials of all kinds and is desirous of affording them such relief as appears to be fair and reasonable under all the circumstances. The utilities, on the other hand, should, of course, not expect the public to bear all the burden of such abnormal conditions, and in the present instance the company, recognizing its obligations in this regard, only asks for enough revenue to cover increased cost of oil and labor and taxes and does not expect any increase in its return on the value of its plant, although the rate of such return which it has hitherto received is considerably less than what might be considered a fair return under normal conditions. The rates herein established are calculated to accomplish approximately the result applied for."

Leroy P. Sawyer, formerly general manager of the Buckeye Electric Division of the National Lamp Works of the General Electric Company, has left to take up special work in the executive department of the National Lamp Works at Cleveland.

T. H. Soren, who became connected with the Hartford Electric Light Company in 1916 as assistant to the vice-president, has been elected vice-president in charge of construction. Prior to going to Hartford Mr. Soren was for twenty-three years with the General Electric Company.

N. A. Boynton has been promoted from publicity manager of the National Lamp Works to general manager of the Buckeye Electric Division of the National Lamp Works, succeeding Leroy P. Sawyer. Mr. Boynton was born in Minneapolis in 1885. His early connec-

and Position—
Biographical Notes

quarters in Salt Lake City, vice-president of the Utah Light & Traction Company and vice-president of the Western Colorado Power Company, has returned to New York and has been elected a vice-president of the Electric Bond & Share Company. In his new position Mr. Groesbeck will have general supervision over the operating department of that company.

W. W. Briggs, who has been general agent of the Great Western Power Company at San Francisco since 1913, has resigned that position to become manager of the New York division of the Westinghouse Lamp Company. Previous to affiliating with the Great Western Company, Mr. Briggs was Pacific Coast manager of the Westinghouse Electric & Manufacturing Company. Mr. Briggs entered the industry in 1886 as a boy in the arc-lamp department of the California Electric Light Company. He was later connected with the Electric Improvement Company and from 1893 to 1896 was electrician for an Idaho mining company. He then joined the sales force of the Fort Wayne Electric Company. In 1899 he entered the sales department of the Westinghouse company and six years later became Pacific Coast manager. In 1911 he was appointed assistant sales manager of the Westinghouse company, with headquarters at San Francisco.

J. Parke Channing was elected chairman of the Engineering Council at the annual meeting held Feb. 21. Mr. Channing was born in New York City and was graduated from Columbia University with the degree of engineer of mines and master of science. Since graduation he has been engaged in mining, in Lake Superior iron and copper mines at first, and afterward in Montana, Utah and Tennessee, more particularly in copper. In 1900 he developed and equipped the Tennessee Copper Company and a few years later built one of the largest sulphuric-acid plants in the world to utilize the waste gases from its copper furnaces. In 1907 he discovered and developed the Miami copper mine in Arizona, now producing copper at the rate of 60,000,000 lb. per annum. He is also engaged in prospecting and developing new mines for the General Development Company. For three years he was president of the Mining and Metallurgical Society of America and is now its vice-president. He is a life member of the Aero Club of America. He was one of the founders of the Lake Superior Mining Institute and is one of its past-presidents. He was directly responsible for the founding of the

Michigan College of Mines. He is a member of the American Institute of Mining Engineers and was one of its vice-presidents for the years 1908-1909. He is vice-president of the Miami Copper Company and of the General Development Company, managing director of the Utah Consolidated Mining Company and director of the Tennessee Copper & Chemical Corporation, the Kerr Lake Mining Company, the South America Gold & Platinum Company and other mining companies.

Obituary

E. W. Stevenson, a well-known cable engineer, was one of the victims of the Florizel disaster. Since the war began Mr. Stevenson had been engaged in supplying the British government with insulated wire and cable and re-

N. A. BOYNTON

tions were with several Chicago printers in publication work and later with J. H. Hoelting, laboratory supplies, and with the Western Electric Company. He later attended the University of Illinois, from which he was graduated in 1909. Since that time he has been connected with the National Lamp Works in the engineering and publicity departments. He has been manager of the publicity department for the last six years.

J. E. North, formerly commercial manager of the Springfield (Ohio) Light, Heat & Power Company, has been appointed secretary of the Springfield Chamber of Commerce. Mr. North has been identified with the Springfield Light, Heat & Power Company for the last eight and one-half years. He started as a salesman for the company and was promoted to the position of commercial manager several years ago. Mr. North entered the electrical field in 1903 with a local traction company and later was appointed electrical engineer of the road. Five years later he joined the force of the Robbins & Myers Company in Springfield and in the following year became connected with the local lighting company.

C. E. Groesbeck, formerly vice-president and general manager of the Utah Power & Light Company, with head-

E. W. STEVENSON

cently more especially with storage batteries. It was on a trip to Newfoundland in connection with British government business that Mr. Stevenson lost his life. Mr. Stevenson, who was of English birth, comes from a family well known in the electrical industry, his father having established a considerable reputation as a submarine cable engineer in England. From 1880 to 1886 Mr. Stevenson was in the employ of the Telegraph Construction & Maintenance Company of London, England, and for two years thereafter was with the Commercial Cable Company. In 1889 he took charge of the cable circuits of the Old Brush Electric Illuminating Company of New York. In the early nineties he was engaged as a consulting engineer for two years and later spent four years as an electrical engineer with the Okonite Company. He left this company in 1899 to become connected with the Hazard Manufacturing Company, which at that time began the manufacture of insulated wire. He continued with that company, of which he was electrical engineer until late in 1913, when he resigned to become sales agent for Messrs. Smith & Nicolls, manufacturers of waxes. He leaves a large family, and his eldest son is a lieutenant in the Aviation Corps.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

JOBGING BUSINESS TOTAL

ESTIMATED AT \$150,000,000

Increase in 1917 Over 1916 30 to 33 per Cent in Value
and Not More than 15 per Cent in Volume
of Merchandise

Estimates on electrical jobbing business in the United States from a source known to be well in touch with the industry all over the country place the annual total at \$150,000,000. The increase in jobbing business in 1917 over the previous year amounted to between 30 and 33 per cent in value as nearly as can be estimated. During the same period the increase in volume of merchandise handled probably did not exceed 15 per cent. The difference, of course, is represented by the increased cost of merchandise. A conservative estimate on the increase in the jobbing business for the last ten years by the same authority is 60 per cent.

LUBRICANTS AND OILS

RAPIDLY ADVANCING

Sale of These Commodities to Public Utilities In-
creases 50 per Cent—Market for Them Is in
Chaotic Condition

The raw material—that is, crude oil—from which the great majority of machine lubricants are derived is not only high but is becoming scarce, refiners say. At least, it is not so easily obtainable as it was even a year ago. With a continually advancing market, the latest increase within a week, 25 cents a barrel, brings crude up to \$4 a barrel for Pennsylvania oil. There has also been an increase of 36 per cent on Southwestern crude. As one of the best known refiners or manufacturers explained the situation to the ELECTRICAL WORLD this week, an abnormal demand on crude stocks has drawn the reserve down rapidly. Last year 30,000,000 bbl. were taken from storage for domestic consumption; 50,000,000 bbl. were exported, 7,000,000 bbl. were imported and placed in storage.

Nevertheless, with apparently heavy stocks in various parts of the country, the danger line of insufficient crude for refining into lubricants and for other commercial purposes is not far off at the present rate of consumption, it is held. For transformer and other oils, which must be of the highest grade, for motors, dynamos, generators, turbines, and in fact all electrical machinery, prices are not only high but are constantly advancing. The last increase occurred two weeks ago, when 10 per cent was added. The supply of wood barrels is growing short, labor is difficult to retain, and the cost of delivery, declare refiners, is another controlling factor in to-day's refined-oil market. Manufacturers report great difficulty in securing proper quantities of oil to fill transformer orders. This situation is mostly due, it was said, to rail embargoes. The government is taking tremendous amounts of crude for fuel oil. In truth, its requirements dominate the oil market; or, as one representative refiner phrased it, oil will win the war. In 1915 crude oil sold at 9 cents. Now it sells for 20 cents, and at least 100 new refineries are under construction. Turbine and transformer oils absorbed at least 10 per cent of the surplus stock of crude oil. There is a comparatively easy market, deliveries are better, and government control would be an advantage. Further, according to the same authority, there has been fully 50 per cent increase in the sale of various fine oils for use by public utilities. Still another lubricant manufacturer stated that there had been from 10 to

50 per cent increase in the demand for electrical machinery oils and that deliveries were too impossible even to talk about.

NOTICE OF PROPOSED

PURCHASES FOR NAVY

Quotations Called for on Miscellaneous Electrical
Supplies for Mare Island Yard—Telephones
for Philadelphia Yard

Bidders desiring to submit proposals for the following electrical material should give the schedule numbers desired and forward same without delay. Applications will be filed as soon as the schedules are received from the public printer. Schedules can be obtained upon application to the navy purchasing office in or near to each navy yard.

Article	Quantity	Navy Yard	Schedule No.

ELECTRICAL EXPORTS FOR THE MONTH OF NOVEMBER

Figures Again Pass Five-Million-Dollar Mark, Bringing
Total for First Eleven Months of Last
Year Almost to \$50,000,000

Figures on electrical exports show shipments from the United States for November last to have amounted to \$5,374,117, in comparison with \$4,421,535 for the corresponding month of 1916. In spite of all the handicaps in export shipping, including government licensing and lack of tonnage, the exports for November last of electrical goods were the second largest in the history of the industry. Wire, cable and wiring supplies reached a total of slightly less than \$1,000,000, while batteries went to more than \$400,000 and motors to more than \$600,000.

For the first eleven months of the year 1917, the total value of electrical exports was \$49,761,700, in comparison with \$35,497,238 for the first eleven months of 1916 and \$22,164,250 for the same period of 1915. From the accompanying table, which has been prepared by the Bureau of Foreign and Domestic Commerce, it will be noted that during the first eleven months of 1917 the exports of every article listed were greater than those for the corresponding period of 1916.

	November		Eleven Months Ended November	
	1916	1917	1916	1917

METAL MARKET SITUATION

Agitation for a Higher Price on Copper—Wire in Active Sale—Tin and Aluminum Scarce

Agitation to secure an increase over 23.50 cents for copper—the established official price up to May 31—is again being commented upon. There seems to be a sufficient supply of the metal to meet all requirements—foreign, governmental and for domestic commercial needs. Wire manufacturers for jobbing and ordinary trade demands are still figuring on a 30-cent base. A lower figure is only quoted for a prospective heavy order. Business in all wire products is very active, especially in large sizes.

Tin is high and scarce with very little Straits to be had at even the high figures quoted. The metal has now been placed by the government with the American Iron and Steel Institute as consignee for all importations.

Orders were issued on Feb. 28 commandeering, for war purposes, all crude and unworked platinum in the hands of importers, jobbers and wholesalers. This step was made imperative by the increasing need for platinum in the production of munitions. The latest quotation on the metal is reported at \$110 an ounce.

Announcement was made Monday by the War Industries Board that President Wilson, after investigation by the Federal Trade Board as to the cost of production, has approved an agreement made with the producers of aluminum fixing a maximum base price of 32 cents a pound at the various American plants and their subsidiaries, subject to revision on June 1; such price to cover lots of 50 tons and over of remelt ingots of a grade 98 to 99 per cent. The differentials now in force for the different grades, quantities and shapes will continue in force for new contracts.

THE WEEK IN TRADE

REPORTS confirm the general impression that each month from the opening of the year records larger sales and increasing values in the volume of business in electrical equipment and staple merchandise. In this respect February goes ahead of January, and it is expected that March will score a still higher mark. The demand for goods, particularly motors and other apparatus, floodlamps, conduit, rubber-covered and weatherproof wire for army cantonments, shipyards and allied industrial enterprises, is exceedingly heavy and is running into millions of dollars. Domestic specialties and appliances, such as refrigerators, sewing machines, washing machines, vacuum cleaners, etc., are moving rapidly. The demand and shortage of lamps is abating. Deferred shipments and rail deliveries are still disturbing elements but are gradually becoming better.

For February collections are reported from fair to the best on record. Credits are being carefully watched and the "loose rein" is not visible in any part of the country.

NEW YORK

With improved weather conditions and a decided relief in shipments and deliveries, trade in electrical goods has bettered greatly. Distributing agencies and jobbing houses are in a stronger position regarding stocks and report larger sales, with a demand for staples in particular. The announcement of the new discounts on heating appliances, published exclusively in last week's ELECTRICAL WORLD, came as a surprise to jobbers, dealers and central stations.

Collections continue to be fairly satisfactory, if not altogether prompt, and vigilance is exercised in the examination of credits.

ELECTRICAL TOYS.—The selling season, which opened Jan. 1 and closes about the end of March, has so far been excellent. As a matter of fact, reports from the leading manufacturers say that the buying of electrical toys exceeds last year's record greatly in volume and value. It appears also that very few new contrivances were brought out as compared with former years. Prices were increased about 5 per cent about the first of the year, and no further advances are expected. Shipments of goods will be made on contract stipulations and, according to trade custom, deliveries will be completed in September. From then to the midwinter holidays the buying will be of the filling-in order.

GEARS AND PINIONS.—Deliveries are about three or four months back, but conditions are slowly improving. Prices are not softening, and manufacturers' sales agents would not be surprised if an advance were made. Raw material is getting easier and the demand is active. In this market several large orders have recently been filled.

DRY BATTERIES.—The supply is referred to as only fair by leading primary distributors and jobbers. No revision of prices has occurred.

HEATING APPLIANCES.—It is evident that a drive is on in the sale of flatirons, toasters, grills, pads and radiators. This applies more especially to prominent department stores, which are having their annual sales this month on these lines.

LAMPS.—A shortage in all sizes is complained of by jobbers. A manufacturer figuring largely in the trade stated shipments had been somewhat delayed, owing to the embargoes and freight congestion. As a matter of fact there was no shrinkage in the actual supply so far as the factory was concerned. Stock in the sectional or local warehouses had been depleted by an unusual drawing upon the reserve. Orders are now being filled and deliveries made

direct from the factory, and consequently it is expected that the apparent shortage will soon be caught up with and disappear.

HOUSEHOLD SPECIALTIES.—Sales on sewing machines, washing machines and vacuum cleaners are running into large volume. The selling campaign inaugurated by the makers and distributors, now in vigorous swing, are having very satisfactory results.

SOCKETS.—Standard and special lines are said to be steady with no change in price or supply.

WIRING FIXTURES.—The market is very uncertain owing to natural conditions, which may brighten under the presence of better weather and improved deliveries.

CONDUIT.—Jobbers report that on some sizes there is a decidedly low stock. Shipments are still held up between Pittsburgh and Eastern territory points. As one distributor explained, owing to the difficulty of getting some sizes of iron conduit a higher charge may be made for immediate delivery. In such cases prices are quoted prior to shipping.

ELECTRIC FANS.—From all accounts it looks as if the sale will be the largest on record. Manufacturers are putting out publicity campaigns for reaching the ultimate consumer, and these efforts are already having their effect upon the trade, which is preparing for a wide public demand in the regular season.

SMALL MOTORS.—Deliveries up to 20 hp. and 30 hp. are more definite, but with no price change.

COLLECTIONS AND CREDITS.—There is no marked change in the status of collections. Jobbers, as a rule, say they are up to a high average mark. Credit men are not relaxing their care in scrutinizing orders on time accommodations. Short terms are the rule.

BRUSHES.—Ceylon graphite, of the best grade, once scarce, on account of the British embargo, is somewhat easier. Deliveries are prompt, going out by express and parcel post.

CHICAGO

Some men of prominence in the trade in Chicago, basing their judgment on the business of the last two months and on the future outlook, see an electrical supply business for 1918 of only 50 to 75 per cent of last year's volume. January with most of the jobbing houses was bad. To weather conditions and heatless days this condition is attributed. In nearly every instance February was better by comparison than January, in spite of the disadvantage under which all firms worked. One house reports that February, 1918, was ahead of February, 1917, but this condition is not general. Optimism as to spring business is general. There have been no changes in prices during the last week. Stocks are in good condition, and no shortage of material in addition to those already existing is foreseen.

The trade for the last week has been greatly concerned with the drive for the war camp recreation fund. The offices of several jobbing houses and manufacturing plants have been personally engaged in soliciting subscriptions from firms in the trade.

CONDUIT.—Deliveries are getting better. Manufacturers are managing to ship some conduit into the city, and this has relieved the jobbing situation.

LINE HARDWARE.—This is the season when jobbers usually stock up on line hardware. Some are buying and some are not. Those who laid in extraordinarily heavy stocks last fall in anticipation of the usual sleet-storm damage have some of it still on hand and are not in the market.

DOMESTIC REFRIGERATORS.—There is activity in this line that indicates some real developments shortly. Manufacturers who have been eminently successful in marketing other electrical goods are viewing the electric refrigerator as a load-building device that can be installed without additional central-station expenditure. A device of this kind that can be sold at a reasonable price has been promised to the trade.

FIXTURE PARTS.—Business in this line, following the slowing up of building activities, is poor.

PORCELAIN INSULATORS.—Standard stock goods are

holding up well, owing to jobber purchases, but a slowing up in the larger goods is noted. Six weeks are quoted on standard stock goods; eight weeks on 33,000-volt goods, and on the larger units longer deliveries are quoted. Practically all of the factories have enough work on hand to keep them busy for six months. No price changes are anticipated.

CEDAR POLES.—Producers are seeking Chicago connections to distribute cedar poles.

BOSTON

Business continues in large volume, although in many lines the total sales are still below those of the early winter. In response to good merchandising methods, increasing sales of heating appliances are reported in retail circles. Prices are firm, with no immediate changes forecast. Collections are a little slower, but the situation is not at all disquieting. Stocks are fairly large in most lines except conduit, heavy wire and large motors. Some improvement begins to be seen in deliveries. The labor situation is better.

Slowly but surely the electric railways bid fair to re-enter the electrical material market, a most encouraging sign being a special message of Governor McCall last week urging higher fares for the Boston system during the period of the war. Maintenance has been sorely neglected of late on many of the electric roads, and manufacturers and jobbers are bound to obtain more business from traction customers this year unless all signs fail.

Electrical manufacturers are suffering from the draft, but vigorous efforts are being made to train employees for increased responsibilities. The relaxation of some of the New England fuel rules this week means longer hours of business and increased consumption of electrical supplies. March will be a full-time and over-time month, and the industrial outlook is far ahead of that of February.

HEATING APPLIANCES.—Retail sales are spotty, but the public seems to be coming into the market more than of late for table appliances. A large Boston department store reports very rapid turnovers in its electrical heating stock, with irons moving fast. A healthy demand exists for percolators, toasters, heating pads and hot plates of small size. As compared with their midwinter attitude, central stations are waking up to the value of appliance business.

LAMPS.—The supply is rapidly increasing. Full-time factory operation is a decided factor in relieving the short stocks here and there reported. The demand for carbon lamps persists, but manufacturers are not encouraging its development and believe it will be short-lived.

MOTORS.—The situation shows little change compared with last week. Smaller sizes are coming more and more into hand, but long deliveries prevail in the larger units. Prices remain steady. Up to 50 hp. deliveries are generally improving and single-phase motors are now in good stock. While stock sheets in general show some gaps, buyers can approach the manufacturer now with greater confidence of being able to secure what is wanted within a reasonable period than for some months. Wooden shipyards are purchasing motors in good volume, but there is a slight lull in army and naval shipbuilding orders at the moment.

AUTOMOBILE SUPPLIES.—With the opening of the annual automobile show at the Mechanics' Building, March 2, a striking increase in interest in electrical supplies for automobiles was seen. Poor railroad service is turning many traveling men to consider car purchases for spring and summer business, and accessory dealers are sure to benefit. Batteries and lamps are very much in the public eye this week.

CONDUIT.—Larger sizes of pipe are still scarce and in great demand by munition plants and other war establishments. Seventy new buildings are being erected at the Watertown (Mass.) Arsenal, and this means a heavy local demand for wiring material and conduit. Delivery difficulties are receiving much thought, and it is believed that the improving railroad situation will show a better movement of pipe before long.

PORCELAIN FITTINGS.—Stocks are very low and railroad embargoes have caused much disquietude. The demand

for heavier wiring service is far beyond the available supply. Prices are holding tight.

FLOODLAMPS.—A fair business is being handled in connection with industrial plant extensions. It is likely that this business will grow somewhat this year as the supply of labor for outside work becomes diverted from one field to another.

ATLANTA

There is very little change in general conditions to record over last week, the undertone remaining strong in all lines. This section is pretty well assured that the government will not fix a price on cotton and this feeling has a tendency to strengthen confidence. Although nothing definite is known with reference to future steel prices, it is not expected that any material change will be made, and, if any, no reduction is looked for. In the face of this uncertainty industrial construction is moving along nicely. Quite a large number of new industrial enterprises have been incorporated in the Southeast this week which will call for considerable electrical equipment. Reports from Washington, D. C., indicate that approximately \$5,000,000 will be expended at Camp Gordon for concentrating troops and supplies and for aviation purposes in Atlanta. Another large hospital is contemplated for Camp Wheeler, Macon, Ga. The erection of fifteen Liberty theaters at various cantonments has stimulated the demand for theatrical appliances. Shipment on this class of equipment has slowed up materially of late. Rumors have been afloat regarding big electrical developments by the large power companies in collaboration with the government. It is expected that more definite information will be available next week.

The dealers state that the advent of springlike weather has increased activity in household appliances. Local stocks are in pretty fair shape to take care of this demand. While residence construction has shown a slump, owing to publicity of the capital issues committee, contracting business is holding up well in the industrial and governmental fields.

INSULATORS.—The demand continues steady and no change in prices or deliveries is noted. In fact, the entire line of pole and line material has registered little change lately, the volume of sales being comparatively heavy.

INDUSTRIAL CONTROL DEVICES.—This line continues very active, especially in motor-starting panels and speed regulators. Drum controllers and resistances for wound-rotor alternating-current motors are also in good demand, but shipment promises are very discouraging.

SEATTLE

Total sales for February were considerably lighter owing to the short month, but the volume for the month averages favorably with January in proportion to the number of business days. Both jobbers and retailers report that the week's business has been maintained at the preceding week's volume. Floodlamps were the prime mover, these going to shipyards and new industrial plants. Sewing machines were the next best seller, the week's sales exceeding last week's slightly. Other domestic appliances are moving satisfactorily, with a noticeable increase in the sales of ranges and flatirons. The full movement of these will not begin for two months or more. Sales to shipyards were as heavy as within the past three weeks. Mill buying is lighter. The volume to cantonments is very light but is expected to increase when construction begins on the additional structures. The freight situation as it applies to local jobbers is no better. Shipments of appliances, conduit, motors, etc., are delayed en route or are waiting at the factories for cars. Shipyard work has not been retarded to any extent, because the concerns have priority certificates entitling them to the best service available.

Oriental freight congestion in Seattle is reduced from 6000 to 4500 cars. Collections for February were the best in years in spite of the short month. Credits are being placed carefully; very few new credits being placed during the month.

At present the housing problem for shipyard workers in Seattle is serious but not critical. If the situation hampers

the government shipbuilding program the United States Shipping Board will use its commandeering power to provide living quarters. During the first two months of the year the building permits issued in Seattle totaled \$710,056, compared with \$265,480 for the same period last year. An additional unit to the five-hundred-thousand-dollar hotel at the American Lake cantonment, at a cost of \$400,000, is announced. A contract was awarded for twelve structures increasing the capacity of the cantonment hospitals, of which the cost will be \$262,000. Absolute control of the spruce industry in Oregon and Washington has been taken over by the government. Beginning March 1, the logging camps and lumber mills of both states established a basic eight-hour day. The British Columbia loggers' association will place an eight-hour day in effect March 11.

It is officially announced that the government stands by the formerly stated plan of adding thousands of skilled mechanics to the Seattle shipyards engaged in government work. The predicted movement will reach a heavy volume early in the summer. The transportation problem in Seattle to the shipyards is being greatly improved. It is assured that the solving of the transportation problem will result in the expansion of many industries and speed up the production of ships and other war necessities. The labor situation is slightly improved, but it is believed a tightening will follow the opening of spring work in the agricultural sections.

The lamp situation is relieved somewhat. Sales will decrease materially with the coming of longer days. Stocks are still low, prices are steady and the present demand is excellent. The motor supply is better, but the demand is less. Stocks are still depleted by recent orders for extensions and betterments in the shipbuilding and industrial field.

SAN FRANCISCO

With all fear of a serious drought past, a note of buoyant optimism pervades the California electrical industry. There is plenty of business, even though a great deal of it lies in channels which have been heretofore practically uncharted. While official February reports have not been tabulated, it is clear that the number of building permits and the total value of the jobs involved fall considerably below the pace set in January. Few hotel and apartment jobs have been recorded, and work on private dwellings is mostly confined to rewiring and small additions. The bulk of the permits issued in San Francisco, which may be taken as a fair example of Pacific Coast conditions, cover industrial buildings.

The past week has seen some very large orders from shipbuilding plants covering big rubber-covered cable, large-sized conduit and condulets, high-amperage motor-starting switches and large fuses. To acquire speed and accuracy a variety of ingenious mechanical devices are used which are motor-driven, hence an unprecedented demand for circular-mill rubber-covered wire which has exhausted the local stocks.

LAMPS.—Deliveries are easier, and lamp salesmen who have been harassed for many weeks past by demands which conditions rendered impossible to fill are now willing to admit that the worst of the situation is past. The volume of orders for the United States government, or for plants engaged in government work, continues at about the same high level, but it is no longer necessary to appeal to the dealers' patriotism and secure their consent to the diverting of their shipments to such plants.

HEATING DEVICES.—Surplus stocks carried over from an indifferent holiday season have cut dealers' purchases to a negligible demand, but a gradual sale of stock on hand, coupled with the usual spring business and the governmental plea for electrical devices, is expected to restore the tone. Many dealers are now soliciting the small heating-device business on a partial-payment scheme. This plan constitutes an innovation.

HOUSEHOLD APPLIANCES.—Although purchases of the smaller electrical household helps are curtailed, it is testimony to the far-sighted economy of a buying public that sales of such devices as washing machines and vacuum cleaners have doubled. Liberal credit terms are given by the electrical jobbers as an encouragement.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

CO₂ Indicator

The Dwight Manufacturing Company of Chicago has added to its line a second form of CO₂ indicator. The use of a mercury column calibrated to indicate directly the percentage of CO₂ is the distinguishing feature. The initial design, which is still retained, used a small spring-type gage for this purpose.

The instrument consists of the usual metal reservoir, a specially calibrated mercury gage and the carrying case for the complete outfit. When in service the reservoir is disconnected from the gage and a sample of flue gas pumped through the chamber. A comparatively large supply of potash solution fills the base, and on the surface of this solution floats a layer of mineral oil, sealing from the chemical the gas sample being collected. When the gas sample has been obtained both valves on top of the instrument are closed and the reservoir is shaken back and forth a few times to break the oil seal and allow the chemical solution to absorb the CO₂ from the gas sample. This "splash system" of mixing the gas and liquid produces rapid absorption of the CO₂ on account of the large surface area of fresh chemical brought in contact with the gas. Connection is then made with the mercury gage, and upon opening the communicating valve the percentage of CO₂ in the gas is indicated on the gage.

Duplex Switch

For controlling two independent lighting circuits from one point, the Bryant Electric Company of Bridgeport has designed a switch that can be used as a substitute for two separate single-pole flush switches requiring a two-gang switch box.

The device consists of two Perkins type "O" push-button switches mounted in a porcelain cup, each switch having its own line and circuit terminals, so that separate feeds for the two circuits can be brought into the switch.

FOR SINGLE-GANG BOX

The switch fits into any shallow single-switch box and takes the standard two-button plate.

This switch is specially advantageous where the public service company has a two-rate schedule. As the switch has

separate feeds, a circuit at each rate can be passed through one box and controlled at the same point.

The new device, which is known as type O, duplex gang switch, No. 2709, is National Electric Code standard and is rated at 10 amp., 125 volts; 5 amp., 250 volts.

Ornamental Lighting Unit

An ornamental lighting unit with the novel feature of an illuminated glass canopy has been added to the General Electric Company's line. This unit differs from most of the ornamental units previously furnished in that the canopy covering the opening in the top of the globe, which permits the removal of the lamp inside, is covered with a glass instead of a metal canopy. This new canopy is made of

EQUIPPED WITH ILLUMINATED GLASS
CANOPY

the same diffusing glass as the globe. It is pointed out that it adds wonderfully to the lamp's appearance, as it shows the outline of the complete fixture when illuminated.

Adapter for Snap Switches

A container or adapter for snap switches, to make them water-tight, is being placed on the market by the Barlow Electrical Specialties Company of Yonkers, N. Y., known as the Youmans water-tight switch box. Into one of these switch boxes the wireman may insert any make of snap switch, either 5-amp. or 10-amp., single-pole or double-pole, three-way or electrolier type. When renewal of the switch becomes

necessary the switch box is filled with a stock snap switch.

The switch box consists of a cast-iron box drilled and tapped for the reception of conduits. Upon this is placed the cover, having the snap switch suspended on a yoke piece, the rubber handle of the snap switch being held by

PROVIDES WATER-TIGHT RECEPTACLE FOR
SWITCH

an insulated clutch on the under side of the cover. This in turn is operated by the knob outside the cover through a conical-valve ground piece seated in the cover, thus avoiding rubber packing around the spindle as in most types of marine or water-tight switches. The cover is brass and is screwed to the box by four corner screws, with a rubber gasket between cover and box.

A round box is also made, 3½ in. (8.9 cm.) in diameter, the cover of which threads on like the cap on a water pipe, no rubber gasket being required. Both the square and round boxes are made in a larger size, adapted to receive any standard 20, 30 or 50-amp. switch. When filled with insulating oil the large round switch box with inclosed switch makes a low-priced oil-break switch especially suited for motor control in factories where no spark is permitted.

Motor-Operated Machine to Finish Cuts

The J. E. Richards Company of Kalamazoo, Mich., has developed a motor-operated machine for standardizing print-shop composing-room operations. The same machine buzz-saws, jig-saws, drills, touts, broaches, notches, undercuts and mortises electros, halftones, etchings, bases, "boilerplate" and lino-type slugs. A swinging-jig saw arm is provided, permitting this part to be swung at right angles with the circular saw to permit material of any length being run through the machine.

The various devices on the table of the machine are belt-driven from a fractional-horsepower motor made by the General Electric Company. Energy is obtained from the lamp socket, and a proper motor is furnished to operate on the energy available.

Portable Electric Drill

A portable electric drill, which is manufactured by Gilfillan Brothers Melting & Refining Company of Los Angeles, Cal., is equipped with gears to give two speeds. These are changed by means of a knob on the bottom of

DRILL HAS TWO SPEEDS

the gear case. The gears themselves are made of chrome-nickel steel and run in grease. Ball bearings are used throughout. A ½-in. (1.27-cm.) standard chuck and a sturdy electric switch are provided. The speed range is 400 r.p.m. on low speed and 700 r.p.m. on high speed. Westinghouse motors are furnished.

Ornamental Lighting Unit

An ornamental lighting unit which diffuses the light with very little absorption and is of great value where low-candlepower lamps can be used, has been developed by the General Electric Company of Schenectady, N. Y. The stippled globe is in three sections, making renewal costs much lower than where a complete globe is used. This fixture can be furnished with or without dome refractor. In both cases there

DIFFUSES LIGHT WITH LITTLE ABSORPTION

is enough light in an upward direction to illuminate the globe for its entire length. It is the only globe of a diffusing nature in which the refractor can be used to good advantage, especially with low-candlepower lamps, be-

cause it does not rob the light source of very much of its initial candlepower. When the refractor is used the lamps are of exceptionally high value for residential street lighting, because it collects all of the upward light and redirects it to the street surface away from the trees. The stippled glass globe is irregular on the inside, so as to split up the light rays and eliminate glare.

Grinder Regulator for Pulp Mills

To maintain a steady maximum output from electrically driven grinders in pulp mills the General Electric Company has developed a regulator which maintains a practically constant load on the grinder motors. The regulator maintains a practically constant load on grinder motors at any predetermined value, so that the current variations are held within such narrow limits that their influence on the electric system is practically negligible. This result is accomplished by automatically regulating the water pressure on the pockets

MAINTAINS MAXIMUM PRODUCTION OF ELECTRICALLY DRIVEN GRINDERS

by means of a motor-operated throttle valve.

The regulator consists of a small induction motor which is connected through series current transformers to the feeder lines of the grinder motor. The rotor of the regulator motor rotates through a small angle and actuates the throttle valve of the main water supply to the grinder, automatically reducing the water pressure when the load on the grinder motor starts to increase and conversely opening the throttle valve and increasing the water pressure to compensate for a falling load.

While this regulating device is simple and strong mechanically, it is also very sensitive to the load changes and smooth in its operation. Actual service tests show that with a single three-pocket grinder, with instantaneous changes in load as great as 33 1/3 per cent, the fluctuations on the driving motor feeder circuit did not exceed 2 per cent.

Variable-Speed Alternating-Current Fans

The Kimble Electric Company, 634 Northwestern Avenue, Chicago, has prepared for the 1918 season a line of variable-speed alternating-current fans. These variable-speed fans will be made

SPEED IS CONTROLLED THROUGH USE OF THE TWO CHAINS

up in sizes ranging from 18 in. to 30 in. (45.7 cm. to 76.2 cm.) in diameter. These fans are reversible and variable in speed from any speed from 100 r.p.m. to maximum speed of the fan.

The entire control of speed is obtained by two chains suspended from the fan, and a slight pull on either chain will either increase the fan speed or decrease it, and maintain it at whatever speed is desired. If the chain is pulled beyond the neutral position the fan will reverse and instantly be converted from an exhaust fan to an intake fan. The fan equipment is built interchangeable from 110 volts to 220 volts. These fans will be equipped with a very small transformer, enabling the use of a low-voltage motor. The custom of using a 110-volt or 220-volt motor, or even higher voltages, has brought about the breakdown of fan motors when working under adverse conditions, such as in kitchens or very dusty atmosphere. For this reason the fans will be fully inclosed, and by using low-voltage motors they will run quietly and will, it is said, be proof against breakdown such as is common with motors of higher voltage.

The fans will be equipped with ball bearings, which will require the minimum of attention and will insure the running of the fans when other bearings have become inoperative because of the accumulation of grease or dust in the oil.

The fans can be built for 25-cycle and 30-cycle circuits, with slight modifications, and maintain the same rate of speed as will be common with the 60-cycle fan. All the fans will be complete units in themselves and will be ready for mounting upon the wall, it being only necessary to run two wires to the fan and no external wiring or regulator wiring being required.

Trade Notes

W. R. OSTRANDER & COMPANY of New York City will represent the Hygrade Lamp Company of Salem, Mass., in the New York and Brooklyn territory.

GEORGE SLESS, who has been stores manager of the Cleveland office of the Western Electric Company, was recently appointed assistant manager of that office.

THE TRIANGLE CONDUIT COMPANY of Brooklyn, N. Y., announces the appointment of Alva D. Stein, 156 Purchase Street, Boston, Mass., as its New England selling agent.

THE LUX MANUFACTURING COMPANY of Hoboken, N. J., announces that it has been awarded the municipal contracts for lamps for both New York City and Chicago for 1918.

W. W. BRIGGS has resigned as general agent of the Great Western Power Company to become manager of the New York division of the Westinghouse Lamp Company, taking effect April 1.

STEPHEN A. STAEGE announces the dissolution of the firm of Staegé & Dewey, and that he will continue in consulting engineering practice, with offices in the Light & Power Building, Watertown, N. Y.

NELSON P. HALL has been appointed district sales manager for the Chicago territory of the Van Dorn & Dutton Company. He was formerly connected with the sales force of the Electric Service Supplies Company of Chicago.

RAYMOND W. MURPHY, who was until recently in charge of the Pacific Coast offices of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has been transferred to the Philadelphia office of the company, where he is assistant manager.

THE ILG ELECTRIC VENTILATING COMPANY of Chicago has purchased 214,282 sq. ft. of property in Chicago, involving the payment of approximately \$128,370, and it is reported that the new factory building which the company will erect on the site will cost more than \$600,000.

J. D. TODD, who until recently was connected with the Western Electric Company at Kansas City, Mo., as assistant sales manager, became associated with the Missouri Valley Electric Company, Jan. 1, as vice-president and manager. Mr. Todd will make his headquarters at Kansas City.

F. H. SMOCK, formerly commercial agent of the Eastern Wisconsin Edison Company, Sheboygan, Wis., has become a salesman with the Bryan-Marsh Division of the National Lamp Works, General Electric Company, in its Southern territory, consisting of Kentucky, Alabama, Tennessee, Mississippi and Louisiana.

THE GREENFIELD TAP & DIE CORPORATION of Greenfield, Mass., opened its new administration building March 5. This event is of more than ordinary importance to the company, as heretofore each plant has maintained its own office and shipping room. Now these functions are centralized in the new building, offering employment to 125 persons in the office alone.

VICTOR R. DESPARD has resigned as manager of the Chicago office of Pass & Seymour, Inc., Solvay, N. Y., to engage in the manufacture of electrical wiring devices, as Despard & Gordon, Inc., with headquarters in Chicago. Mr. Despard is widely known in the electrical industry of the Middle West. He entered the electrical business in 1906 as salesman for the Mohawk Electrical Supply Company and became associated with Pass & Seymour two years later.

SCHWEITZER & CONRAD, INC., of Chicago, Ill., has appointed R. L. Lunt district representative for the northern peninsula of Michigan, the States of Minnesota, North Dakota, South Dakota, the eastern portion of Nebraska, the western portion of Iowa and the northwestern portion of Wisconsin, with offices at Minneapolis and Omaha. The firm has appointed Charles Farnham district representative for the southern part of the State of California, with offices in the L. W. Hellman Building, Los Angeles. Both of these district representatives will handle the entire line of S. & C. high-voltage protective and switching devices.

THE WORTHINGTON PUMP & MACHINERY CORPORATION of New York City announces that the following appointments have been made, effective as of March 1: James E. Sasue, vice-president, in charge of engineering and manufacturing; Leon P. Feustman, vice-president, in charge of general commercial affairs; Frank H. Jones, vice-president, in charge of sales; Edward T. Fishwick, general sales

manager, Charles E. Wilson, assistant general sales manager, William Goodman, assistant to vice-president; William Schwanhauser, chief engineer. The offices of the foregoing will be at 115 Broadway. Neil C. Lamont, works manager, Laidlaw Works, with office at the works, Elmwood Place, Cincinnati.

Trade Publications

MOTOR-STARTING SWITCHES.—The Wells-Morris Manufacturing Company, 90 Second Street, San Francisco, Cal., has prepared a leaflet descriptive of its Wells motor-starting switches, designed for low-voltage and overload protection.

RECEPTACLES.—Pass & Seymour of Solvay, N. Y., have prepared three leaflets descriptive of their P. & S. 60,020 medium-base brass-covered receptacle, P. & S. 299 pull-chain brass splicing link, P. & S. porcelain receptacles and P. & S. sign receptacles.

CONVERSION TABLE.—The American Exporter Translation Bureau, 17 Battery Place, New York City, has prepared a set of conversion tables as follows: Avoirdupois pounds into kilograms, inches into centimeters, feet into meters, miles into kilometers, yards into meters, American gallons into liters, fractions of inches into millimeters, and metrical equivalent of wire gauges.

AMMONIA FITTINGS AND ACCESSORIES.—The De La Vergne Machine Company of New York City has prepared a well-illustrated book descriptive of its ammonia fittings and accessories. Special attention is called to a section which comprises a comparison of various kinds of ammonia fittings, detailed instructions for making soldered joints and some very useful tables.

HEAT INSULATIONS.—The Magnesite Association of America, Philadelphia, Pa., is distributing its anniversary advertising portfolio entitled "85 Per Cent Magnesite" for 1917. It is pointed out that the importance of heat insulation in the conservation of the nation's fuel cannot be overrated. Because of the present scarcity and cost of coal this subject demands more careful consideration than ever before. The Magnesite Association of America was founded to give publicity to the supreme results in heat insulation achieved by "85 per cent magnesite." Accordingly, as a timely contribution to the public consideration of the most efficient form of heat insulation, the Magnesite Association presents this anniversary book of the first year of educational advertising—1917. The exact information given in these advertisements and the wide field of application which they cover are such as to render them of pertinent value and interest to all engineers and architects. The technical value of these advertisements rests primarily on the fact that all the technical statements therein are the result of more than twenty-five years of the most exhaustive engineering experience, and, secondly, on the fact that all the statements regarding the properties of "85 per cent magnesite" are corroborated by the specific endorsement of the Mellon Institute of the University of Pittsburgh.

ELECTRICAL EQUIPMENT IN THE WOODWORKING INDUSTRY.—This is the title of a new circular just issued by the Westinghouse Electric & Manufacturing Company. The publication is profusely illustrated by views of motor-driven wood-working machinery both alone and as installed in representative woodworking plants. Starting with the general subject of motor drive, the reasons for its adoption, such as increased production, better light, greater safety to employees, higher efficiency of machines, more accurate knowledge of cost and greater freedom in power distribution, are explained. The next section is devoted to features of Westinghouse motors which make them suitable for this work, such as rigid construction, sparkless commutation of direct-current machines, and simplicity and reliability of oiling. Assistance which may be rendered to owners of woodworking plants is described. This includes advice as to layout of plant and proper motors to use and prompt repair service in case of breakdown. The woodworking plant of Ferguson Brothers Company, Hoboken, N. J., is described and illustrated in a third section. It manufactures furniture and wooden novelties of various kinds and is completely equipped with motors. The rest of the book gives horsepower requirements and other data for many different sorts of woodworking machinery which will be of much value to those having to do with this class of industrial activity.

New Incorporations

THE DESHLER (NEB.) LIGHT & POWER COMPANY has been chartered with a capital stock of \$100,000 by August F. Kollman and others.

THE MANCHESTER (WIS.) LIGHT & POWER COMPANY has been incorporated with a capital stock of \$3,000 by Gottlieb Pfeiffer and others.

THE WHY ELECTRIC COMPANY of Milwaukee, Wis., has been incorporated with a capital stock of \$15,000 by Albert H. Walker, William F. Horn and Lafayette Yakes.

THE SERVICE ELECTRIC COMPANY of Goshen, Ind., has been incorporated by Herman A. Schmidt, Harvey Miller and George E. Rohrer. The company is capitalized at \$8,000 and proposes to deal in electrical apparatus.

THE J. P. HAND COMPANY of Davenport, Iowa, has been chartered by J. P. Hand, Joseph Lewis and B. Simon. The company is capitalized at \$20,000 and proposes to manufacture automobile parts and storage batteries.

THE COLUMBIA BATTERY COMPANY of South Bend, Ind., has been incorporated with a capital stock of \$10,000 by Otto M. Knoblock, Frank L. Stedman and William B. Starr. The company proposes to manufacture storage batteries.

THE DISPLAY STAGE LIGHTING COMPANY of New York, N. Y., has been incorporated with a capital stock of \$10,000 by John Higham, Michael E. Kelly and William E. Price. The company will manufacture electrical stage apparatus.

THE DUBOIS (IDAHO) LIGHT & POWER COMPANY has been incorporated by C. N. Friday, J. M. Palmer and E. F. Palmer. The company is capitalized at \$25,000 and proposes to supply electricity for lamps and motors in Dubois and vicinity.

THE NATIONAL ELECTRICAL APPLIANCE COMPANY has filed articles of incorporation under the laws of the State of Delaware. The company is capitalized at \$500,000. The incorporators are: C. L. Rimplinger, M. M. Clancy and F. A. Armstrong of Wilmington, Del.

THE OTISCO (N. Y.) LIGHT & POWER COMPANY has been incorporated by Earl T. Harter, Bessie L. Harter of Otisco and Maurice A. Phelps of Syracuse. The company is capitalized at \$10,000 and proposes to generate and distribute electricity for lamps, heaters and motors.

THE CYNTHIANA (KY.) PLUMBING & ELECTRICAL COMPANY has been organized for the purpose of doing a general electrical business, wiring, dealing in electrical supplies and also a general plumbing, heating and gas-fitting business. J. F. Nooe is interested in the company.

THE RUBES ELECTRIC LAMP WORKS of Brooklyn, N. Y., have filed articles of incorporation with a capital stock of \$10,000 for the purpose of manufacturing electric illuminating signals for trains. The incorporators are: Louis Rubes, Augusta Wegman and Nicholas Rubes of New York.

THE INTERCOUNTY ELECTRICAL COMPANY of Sidney, Ohio, has been incorporated with a capital stock of \$100,000 by Edward W. Kelsey, Jr., Charles Weirich, R. O. Holloway, Randolph P. Whitehead and Webb O. Schwenk. The company proposes to take over the municipal electric plant in De Graff and Quincy.

THE C. RAZMERE ACCESSORIES has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$20,000 to deal in electrical supplies of all kinds. The incorporators are: Norman E. John, Edwin J. Hardcastle of Edgemore, Del.; David W. Masters and Catherine G. Masters of Wilmington, Del.

THE DUPLEXALITE CORPORATION of New York, N. Y., has been chartered with a capital stock of \$275,000. The company proposes to manufacture gas and electric-light fixtures. The incorporators are: H. O. Walter, 60 Wall Street; L. C. Bunzl, 121 East Seventy-second Street, New York, N. Y., and L. Roche, Jersey City, N. J.

THE BENJAMIN ELECTRIC MANUFACTURING COMPANY of Chicago, Ill., has been incorporated with a capital stock of \$3,000,000. The company is a consolidation of the Benjamin Electric Company of Chicago and the Royal Enameling & Manufacturing Company of Des Plaines, Ill. The manufacture of electrical specialties and lighting systems will be continued. The plant of the new company will eventually be located on a site of 32 acres in Des Plaines, formerly owned by the Royal Enameling & Manufacturing Company.

New England States

BATH, ME.—The Bath Water District has entered into a contract with the Central Maine Power Company of Augusta and the Bath & Brunswick Light & Power Company to supply electricity for operating the pumping system for a period of three years. This is the first step, it is said, toward supplying the entire system for electrical operation, and eventually to have a storage basin on this side of the Kennebec River, as to do away entirely with the Nesquehoning pumping station and the crossing of the river mains.

CLAREMONT, N. H.—Preparations are being made by the Claremont Power Company for the installation of the necessary equipment in its new substation.

BROOKFIELD, MASS.—The power station of the Worcester & Warren Street Railway Company was practically destroyed by fire on March 4, causing a loss of about \$75,000. The road suspended service Jan. 16 and the power station has not been in use since Dec. 16.

SPRINGFIELD, MASS.—The Gilbert & Barker Manufacturing Company is erecting a large addition to its power house.

BRIDGEPORT, CONN.—Plans have been filed by the Fairbanks Storage Battery Company, 438 Atlantic Street, Stamford, for the construction of a new storage-battery station, 40 ft. by 120 ft., on Fairfield avenue, Bridgeport. Contract for building has been awarded to W. A. Smith & Son, 18 Cannon Street, Bridgeport, at \$20,000.

Middle Atlantic States

BROOKLYN, N. Y.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., for alterations and improvements in the power plant at the Brooklyn Navy Yard to the Child & Scott Company, 112 Webster Street, New York City.

BUFFALO, N. Y.—A resolution has been introduced in the City Council by Commissioner Kreinheder providing for replacing all gas lamps in the city with electric lamps. There are now approximately 9000 gas lamps in use.

CHENANGO FORKS, N. Y.—Bids, it is understood, will soon be asked by the Binghamton Bridge Company, Press Building, Binghamton, for the construction of a power house at Chenango Forks. The equipment will include two 250-kw. water turbine-driven generators. A. L. Gilmore, Press Building, Binghamton, is engineer.

EAST AURORA, N. Y.—The plant and oldings of the East Aurora Electric Light Company are reported to have been purchased by Dr. George Stevenson, for \$50,000. The new owner, it is understood, will make improvements to the service.

LONG ISLAND CITY, N. Y.—The New York & Queens County Railway Company, 44 Jackson Avenue, it is reported, is considering extension to its plant on property recently acquired, consisting of nine and one-half acres at the intersection of the Long Island Railroad and Trotting Lane, Elmhurst.

NEW YORK, N. Y.—An amendment to the fire-alarm rules has been adopted by the Board of Standards and Appeals, permitting the installation of mechanical, non-coded closed circuit or coded closed-circuit fire-alarm signals in five-story factory buildings. The rule recently issued permitted these installations only in buildings up to four stories.

NEW YORK, N. Y.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., for the construction of the United States assay office at New York City, the work to include deep foundations, safety vaults and certain mechanical equipment. Bids will also be received at the same time for the installation of one electric passenger elevator and three electric coin lifts in the United States assay office building, in accordance with drawings and specifications, copies of which may be obtained at the above office.

WAYNE, N. Y.—Three mills at the works of the Wayne Powder Company were recently destroyed by fire, including No. 1 and No. 2 wheel mills and the mixing mill, which was operated by electricity. The loss is estimated at about \$100,000.

BORDENTOWN, N. J.—The Borough Council is considering plans for the installation of a new electric fire-alarm system.

EDGEWOOD, N. J.—Plans have been prepared by the United States government for the erection of a large plant for the manufacture of gas in Edgewood. The cost of the entire project is estimated at about \$37,000,000.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

ELIZABETH, N. J.—Plans have been prepared for the erection of a four-story building, 60 ft. by 300 ft., with a wing to cover an area of 180 ft. by 300 ft., at 810-50 Frelinghuysen Avenue, for the Diehl Manufacturing Company, Trumbull Street.

GLOUCESTER, N. J.—Plans are being considered by the City Council for extensions and improvements to the electric street-lighting system.

HALEDON, N. J.—A movement has been inaugurated for the installation of an electric-light and power plant at the overflow of the borough reservoir at North Haledon. Adolph Branch and Charles Banta are reported to be interested in the project. Haledon has not a post office.

NEWARK, N. J.—The Hay Foundry & Iron Works is building an extension to its plant, and, it is understood, will soon require cranes and machinery for fabricating steel.

NEWARK, N. J.—The construction of a series of power houses between its different shipways, consisting of three plants, between ways Nos. 1 and 2, Nos. 3 and 4, Nos. 5 and 6, respectively, for the Submarine Boat Company, Port Newark, Newark, is under way. The company has nearly completed the erection of two steel fabricating shops.

TRENTON, N. J.—The City Commission has issued instructions to the Public Electric Service Company to keep the electric street-lighting service in operation during darkness only, in order to aid in the conservation of coal. It is also proposed to make extensions and improvements in the lighting system.

ALLENTOWN, PA.—Contract has been awarded to L. M. Kratz & Son, Allentown, by the City Council for alterations and improvements to the power house at the local pumping station, to cost about \$15,000.

BELLEFONTE, PA.—Notice has been filed with the Public Service Commission by the State Centre (Pa.) Electric Company of an issue of \$7,000 in bonds, the proceeds to be used for improvements, etc.

CHESTER, PA.—Contracts have been awarded by the Chester Shipbuilding Company for the construction of five buildings, including a punch and mold shop department, 190 ft. by 500 ft., to cost about \$200,000; extensions to forge and blacksmith shop, \$30,000; new ship carpenter shop, \$30,000; general storehouse, \$30,000, and tank building.

COUDERSPORT, PA.—Notice has been filed by the Home Electric Company with the Public Service Commission of an issue of \$22,000 in bonds, the proceeds to be used for improvements to its plant and system.

ELLWOOD CITY, PA.—The Connoqueness-Lawrence Light & Power Company, recently organized, proposes to supply electricity for lamps and motors in Ellwood City and adjacent territory. The company is capitalized at \$10,000. The incorporators are: J. C. Chesnut, L. B. Round, H. N. Wood, M. Pendleton and C. H. Akins.

INDIAN CREEK, PA.—Plans have been prepared by King & Wightman, 1513 Walnut Street, Philadelphia, for the construction of a new power plant, 30 ft. by 70 ft., for the Mountain Water Supply Company, in Indian Creek.

LEMOYNE, PA.—Extensive improvements are being made to the local plant of the United Electric Company.

NEWPORT, PA.—The Juniata Public Service Company is erecting a new electric transmission line from Montgomery's Ferry to Liverpool, in connection with other improvements to its system.

WILLIAMSPORT, PA.—Plans have been prepared for the construction of a new power house near Rose Street and Erie Avenue for the Lycoming Rubber Company. The Lockwood Greene Company, 93 Federal Street, Mass., is engineer.

BALTIMORE, MD.—Contracts have been awarded by the Bartlett-Hayward Company, Scott and McHenry Streets, to Morrow Brothers, contractors, Fidelity Building, Baltimore, for the erection of a transformer house, about 28 ft. by 49 ft., at Columbia Avenue and Putnam Street; and for a heat-treating plant, 165 ft. by 62 ft., one story. Parker, Thomas & Rice, Union Trust Building, are architects.

ST. HELENA, MD.—Contracts have been awarded by the War Department, Wash-

ington, D. C., for construction of a plant at St. Helena for assembling and repairs of automobiles. A site on Colgate Creek of 100 acres has been acquired. The proposed plant will cost about \$2,500,000, and will consist of about 50 steel and concrete buildings.

FAIRMONT, W. VA.—The Monongahela Valley Traction Company is planning to extend its car lines from Clarksburg to Salem, Philippi and Grafton; from Weston to Orlando and Fairmont to Morgantown. Work involving an expenditure of about \$3,000,000 is contemplated this year by the company.

WHEELING, W. VA.—Plans are being prepared by the Wheeling Traction Company for the reconstruction of its Bay Island carhouse, recently destroyed by fire.

FRONT ROYAL, VA.—The Old Virginia Orchard Company is contemplating extensions to its plant, including the erection of a two-story building 30 ft. by 70 ft., installation of steam water pump, smokestack, electric elevator, and other machinery connected with the canning industry.

RICHMOND, VA.—Contract has been awarded by the War Department, Washington, D. C., to the George A. Fuller Company, Fuller Building, New York, N. Y., for the construction of the aviation concentration camp on Bellwood Farm, near Richmond, to cost between \$3,000,000 and \$4,000,000.

WASHINGTON, D. C.—The Bureau of Yards and Docks, Navy Department, Washington, D. C., has awarded contract for the construction of two temporary office buildings, one for the army and the other for the navy, to the Turner Construction Company of New York, N. Y. The buildings are to be erected on government property, between the Washington Monument and the Lincoln Memorial, south of B Street and west of Seventeenth Street. The cost is estimated at about \$5,750,000.

North Central States

MUSKEGON, MICH.—The proposal to grant the Muskegon Traction & Lighting Company a 30-year franchise will be submitted to the voters at the April election.

AKRON, OHIO.—The Imperial Electric Company of Akron contemplates building an addition, 60 ft. by 100 ft., to its plant.

CINCINNATI, OHIO.—The Automatic Electrical Devices Company of Cincinnati has removed its offices from the Mercantile Library Building to 120 Opera Place, where its new shop will also be located. C. E. Ogden is president and general manager.

CINCINNATI, OHIO.—The Union Gas & Electric Company has petitioned the County Commissioners for permission to erect electric transmission lines along Anderson's Ferry Road, Cleves and Warsaw Pike, Lower River Road, Dugan Gap Road and Geist Road to the Ohio-Indiana state line to furnish electricity in Cleves, North Bend, Adyston and other villages below Cincinnati.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until March 15, for boiler ash hoppers for the division of light and heat. Specifications may be obtained at the office of the division of light and heat.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until March 15 for one two-ton auto truck for the Warrensville Infirmary, department of public welfare. Specifications may be obtained at the department of public welfare.

DEGRAFF, OHIO.—The Intercounty Electric Company, it is reported, has purchased the municipal electric-light plant in Degraff. Electricity to operate the local system will be secured from the Sidney Electric Company.

MARION, OHIO.—Contract, it is reported, has been placed by the Power Manufacturing Company of Marion for the erection of an addition, 82 ft. by 200 ft., one story high, to its plant.

OVERLIN, OHIO.—The high-tension line of the Lorain County Electric Company has been completed as far as Oberlin and is now supplying electricity to operate the local system. The plant of the Oberlin Gas & Electric Company, it is understood, will be closed down.

QUINCY, OHIO.—The municipal electric-light plant, it is reported, has been purchased by the Intercounty Electric Company. The local plant, it is understood, will be closed down, and electricity purchased from the Sidney Electric Company to operate the local system.

SIDNEY, OHIO.—The Intercounty Electric Company, recently incorporated with a capital stock of \$100,000, has purchased the municipal electric-light plants in Quincy and DeGraff. The company will transmit and distribute electricity in Quincy, DeGraff and Emberton and also to farmers along the route. Electricity to operate the system will be purchased from the Sidney Electric Company.

MIDDLESBORO, KY.—At a mass meeting held recently a committee was appointed to look into the matter of securing an electric street-railway service in Middlesboro. It is proposed to extend the car line to the mines to provide transportation to the laborers in that district. J. M. Rogan is chairman of the committee.

PADUCAH, KY.—W. A. Gardner, commissioner of public works, has petitioned the city commissioners for an appropriation of \$40,000 for extension to the municipal electric-light plant, including the erection of an addition to the power house, installation of two 300-hp. boilers, and raising the roof of the plant.

ROXANA, KY.—The Estill Coal Company, it is understood, will install a plant to be equipped for electrical operation this spring. C. H. Trimble of Memphis, Tenn., is interested in the company.

ELWOOD, IND.—The capital stock of the Indiana General Service Company has been increased from \$1,000,000 to \$3,500,000.

MONGO, IND.—Owing to the dam being carried away by the flood the local electric-light and power plant has been put out of commission. It is proposed to purchase a gasoline engine to operate the plant until a new dam is built.

MUNCIE, IND.—The Public Service Commission has authorized the Muncie Electric Light Company to sell its plant and holdings to the Indiana Public Service Company of Aurora for \$1,000,000.

CHICAGO, ILL.—The Public Service Company of Northern Illinois of Chicago has secured the consent of property owners on the "North Shore" of Chicago for a right-of-way for an extension of its electric transmission line between Evanston and Highland Park.

CHICAGO, ILL.—Contract has been awarded by the Inter Ocean Refining Company, 332 South Michigan Avenue, Chicago, Ill., for the construction of an oil refining plant and distributing station near Lyons consisting of a group of tanks, filter house, pump house, stills, boiler house, etc., to the Leonard Construction Company, 332 South Michigan Avenue.

GOOD HOPE, ILL.—The citizens of Good Hope have raised a subscription of \$1,000 to finance a proposed electric-lighting system for the town.

BRODHEAD, WIS.—Plans are being considered for remodeling the municipal electric power station and lighting system. K. Guelson is superintendent.

CAMP DOUGLAS, WIS.—The Orange Light & Power Company expects to increase its hydraulic head and extend its transmission line to the village of Hustler. A. M. Patterson is manager.

MINERAL POINT, WIS.—The Mineral Point Public Service Company has recently completed a transmission line from Dodgeville to Ridgeway and a distribution system in Ridgeway. Energy is supplied to the village of Ridgeway near the city limits of Dodgeville. The erection of a 33,000-volt transmission line from Reway to Platteville is now under way. The new line will connect with the lines of the Interstate Light & Power Company of Galena, Ill., for an interchange of service in case of emergency. John C. Meiners of Milwaukee is president.

SUPERIOR, WIS.—Edward Kaner, who has recently purchased a site in Superior, it is reported, will erect buildings, to be equipped with electrically operated cranes and other machinery.

LANESBORO, MINN.—At an election held recently the proposal to issue \$15,000 in bonds for the installation of an electric-lighting system was carried.

NASHWAUK, MINN.—Preparations are being made by the Water and Light Commission for extensive improvements to the municipal water and light plant. Since the power house was destroyed by fire the department has been handicapped in furnishing an adequate water supply. Orders have been placed for a new electrically driven well pump, to cost approximately \$7,000.

ST. CLOUD, MINN.—Surveys are being made of the contour of the river bed at Pike Rapids, a power site owned by the Pike Rapids Power Company, north of St. Cloud, about 6 miles south of Little Falls.

WACONIA, MINN.—Bids will be received by Joseph Fuchs, clerk of Independent school district No. 44, until March 28, for

the erection of a school building. Separate bids to be submitted on general construction work, heating and plumbing and electric work. Specifications may be seen at the office of Kirby T. Snyder, architect, Minneapolis, Minn., and at the Builders' Exchanges of Minneapolis and St. Paul, Minn.

EDDYVILLE, IOWA.—At an election to be held March 12 the proposal to issue \$8,000 in bonds for improvements to the municipal electric-light plant will be submitted to the voters.

KANSAS CITY, MO.—The Kansas City Light & Power Company has filed an application with the Public Service Commission for permission to increase its capital stock from \$4,977,300 to \$10,000,000.

KANSAS CITY, MO.—Plans are being prepared for the construction of a pumping plant at East Bottoms, a duplicate of the Turkey Creek plant. At the election to be held April 22 the proposal to issue \$1,250,000 for the proposed plant will be submitted to the voters. Burton Lowther is chief engineer.

ST. LOUIS, MO.—Contract has been awarded by the R. E. Burdeau Company, 2921 Locust Street, to the T. J. Ward Construction Company, 1519 Olive Street, St. Louis, for the erection of an automobile showroom, office and garage, 109 ft. by 125 ft., to cost about \$50,000 without mechanical equipment. The plans provide for an electric freight elevator, electric-lighting and steam heat, etc.

NEW ENGLAND, N. D.—The Asby Light & Power Company is contemplating the purchase of a 10-hp. or 100-hp. oil engine; would prefer a good second-hand machine; also a three-phase generator and exciter to go with the generator. The company would like to communicate with dealers and manufacturers in regard to the above equipment. J. A. Meyer is secretary.

BROOKINGS, S. D.—Bids will be received by the Regents of Education of the State of South Dakota, addressed to the president of the State College of Agriculture and Mechanic Arts, Brookings, until March 15 (extension of date from Feb. 15), for the installation of electric wiring in an armory building to be erected at the State College of Agriculture and Mechanic Arts. Plans and specifications are on file in the office of F. H. Ellerbe, architect, St. Paul, Minn., and the secretary, Brookings, and the Builders' Exchanges of St. Paul and Minneapolis, Minn.

BROOKINGS, S. D.—Bids will be received by the Regents of the Board of Education of the State of South Dakota, addressed to secretary of the State College of Agriculture and Mechanic Arts, Brookings, until March 15, for the following work: For electrical wiring in armory building to be erected according to plans and specifications prepared by F. H. Ellerbe, architect, St. Paul, Minn.; for steam heating and electric wiring in addition to administration building, and for electric wiring in stock-judging pavilion, according to plans and specifications prepared by Joseph Schwarz, architect, Sioux Falls, S. D. Plans may be seen at the offices of the architects, Builders' Exchanges, at St. Paul and Minneapolis, and at the office of the secretary of the college, Brookings. I. D. Aldrich is secretary.

NEWARK, S. D.—The local electric-light plant, it is reported, has been purchased by Louis Severson. The new owner, it is understood, will install a new engine in the spring and increase the capacity of the plant.

SCOTLAND, S. D.—The Council has decided to submit the proposal to issue \$35,000 in bonds for the installation of a municipal electric-light plant to the voters.

DAVIS CITY, NEB.—Bids, it is reported, are being taken by the Lincoln (Neb.) Telephone & Telegraph Company for the construction of a telephone exchange in Davis City.

FAIRBURY, NEB.—Plans are being prepared by the Lincoln (Neb.) Telephone & Telegraph Company for the construction of a telephone exchange in Fairbury, to cost about \$12,000.

JUNIATA, NEB.—At an election held recently bonds to the amount of \$6,800 were authorized for the installation of an electric-lighting system. The project includes the erection of an electric transmission line to Hastings.

LINCOLN, NEB.—The Lincoln Telephone & Telegraph Company has petitioned the Nebraska Railroad Commission for permission to increase its capital by \$50,000, the proceeds to be used for extensions to lines.

SIDNEY, NEB.—Bids will be received by the city clerk, Sidney, until March 12, it is reported, for machinery for the municipal electric-light plant and waterworks system as follows: One 250-hp. steam en-

gine, two 200-hp. boilers, one alternating-current generator for direct connection to engine, one steel smokestack, switchboard and instruments, feed-water pumps, and feed-water heater, auto-stokers, coal-handling machinery and enlarging coal bins, etc. Alternate bids will also be received on two 150-hp. internal-combustion oil engines, 10,000-gal. fuel-oil tank.

ATCHISON, KAN.—Contract has been awarded by the Blair Milling Company to the Missouri Valley Bridge & Iron Works of Leavenworth for the construction of a power house, 86 ft. by 102 ft., to cost about \$40,000.

DIGHTON, KAN.—Another election, it is understood, will be called to vote on the proposal to issue bonds for extensions to the municipal electric-light plant and water-works system. The amount (\$10,000) which was at first decided upon will not be sufficient to carry out the proposed plans.

EUREKA, KAN.—Bids will be received by J. W. Kenner, clerk, Eureka, until March 15 (extension of date from Feb. 27) for two 400-gal-per-minute, vertical centrifugal pumps and motors, pumping against a total head of 40 ft.; two 10-ft. by 10-in. gravity mechanical filters and all mechanical filters and necessary equipment; construction of coagulating basins, filter house and clear well. Black & Veatch, Inter-State Building, Kansas City, Mo., are engineers.

HUNTER, KAN.—The installation of an ornamental street-lighting system in Hunter is reported to be under consideration.

LAWRENCE, KAN.—Bids will be received by the Board of Administration, Topeka, Kan., until March 14 for the Administration and Liberal Arts Building at the University of Kansas, Lawrence, including plumbing, electric wiring and steam heating. The cost of the building is estimated at about \$225,000. R. L. Gamble of Topeka is architect.

WICHITA, KAN.—The Public Utilities Commission has granted the Wichita Walnut Valley Interurban Railway Company permission to issue \$1,000,000 in bonds and \$200,000 in capital stock, the proceeds to be used to acquire real estate for rights-of-way, terminal and station purposes and to construct and operate that portion of the line which connects Wichita, El Dorado and Augusta, about 40 miles long. Charles E. Payne is secretary.

Southern States

RALEIGH, N. C.—Bids will be received until March 14 for the installation of an elevator for building to be erected at the State Hospital for Insane. Drawings and specifications may be obtained from Harry Barton, architect, Greensboro. Albert Anderson, Dix Hill, Raleigh, is superintendent.

GREENWOOD, S. C.—Plans are being considered by the owners of the Panola Mill for the installation of street lamps and also for lighting residences.

ATLANTA, GA.—At an election to be held March 25 the proposal to issue \$75,000 in bonds for the installation of an electric generating plant will be submitted to the voters.

SANDERSVILLE, GA.—The City Council is planning to rebuild the municipal electric-light and water plant, recently damaged by fire, causing a loss of about \$10,000.

CHRISTINA, FLA.—The Phosphate Mining Company, it is reported, is planning to rebuild its electric power plant, recently destroyed by fire. P. H. Fuller of Nichols, Fla., is general manager.

DAYTONA, FLA.—The capital stock of the Daytona Public Company has been increased from \$300,000 to \$500,000.

MIAMI, FLA.—The City Council has decided to install arc lamps on Biscayne Drive and Avenue B from Twelfth Street to Buena Vista.

NASHVILLE, TENN.—The Nashville Railway & Light Company will soon begin surveys for an extension of its Gallatin turnpike line to near Hadleys Bend, and also for an extension of the Fairfield line along the Lebanon Road.

SEVIERVILLE, TENN.—The Tennessee Manganese Company is contemplating the installation of a steel furnace (25 tons daily capacity) to convert ore into ferro-manganese at Sevierville. D. C. Campbell of Knoxville is president.

MOBILE, ALA.—The Tennessee Coal, Iron & Railroad Company, it is reported, will construct an electric railway (1½ miles long) to connect with the tracks of the Mobile Light & Railroad Company, to pro-

street-car service to the new Chickaw. Shipbuilding plant. George Gordon Crawford of Birmingham is president.

MOBILE, ALA.—The Mobile & Ohio Railroad Company has awarded contract for the construction of conveyor for grain elevator to Hancock, Harbin & Hancock of Mobile, at \$15,000. The elevator will be equipped with electrically operated machinery and will have a capacity of 250,000 bushels. The elevator machinery will be installed under the direction of the R. C. Fine Engineering Company, Merchants' Exchange Building, St. Louis, Mo.

CORINTH, MISS.—The Supervisors of Corn County have awarded contract to G. Parish, Jackson, Tenn., for the construction of court house, to cost about \$10,000, without mechanical equipment.

CRYSTAL SPRINGS, MISS.—Arrangements have been completed by W. B. Lockwood, representing the town of Crystal Springs, for borrowing \$5,000, authorized by the Legislature for the purpose of installing new equipment in the municipal electric-light plant. The installation of the machinery, it is expected, will soon be completed.

HELENA, ARK.—The capital stock of the Helena Gas & Electric Company has been increased from \$300,000 to \$500,000. The company, it is said, contemplates extensions to its plant and the installation of new equipment.

ROGERS, ARK.—The City Council has adopted a resolution favoring the purchase of the electric plant of the Rogers Light & Power Company to be owned and operated by the municipality.

NEW ORLEANS, LA.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until March 25 for a 10-ton electric traveling derrick crane, installed on existing runways the storage shed at the naval station at New Orleans. Specifications No. 2839 may be obtained on application to the above bureau or to the commandant of the naval station named.

ADA, OKLA.—The Oklahoma Power & Transmission Company, it is reported, contemplates the erection of transmission lines to furnish electricity to all the towns in the surrounding territory.

WATFON, OKLA.—The City Council is considering the question of selling the municipal electric-lighting plant. Owing to the high price of coal and the present charge for service the plant is not self-supporting.

BRISTOW, OKLA.—At an election to be held on March 12 the proposal to issue \$5,000 in bonds, the proceeds to be used for the purchase and improvement of the municipal electric-light plant, will be submitted to the voters.

COLLINSVILLE, OKLA.—The construction of an electric interurban railway from Collinsville to Nowata, Okla., Coffeyville, Kan., and other points is under consideration. D. H. Siggins of Coffeyville, Kan., is reported interested in the project.

HENRYETTA, OKLA.—The Henryetta Ice & Cold Storage Company is installing an ornamental street-lighting system, consisting of 42 standards. J. E. Meaders is purchasing agent.

HOMINY, OKLA.—The Hominy Ice, Light & Power Company has purchased an additional electric generating unit, consisting of a 150-hp. gas engine "Westinghouse," directly connected to a 100-kv. three-phase, 60-cycle, 2300-volt generator, to be delivered about April 1. G. J. Smallwood is secretary.

MCALISTER, OKLA.—The Missouri, Kansas & Texas Railway Company is planning to install a 300-ton mechanical chute at McAlester. F. Ringer of Dallas is chief engineer.

PRAGUE, OKLA.—The City Council has decided to call an election to submit the proposal to issue \$45,000 in bonds for improvements to the municipal electric-light and water-works system to the voters.

AUSTIN, TEX.—Plans are being prepared for the erection of a new telephone exchange building for the local telephone company.

GRANBURY, TEX.—The Granbury Cotton Oil Company, it is reported, is contemplating the purchase of a new or second-hand 150-hp. crude-oil engine, either direct-connected or belted to generator; also a 10-hp. to 300-hp. crude-oil engine, either belted or direct-connected type.

LOMETA, TEX.—F. C. Whittmire, it is reported, is planning to rebuild the local electric-light plant, recently destroyed by fire, causing a loss of about \$5,000.

McKINNEY, TEX.—The local electric plant of the Texas Light & Power Company was partially destroyed by fire recently, causing a loss of about \$8,000.

Pacific and Mountain States

CHEHALIS, WASH.—The Central Light & Manufacturing Company of Chehalis has filed a petition with the Commissioners of Lewis County asking for a franchise to construct and operate an electric transmission line from Walville at the Lewis-Pacific county line to Meskill, 12 miles west of Chehalis. If the franchise is granted, it is understood that the western Lewis County towns will be supplied with electricity from the transmission lines of the North Coast Power Company operating in this section.

TACOMA, WASH.—At the municipal election to be held April 2 the proposal to issue \$6,500,000 in bonds for the acquisition by condemnation or stipulation of the entire street railway system of the Tacoma Railway & Power Company will be submitted to the voters.

TACOMA, WASH.—A permit has been granted for the installation of underground conduits from the Nisqually substation at Twenty-third and C Streets to Winthrop Avenue. The new circuits (which will be the first underground conduits in Tacoma) will supply energy for the shipyards and the tideflats.

GARDINER, ORE.—Steps have been taken by Warren Reed of Gardiner and James R. Wheeler and Arthur Blanchard of Marshfield to organize a new electric company to be known as the Umpqua Power Company. The new company will take over the property of the Gardiner Light & Power Company and will furnish electrical service in this city and Reedsport, now without service.

FRESNO, CAL.—The Copper Mine substation of the San Joaquin Light & Power Company was recently destroyed by fire, causing a loss of about \$3,000.

REDDING, CAL.—At the annual election to be held April 8 the proposal to issue \$40,000 in bonds to build or acquire a municipal electric-light plant will be submitted to the voters.

BOISE, IDAHO.—The City Council is considering the installation of a new street-lighting system.

BOWIE, ARIZ.—The Southern Pacific Company has appropriated \$20,000 for remodeling its depot in Bowie and is also contemplating the installation of a power plant here.

BILLINGS, MONT.—The City Council has authorized the city clerk to call for bids for installing street lamps in special lighting district No. 3.

GREAT FALLS, MONT.—Work will start immediately by the Anaconda Copper Mining Company on the construction of a plant at the Boston & Montana Works at Great Falls for the electrolytic production of ferro-manganese. Five furnaces will be installed each with a daily capacity of 250 tons. Electric power will be supplied by the Montana Power Company.

DEMING, N. M.—Extensions and improvements involving an expenditure of at least \$300,000 will be made at Camp Cody, Deming. The proposed work will include another electric power plant of 185 hp., new headquarters building for nurses, new headquarters building for officers, operating pavilion, new hospital for treatment of eye, ear, nose and throat affections, new barracks, an inclined railway, another 100,000-gal. tank, etc.

Canada

FORT SASKATCHEWAN, ALTA.—Orders have been placed for equipment for the municipal electric-light plant, including one 125-hp. open-feed water heater, one steam main, consisting of 3-in. pipe, two non-return valves pipe bends and flangers. One boiler-tube rattler, one Lennox drive and one small motor-driven centrifugal vertical pump may possibly be purchased. E. Barnott is general superintendent.

NELSON, B. C.—Preliminary plans are being prepared by the Consolidated Mining & Smelting Company of Trail, B. C., for the construction of a concentrator plant in Nelson.

WOODSTOCK, N. B.—The Woodstock Electric Railway, Light & Power Company is contemplating improvements to its plant this summer, including the installation of a Hercules turbine type D of the Holyoke Manufacturing Company, developing 137½ hp. at 13 ft. head, belt-connected to a Westinghouse generator in synchronism with two other generators. A. Gordon Bailey is secretary and treasurer.

DARTMOUTH, N. S.—Tenders will soon be asked for electrical work for the new plant of the Canadian Carbonate Company, 132 Hollis Street, Halifax.

HALIFAX, N. S.—Tenders are being re-

ceived by Bate, McMahon & Company, Sparks Street, Ottawa, and Halifax Hotel, Halifax, for electrical work for the military huts for the Department of Public Works, Dominion Government.

SHELBURNE, N. S.—Frank J. Carter of Dartmouth, it is reported, is planning to erect and operate a cold-storage warehouse at Shelburne, to cost not less than \$40,000.

HAMILTON, ONT.—The rebuilding of the Central Market and the installation of a new refrigerating system, to cost about \$100,000, is under consideration by the City Council. E. R. Gray is city engineer.

LONDON, ONT.—The Public Utilities Commission is considering the purchase of two electrically-driven pumps, with a capacity of 600 gal. per minute, for the water works system. Philip Pocock is chairman.

LYNDHURST, ONT.—Improvements are contemplated to the local electric-light plant, owned by George E. Roddick, this coming summer, including the installation of 200-hp. waterwheels for the purpose of supplying electricity for lamps and motors to farmers and residents in the vicinity of Lyndhurst. It is also proposed to erect electric transmission lines (4 miles) through Oak Leaf and to connect up Suleys Bay.

SMITH'S FALLS, ONT.—The city of Smith's Falls has taken over the properties of the Citizens' Gas & Electric Company and the Smith's Falls Electric Power Company. Although the two plants are operating separately as yet, the intention is to reconstruct and unify the local distribution systems as speedily as possible and to operate them in parallel with the supply obtained from Merriekville through the transmission line of the Hydro-Electric Power Commission of Ontario. H. F. Shearer is manager.

STOUFFVILLE, ONT.—Plans are being considered to change the municipal electric-light plant from steam power to producer-gas fuel. R. O. Ward is superintendent.

TORONTO, ONT.—A permit has been granted to the Dominion Shipbuilding Company to erect a workshop and general machine plant at the foot of Bathurst Street, to cost about \$175,000.

UXBRIDGE, ONT.—Arrangements are being made by J. W. Gould, owner of the local electric-light plant, for the installation of a 70-kva. Bullock three-phase, 2300-volt generator this spring. Equipment has already been purchased.

WATERLOO, ONT.—The Waterloo Water and Light Commission is contemplating the installation of a regulator. C. W. Schiedle is secretary and manager.

ST. NARCISSE, QUE.—The North Shore Power Company, Power Building, Three Rivers, it is reported, will build a dam, to cost about \$15,000, at St. Narcisse.

SHERBROOKE, QUE.—The city of Sherbrooke is now installing in the Weedon plant (30 miles from Sherbrooke) a 1300-kva. generator and a 2000-kva. three-phase 2400/50,000-volt transformer, and is also building a general distributing station in Sherbrooke to receive power from all generating stations. Charles Desbaillets is manager and engineer.

MOOSE JAW, SASK.—Improvements are contemplated to the municipal electric-light plant this year, including the installation of an ash-handling plant, circulating pump and vacuum pump, steam-flow meters, CO₂ recorders, etc. J. D. Peters is manager.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until March 23 for generator sets, switchboards, copper cable, end bells, transformers, connectors, terminals, receptacles, copper rod, busbar supports, pipe fittings and floor flanges. Blanks and information pertaining to this circular (No. 1203) may be obtained at the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until March 27 for steel, iron or steel pipe, steel and copper cable, duplex and ignition cable, bronze copper, phosphor tin, motor-generator sets, transformers, starting compensator, end bells, busbar supports, electrical switches, split-T connectors, cable clips, speaking-tube mouthpieces, etc. Blanks and information relating to this circular (No. 1205) may be obtained at the above office or at the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

(Issued Feb. 5, 1918.)

- 1,255,597. INDUSTRIAL ELECTRICAL CAPACITY BATTERY; George Giles, Friburg, Switzerland. App. filed Oct. 16, 1916. Improvements.
- 1,255,598. SWITCH MACHINE; Gardner B. Gray, Pittsburgh, Pa. App. filed Feb. 5, 1916. Composed of two units.
- 1,255,607. DYNAMO-ELECTRIC MACHINE; William T. Hensley, Connorsville, Ind. App. filed June 8, 1912. Involving the use of sheet metal in the manufacture of generators and motors.
- 1,255,613. ELECTRIC FURNACE-CONTROL APPARATUS; Alvin D. Keene, Schenectady,

1,256,006—Secondary or Storage Battery

- N. Y. App. filed Sept. 5, 1917. Electrodes may be automatically moved into contact with a stationary conductor at the beginning of the furnace operation to strike the arcs.
- 1,255,637. ADJUSTABLE SPARK GAP; Albert E. Reade, Petersburg, Va. App. filed June 8, 1916. Mounted upon the outer end of a spark plug so that the spark plate, being carried upon the insulating strip, may be held in an adjusted position.
- 1,255,639. CHANDELIER CLUSTER HOOK; Alfred W. Keiser, Toledo, Ohio. App. filed July 27, 1917. Will greatly facilitate the installation of fixtures.
- 1,255,646. MAGNETIC AERIAL APPARATUS; Patrick J. Ruddy, Centralia, Pa. App. filed Feb. 24, 1916. Aerial telephone in which magnets are utilized to cause high oscillating currents and reproduce and magnify similar vibrations in the air and earth so that sounds may be received and sent.
- 1,255,651. COUPLER FOR MUSICAL INSTRUMENTS; Melvin L. Severy, Arlington Heights, Mass. App. filed March 31, 1913. Improvements.
- 1,255,667. HIGH-POTENTIAL INSULATOR; Elihu Thomson, Swampscott, Mass. App. filed Jan. 9, 1913. Utilizing the principle of the non-conducting and insulating character of a very high vacuum.
- 1,255,681. COMMUTATOR; Charles C. Zenk, Wilkesburg, Pa. App. filed July 8, 1912. Improvements.
- 1,255,712. ARMATURE-WINDING MACHINE; Newton Crane, Boston, Mass. App. filed June 3, 1914. Improvements.
- 1,255,713. ELECTRIC REGULATOR; John L. Creveling, New York, N. Y. App. filed March 16, 1910. Improvements.
- 1,255,721. SYNCHRONOUS ELECTRIC MOTOR; James K. Elderkin, Jr., Newark, N. J. App. filed Feb. 17, 1916. Improvements.
- 1,255,724. AUTOMOBILE; Roland S. Fend, Chicago, Ill. App. filed May 5, 1915. In which an internal-combustion engine and an electric motor and storage battery co-operate to form the prime mover for the vehicle.
- 1,255,771. ELECTRIC WAFFLE STOVE; Joseva Miller, Pasadena, Cal. App. filed Nov. 8, 1915. Improvements.
- 1,255,774. SWIVEL CONNECTION; Lambert H. Moulthrop, Philadelphia, Pa. App. filed Dec. 8, 1915. May be adjusted either to connect such parts movably so as to permit their relative rotation or to clamp them immovably together.
- 1,255,795. IGNITION TIMER; Ralph V. Sawyer, Sedalia, Mo. App. filed July 5, 1917. For regulating the time of the operation of the sparking plug.
- 1,255,814. ELECTRIC HEATER; Edmund N. Brown, San Francisco, Cal. App. filed Dec. 26, 1917. Improvements.
- 1,255,824. INSULATED TESTING-PLUG TERMINAL; San Francisco, Cal. App. filed Aug. 13, 1917. Adapted to be attached to the conducting cords connected to indicating or testing instruments.
- 1,255,838. DYNAMO-ELECTRIC MACHINERY; Rudolf Knoll, Enner-Baden, Switzerland. App. filed March 20, 1916. Relates to unipolar or homopolar dynamo-electric machines.

Record of Electrical Patents

Notes on United States Patents

- 1,255,840. ELECTRIC RADIATOR; Richard G. Ledig, Philadelphia, Pa. App. filed Aug. 7, 1917. Heat waves generated by a resistance coil are directed by means of polished metal reflector.

(Issued Feb. 12, 1918.)

- 1,255,846. CIRCUIT-MAKE-AND-BREAK DEVICE; Walter D. Appel, Cleveland Heights Village, Ohio. App. filed Feb. 11, 1916. In connection with the electric ignition circuits of internal-combustion engines.
- 1,255,853. MEANS FOR LOCATING FAULTS ON ALTERNATING-CURRENT CIRCUITS; Karl H. Bausman, Dayton, Ohio. App. filed Feb. 7, 1917. Exploring coils.
- 1,255,861. DAMPING MATERIALS FOR TELEPHONES; Irving B. Crandall, New York, N. Y. App. filed Aug. 14, 1916. Of vibrating members.
- 1,255,863. OUTLET BOX OR FIXTURE; Lionel W. Compton and Earle N. Oliver, Tampa, Fla. App. filed May 1, 1915. For facilitating the connection and support of electric conductors or for supporting a chandelier or the like.
- 1,255,866. SIGNAL SYSTEM FOR ELEVATORS; Edward L. Dunn, Worcester, Mass. App. filed Nov. 13, 1913. For use in department stores.
- 1,255,874. MOTOR-CONTROL SYSTEM; Maurice M. Goldenstein, Milwaukee, Wis. App. filed Feb. 26, 1917. Relates to multi-unit printing presses and similar mechanisms.
- 1,255,887. ELECTRIC SWITCH; Charles J. Klein, Milwaukee, Wis. App. filed June 3, 1911. Multi-circuit.
- 1,255,895. ELECTRIC VIBRATOR MASSAGE MACHINE; William J. A. Kuehl, Chicago, Ill. App. filed March 2, 1917. Improvements.
- 1,255,905. ELECTRIC CLOCK; Edwin H. Messter, Brooklyn, N. Y. App. filed Dec. 5, 1914. Avoids the use of weights, springs and complicated gearing and operates with very small friction losses and wear.
- 1,255,943. ELECTRICAL CONNECTOR; Parke T. Snyder, Chicago, Ill. App. filed Aug. 14, 1916. Socket for receiving either a single or double contact Edison-Swan plug or lamp base.
- 1,255,947. TRANSFORMER AND LIKE COILS; Chester H. Thordarson, Chicago, Ill. App. filed Dec. 8, 1913. Provides means for maintaining the elements of the coil structure in proper position with relation to each other and to the insulation interposed between the elements.
- 1,255,948. COIL STRUCTURE FOR TRANSFORMERS AND THE LIKE; Chester H. Thordarson, Chicago, Ill. App. filed July 10, 1915. Novel winding-coil structure of the pancake or disk type.
- 1,255,959. SIGNAL; Frank T. Vanatta, Mill Valley, Cal. App. filed March 15, 1916. For use at grade crossings of railways.
- 1,255,964. TELEPHONE-EXCHANGE SYSTEM; Harry G. Webster, Chicago, Ill. App. filed May 20, 1914. Applied particularly to such apparatus in connection with instruction circuits of telephone-exchange systems.
- 1,255,968. TIME CONTROLLING AND RECORDING MECHANISM; Walter Williamson, Everett, Mass. App. filed April 2, 1915. Particularly for use with a steam-whistle valve.
- 1,255,998. WINDMILL GENERATOR SET; Fred J. Fahle, Luckey, Ohio. App. filed July 22, 1915. The wheel of the mill moves at substantially a constant speed when the circuit of the generator is completed.
- 1,256,003. SANITARY ATTACHMENT FOR TELEPHONE TRANSMITTERS; Maries S. Federman, New York, N. Y. App. filed Feb. 19, 1917. Pad treated with an antiseptic solution.
- 1,256,006. SECONDARY OR STORAGE BATTERY; Bruce Ford, Philadelphia, Pa. App. filed Dec. 22, 1916. Retaining the gasket employed to seal the terminal post to cell cover.
- 1,256,043. RENEWABLE CARTRIDGE FUSE; Emerich Sabina and Lester I. Cope, Sharpsburg, Pa. App. filed Oct. 29, 1915. Can be renewed without the use of tools.
- 1,256,063. ALTERNATING-CURRENT RECTIFIER; Howard A. Selah, Newark, N. J. App. filed March 29, 1915. Improvements.

- 1,256,066. FUSIBLE SERVICE PROTECTOR; Christopher H. Shoebridge, New York, N. Y. App. filed Dec. 15, 1915. Improvements.
- 1,256,067. ELECTROLYTIC APPARATUS; Harry T. Shriver, West Orange, N. J. App. filed Jan. 20, 1916. Improvements.
- 1,256,087. TELEPHONE-EXCHANGE SYSTEM; Samuel B. Williams, Jr., and Edgar I. Clark, New York, N. Y. App. filed March 21, 1917. Improved organization for automatically controlling the distribution of calls in a telephone-call distribution system.
- 1,256,098. SIGNALING DEVICE; Berthold A. Baer, Philadelphia, Pa. App. filed Apr. 6, 1915. For use with moving vehicle.
- 1,256,123. TELEPHONE APPARATUS; George I. Galitzka, New York, N. Y. App. filed March 14, 1917. Adapted to notify and warn the subscriber that the local switchboard operator's set is connected in the line and the local operator is therefore able to listen in.
- 1,256,125. MASTER CONTROL AND LOCK FOR ELECTRIC CIRCUITS IN AUTOMOBILES; Leon Goldmerstein, New York, N. Y. App. filed Dec. 4, 1915. Improvements.
- 1,256,126. AUTOMATIC TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodman, New York, N. Y. App. filed May 25, 1916. Means for segregating a desired class of calls.

Volume 71

New York, Saturday, March 16, 1918

Number 11

The Coal Pile Will Bear Continued Watching

SHORTAGE of bituminous coal stares the electrical industry in the face again this year unless the authorities in Washington find a way to increase production. Early in the present year the indicated output of coal for 1918 was 36,000,000 tons less than it was last year and 72,000,000 tons less than it was the year before. The cause assigned for this tremendous falling off in production is car shortage. In handling coal at the mines the procedure has always been to load the output directly from the mines to the cars. If cars are not available, the mines shut down and production ceases. To store coal at the tipples would mean re-handling of the fuel as well as added expense, and besides there is no storehouse comparable to the seams where the coal is found in the earth. It is therefore apparent that, if a shortage is to be avoided, the mines must be kept in operation and every effort made to increase the output. The country needs and must have coal. It is no longer interested in the skill by which the blame is shifted from the coal operator to the railroads and from the railroads to the weather. There is ample time between now and next winter for the Fuel Administration and the railroad director to co-ordinate their work, if they will, so that there shall be no recurrence of the coal famine of 1917. Public utility companies meanwhile should heed the warning which the present situation foreshadows and make every effort to get and to store coal.

Higher Salaries Needed by Engineering Profession

IN THESE days of increasing costs the engineering profession finds itself between the devil and the deep sea. Most engineers are under salary, and we have not discovered any acute symptoms of rising remuneration in this particular line of activity. The comparatively small number of engineers in independent practice can, of course, protect themselves by raising their fees on their own initiative; but they are too few to change the general situation with respect, let us say, to the average members of an engineering society. The long and short of the matter is that the salaried man, whether in a technical position or doing purely commercial work, finds himself "up against it." Perhaps, as Mr. Schwab intimates, the end of the war will find the country in the hands of the workmen. However this may be, the class of workmen who use instruments rather than ordinary tools seem likely to be left out of the reckoning. Undeniably the present situation is ex-

tremely hard on a large proportion of the engineering profession, and the general principles of fair play would seem to indicate that engineers should have a share in the upward movement of compensation demanded by carpenter, machinist, steamfitter and ditch digger. The engineering profession is not unionized, nor even well organized on an individualistic basis, as is the medical profession, in which there has been a very general increase of fees. Neither does it possess, through numbers and system, a powerful influence in the matter of votes. Nevertheless, the gospel of the square deal certainly calls for better compensation than at present rules. To meet the serious demands upon them engineers need larger financial recognition.

Make Your Plans for Third Liberty Loan Now

APRIL 6 is the date set for the campaign to place the third Liberty loan. Manufacturers, central stations and other employers of labor have a special opportunity to enlist their organizations in this army of investors for national service. The general purposes of the loan and the opportunity it offers for every stay-at-home to do his part in the establishment of new ideals for the world will be found in posters, magazines and newspapers. What is most needed, and this is what the practical business men of the industry can supply, is that every business organization form itself now into a branch collection agency for the government. The campaign will be short. Organization within each plant should be perfected now so that bonds can be sold to every one in the organization, from the company and its officials through to the least important member. In subsequent issues the ELECTRICAL WORLD will publish plans and methods successfully adopted by electrical companies. Later in March a special colored poster will be distributed with the paper in addition to an advertising insert contributed by the publisher and by the electrical manufacturers and devised in such a way that the posters that compose it may be placed on office and factory bulletins the country over. That the contributions of the industry may be recorded as completely as possible, the ELECTRICAL WORLD will be glad to receive at once accounts of plans that individual readers already have under way.

Graphical Determination of Line Constants

IN THE case of a simple alternating-current circuit containing in series a condenser and a resistive inductance the alternating current in the circuit may be taken as the same at any instant in all parts. That is, the amperes in the condenser are the same as the amperes in the inductance. The strength of the current is obtainable by Ohm's law, using impedance expressed in complex quantities. When, however, an alternating-current circuit comprises a line or lines possessing distributed resistance, inductance, capacitance and leakage, the current strength is not the same at the same instant in all parts of the circuit. In particular instances the current may be strong and flowing toward the generator at one point on the line, while at the same instant it may be very weak and flowing away from the generator at some other point in the line. In a long line, worked at a fairly high frequency, both the voltage and current may pass through a number of successive maxima and minima, and also through several reversals of direction, as we consider different parts of the line at one and the same instant. It is evident that Ohm's law ceases to be applicable to such a circuit in the ordinary sense. A new law, however, comes into application. In the steady state of alternating-current flow each and every point on the line possesses a certain complex hyperbolic position angle, which increases steadily and continuously with distance toward the generator end of the line, so long as the electrical constants of the line remain uniform, but which undergoes a simple sudden change when a transition occurs from one type of line to another, such as in changing from underground cable to overhead aerial line. The alternating-current strength at any point on the line is then directly proportional to the cosine of the position angle, and the alternating voltage to the sine of the position angle. Knowing the current and voltage at any one point in the circuit, such as the generator end, the current and voltage at any and all other points are immediately determinable by simple proportion, with the aid of existing tables or charts of hyperbolic sines and cosines. The impedance and the power are likewise simple hyperbolic functions of the position angle.

In his article this week T. A. Wilkinson describes an alternative method of deriving the voltage and current at the terminals of a transmission line, based on fundamental hyperbolic functions, but evaluated through the specially prepared charts which accompany the article. By using the vector formulas given at the beginning of the article, the six quantities a_1 , a_2 , b_1 , b_2 , c_1 and c_2 , appearing therein are easily obtainable from the charts, so that the solution follows without difficulty. Since these charts have been carefully drawn, they will be of permanent value, as affording one method of solving any such transmission-line problem.

In the particular arithmetical case presented in the article the length of line is taken as 250 miles (402 km.). This would be a long power transmission line, and yet the effect of taking the distributed capacitance into account by correct methods such as that offered is only a few per cent as compared with the result obtainable with the split-condenser method, in which half the capacitance of the line is assigned to a condenser applied at each end. At frequencies up to 60

cycles per second the effect of distributed capacitance is relatively unimportant on split-condenser computations up to transmission distances such as this. When, however, higher harmonic frequencies are considered, or in telephonic transmission problems, hyperbolic-function methods become absolutely indispensable to the engineer.

Good Practice in Cooling Transformers

IT WAS not so very many years ago that electrical apparatus was designed to run cool merely in virtue of abnormally low energy losses obtained at absurdly high costs of material. It took a long time to inculcate the lesson that the economics of the situation involved far more than I^2R losses. So, gradually, scientific cooling has rid us of more and more heat, and this gain is taken in the form of increased output for a standard rise of temperature rather than fruitlessly as low temperature at standard output.

We have seen no neater demonstration of practical conditions than in Claude H. Shepherd's description of the forced cooling of transformers in a Chicago substation, published in this issue. The starting point was an ordinary three-phase reducing transformer which, owing to heavy load in an abominably hot transformer room, increased in temperature enough to imperil the insulation. Oil at 75 deg. C. and a room at 60 deg. C. form a bad combination. Now, there are in more or less common use three types of transformers, air-cooled, self-cooled oil-filled and water-cooled oil-filled, of which the first is becoming rare, the second is extremely common, and the last, generally provided with cooling coils in the case, is not infrequent in heavy substation work. Mr. Shepherd's feat was to convert the second into the third type by tapping the case and pumping the oil through a cooling system, a simple enough thing to do, but rather better in its results than would at first be supposed.

The so-called self-cooled transformer is quite unexceptionable in small sizes or in the open air where the large cooling surface of the case can be well utilized. But in a superheated transformer room with the usual poor ventilation there is quite another story to tell. The net result in this instance of circulating the oil was to increase the practicable output by 60 per cent and to effect an actual saving in operation big enough to show about 37 per cent on the added investment. Obviously any fairly big transformer can be treated in this manner, the chief matter requiring attention being the arrangement of the intake in such wise as to keep all the hot oil moving. As Mr. Shepherd suggests, a copper cooling coil would be desirable as giving better results with less work in pumping and perhaps with increased output. At all events, the gain in practicable rating proved to be so great as to leave a large reserve capacity in other transformers likewise treated.

In these days of high costs and slow deliveries anything which can avert additions to the plant is worth while, particularly when simple and economical. In ordinary substation working there is no particular trouble in operating an oil-cooling system, and in out-of-doors substations there is generally little need of it. Cooling the oil by circulation through external coils is likely to be decidedly more efficient than the reverse

process of pumping cooling water through coils in the case, since in the first instance a large cooling surface is the more easily provided and the real condition of the oil is easier to ascertain.

Lessons from Steam-Turbine Accidents

ONE of the most serious accidents in the history of steam-turbine development so far as material damage is concerned occurred about a month ago in a generating station of the Boston Elevated Railways. It involved the wrecking of a 35,000-kw. machine with very large damage but fortunately no loss of life. Some of the circumstances of the occurrence are worth noting, as they throw a great amount of light on necessary lines of improvement in building turbo-generators of colossal output. In many lines of machine design mere size does not have to be very seriously considered as a factor in the problem. In case, however, of steam turbines and other fast-running mechanisms in which the factors of safety have to be very carefully considered the influence of dimensions sometimes turns up in unpleasant and unexpected ways. Trouble in the Boston turbine occurred at the low-pressure end in which cast-iron diaphragms were used. As nearly as can be learned from the data at hand, the eighteenth diaphragm buckled, fouling the blades on the corresponding runner and tearing them off. Immediately the next diaphragm gave way, involving the nineteenth wheel, and then the last diaphragm and wheel were affected, ending by tearing open the casing from the immense centrifugal force of the flying pieces.

The circumstances which led up to the accident give important hints as to causes and remedies. Exactly a year prior to the present accident the eighteenth diaphragm deflected in the trial runs, fouled the buckets of its runner and stripped them, likewise damaging the succeeding diaphragm and runner. The throttle was tripped when the buckets began to rub, but the mischief was already under way and promptly followed. Repairs were executed, and the machine did its duty up to the present catastrophe. In this instance the immediate cause of the trouble appears to have been a blow-out in another station which dropped its load of 10,000 kw. and threw it practically in its entirety on the fated turbine. This automatically opened its secondary valve and suddenly and greatly increased the steam pressure in the low-pressure stages, probably thereby causing the distortion of the eighteenth diaphragm which began the trouble. The first sign was rubbing and vibration. An at-

tempt was made to adjust the thrust bearing, but things began to happen inside the casing, the operators wisely took to cover, and in a very brief period the damage was done. How much power was actually thrown on the machine already carrying 32,000 kw. is uncertain, but whatever the load it came on like a battering ram.

The exact details and consequences of the smash-up may perhaps never be known, but some of the morals suggest themselves immediately. First, it seems reasonable that caution should be taken, as in any machine already subject to high strains, to avoid the shock of a sudden impulse. Less speed in the operation of the secondary valve would have dropped the frequency a little and perhaps would have averted the shock that wrecked the turbine. Attempts to force a heavy overload on a machine already close to its rating have to be made with great caution. A sudden short circuit is liable to occur on any system and it is better to yield in load than to run the risk of damage. Further, it looks very much as though cast iron cannot always be considered a suitable material for diaphragms in a machine of these dimensions. In principle it is amply strong—in fact, careful calculations in the case of this particular turbine showed as much—but it is at best a somewhat treacherous material, as many accidents have shown, particularly when subject to sudden and violent strains. A peripheral speed approaching 1000 ft. (328 m.) a second causes even the least rubbing to be serious and to add dangerously to the other strains on the system. Fortunately the throttle was tripped in the course of the proceedings, either semi-automatically by one of the retreating crew or by the vibration itself; otherwise more serious results might have occurred. It would not be impossible to provide for the automatic tripping of the throttle in case of a sudden increase in the differential pressure between the stages, but whether this precaution is desirable is a matter to be left to the turbine designer. Such accidents as this serve notice on the manufacturer and user that in the gradual development of very large sizes critical situations develop, as part of the necessary growth of the art, which eventually may call for material changes in practice.

Certain it is that in this case a serious accident occurred not because of physical faults in the material or incorrect general principles of design, but rather owing to the imposition of sudden strain under conditions which might conceivably have been better controlled and which developed a weakness not ordinarily to be expected in the operation of generating stations with the equipment of the one in question.

IN THE course of investigations to develop a method of increasing the carrying capacity of underground cables a Middle West company has studied the effect of filling the space between cables and their inclosing ducts with crude vaseline. Some very promising results have been obtained which will be presented in a coming issue of the ELECTRICAL WORLD. Since numerous improvements have been made in synchronous motors which make them suitable for many services to which they formerly were unadapted, an article in an

The Coming Issues

early issue will point out just what modern synchronous motors can and cannot do, giving some examples of actual installations. Among other subjects which will be discussed in the future will be important changes that have been made in factory-lighting legislation and the best methods of measuring the internal temperatures in generators. In next week's issue the presentation of the views of L. K. Comstock, advocating the payment of wages in the electrical contracting industry in accordance with index numbers indicating the cost of living, will be concluded.

Raising Wages with Cost of Living

A Plan for Paying Workers in the Electrical Contracting Industry on the Basis of Living Cost as That Cost Is Indicated by Index Numbers of Responsible Commercial Organizations

BY L. K. COMSTOCK

Mr. Comstock is in close contact with the practical problem of labor and is giving it thoughtful consideration so that wages may be made commensurate with living cost. He presented his advanced views recently before the Conference Club, an organization of the larger "interstate" electrical contracting organizations. They will be published in two articles in the *ELECTRICAL WORLD*. This one discusses generally the principles involved. The second one, to appear next week, will show the application.

NO PROBLEMS confront us oftener than those arising from the relation of employer and employee. In fact, this relationship is probably the most important one that engages the attention of the business and industrial world, and transcends in importance the problems now being solved on the battlefields of Europe, although perhaps inextricably mingled with those problems.

We as citizens of the United States, whether we belong to the ranks of labor or the employers of labor, have been derelict in our duty, because we have negligently or deliberately refused to look intelligently into this problem, to seek out the facts of human nature involved, and to be guided by what could have been found. The prejudices and traditions of the past still linger to make the employer look upon labor, not in the spirit of co-operation, but in the spirit of the master toward the servant.

On the other hand, centuries of tradition and prejudice have made the laboring man, the mechanic, look upon his employer as a man to be feared and hated. He has had perhaps a just cause for his servile attitude. But in these modern days of democracy and unions he has felt his strength and has endeavored to obtain by force what he thought he wanted and could get, because he knew no other way. There have been many exceptions, of course, to the general rule, and many employers for generations have had the best of relations with their employees.

OPPORTUNISM VERSUS LOGIC

I think it may be stated without fear of contradiction that these problems taken in the mass have drifted toward temporary or opportunist solution rather than yielded to the power of reason and logic. Most labor disputes in the past have been tinged with anger on one side or the other and generally on both sides, or they have been regarded as sporting events in which the contestants have played for the stakes for sheer love of the game. A labor dispute hardly rises to the dignity of the term unless accompanied by a strike or a lockout; in either of these cases both sides lose, a circumstance readily producing anger, and therefore usually an unjust settlement, divesting the game of its sporting character.

In discussing "war and human progress" Viscount Bryce points out the distinction between two schools of philosophical thinkers or historians. One of these schools emphasizes "the power of reason and of those

higher and gentler altruistic emotions which the development of reason as the guide of life tends to evoke and foster" and finds in these tendencies "the chief sources of human progress in the past and expects from them its further progress in the future." This school regards men "as capable of a continual advance through the increasing influence of reason and sympathy," and dwells upon "the idea of justice and right as the chief factors in the amelioration of society."

THE ARGUMENT BASED ON HUMAN SELFISHNESS

The other school, less optimistic, insists "on the power of selfishness and of passion, holding these to be elements in human action which can never be greatly refined or restrained, either by reason or by sympathy, that social order can be secured only by force—right itself can only be created by force," and that "it is past force that has made what men call right and law and government."

The tendency of this second school is "associated with the less rational element in man—with passion and the self-regarding impulses which naturally attain their ends by physical violence."

The conflict between these two philosophies which Bryce finds is the fundamental provocative of the great world war thoughtful persons find also is the fundamental provocative of industrial conflict.

Boiled down, these two schools of thought can be described as the forward-looking and the reactionary schools. The former builds on faith and the latter constructs its edifice out of the old materials of the past.

After incalculable losses to both employer and employee through many years by reason of strikes and lockouts, it would seem that the time had arrived for these two parties to apply to their differences some degree of intelligence, common sense and sympathy. The union mechanic cannot get along without his employer, nor can his employer get along without his mechanics. This being so, why is it not the part of common sense to admit it frankly and work peaceably in team harness? Let the employer study sympathetically the needs and requirements of his men and likewise let the union see to it that the men work faithfully and sympathetically for their employers.

One of the principal indications of an impending shift in the front of the labor movement in this country is found in the fact that many of labor's foremost spokesmen admit that in increased production lies one of the most hopeful routes to a higher social and economic status for those who work with their hands. In several recent reports—largely influenced by the American Federation of Labor—where this question of the effect of increased production was distinctly raised, labor's representatives refused to oppose increased production as such. This is a far step from the "soldiering" recently openly advocated and practiced.

It may be argued that trade union activity in the

ection of curtailing output, restrictions on apprenticeship and its successful demands for shorter hours made a real contribution toward increased cost of living. This argument is generally believed by certain classes of employers. Let us examine the available data on this subject. The federal bulletin on wholesale prices in 1913 cites twelve important food, fuel and

FIG. 1—RELATION OF ACTUAL RATE OF DAILY PAY TO RATES BASED ON RISING COST OF LIVING

other articles which on the average showed a price rise for the year 1913 more than 60 per cent higher than their price range for the period from 1890 to 1899. The whole 252 articles listed in the bureau's bulletin showed a price rise for the same period of only 35 per cent. It should be stated that eleven of the twelve articles above mentioned were produced by farmers, fishermen, timber men and oil workers. These groups of workers are not organized into unions and yet the commodities they produced show a price rise 70 per cent greater than that of average goods. Apparently organized labor exactions do not account for this great rise in eleven staples.

The great trouble seems to lie in the fact that collective bargaining is conceived in terms of unionism, closed shop and walking delegates, and there does not seem to be a comprehension of the fact that a compromise exists which will safeguard the rights of the employer and worker without injustice to either.

THE OLD METHOD OF BARGAINING NOT THE ONLY ONE
Union leaders have expended their energies in the past, ostensibly at least, to gain higher wages and better working conditions. Employers have with the greatest reluctance yielded in these two sets of demands when their intelligence should have dictated an early and willing acquiescence. By this statement I do not mean to imply a servile acceptance on the part of the employer of any demand, but I do wish to convey the idea that if the employer had earlier recognized the right of employees to unionize, had earlier perceived that the time had come or was at hand when public opinion would support the union demand for a larger and a fairer share in the fruits of his labor, then union labor would have naturally cultivated a more sympathetic attitude toward employers and the dishonest labor leaders would have been robbed of their opportunities for grafting. We talk of open shop and closed shop as though we are entitled to choose under which emblem we desire to conduct our operations. In a limited sense we have this right, but it is well to bear in mind that the right

of employees to strike for any cause or for no cause is sustained by the common law everywhere in the United States, and that agreements among strikers to take peaceable means to induce others to remain away from the works of an employer until he yields to the demands of the strikers are not held to be conspiracies under the common law, and the carrying out of such a purpose by peaceable persuasion and without violence, intimidation or threats is not unlawful. Many of the labor disputes which have reached the courts have been decided according to the common law, but twenty-three states and the federal government have laws or constitutional provisions for arbitration and conciliation, although the federal statute applies only to common carriers engaged in interstate commerce.

Much of our trouble with labor has arisen from that ever-recurring attempt to adjust the wage question. I think it within the limits of truth to say that this question is rarely if ever settled equitably. It is settled usually only after a strike and protracted negotiations, and then without any particular reference to the equities of the case. The side on which the ablest or most stubborn negotiators sit wins out. Such settlements are innocent of scientific considerations of adjustment, and the hidden designs of the negotiators cannot stand the test of daylight.

It can well be admitted that labor is constantly demanding higher wages; the employer as constantly resists; one or the other must give way or a deadlock ensues, and bitterness, perhaps violence, results, with loss to all concerned. A just and scientific consideration of the facts should point the way to any readjustment of wages. Is it not worth while and certainly expedient to inquire, when wage readjustment is demanded, whether or not the facts support such a readjustment?

Wage earners must receive something more than the cost of their support, because if this were not so it would be impossible for them to bring up families and the race of such workmen would not outlast a generation. It would appear, then, that the employer, from purely selfish motives, must take intelligent cognizance

FIG. 2—INCREASES IN COST OF PRINCIPAL COMMODITIES FROM 1890 TO 1918
FIGURES COMPILED BY VARIOUS AUTHORITIES

of the relation between cost of living and rate of wages. As the cost of living rises the rate of wages must advance with equal increments, in order to maintain the relative position in the economic world of the wage earner. No one will deny the correctness of this theory—it remains, then, to find a practical method of its application.

Watch Your Radiation Losses to Help Save Coal

Heat Losses from Uninsulated Surfaces Great Enough to Demand Attention—
Principal Characteristics Needed in Heat Insulation—Thickness
Required and Other Practical Considerations

BY AUSTEN BOLAM

WHILE "bright lights" have been dispensed with, workless days tried, so-called unnecessary industries limited in their use of power or fuel, and such equipment as feed-water heaters, economizers, scale removers, soot blowers, CO₂ recorders, water and steam meters used more extensively than ever to conserve fuel and utilize it more efficiently, heat insulation and heat loss through radiation have not received the attention they deserve. Loss of heat from uncovered or poorly covered steam piping or equipment is more important than it seems on first thought, because the boiler and furnace efficiency must be taken into account. In other words, if condensation occurs it means that the equivalent loss is equal to the superheat plus the latent heat divided by the efficiency. If the condensate is not drained back into the boiler, the heat required to raise the water to the boiling point is also lost. If the efficiency of steam generation is low, say 50 per cent,

FIG. 1—COMPONENTS OF TOTAL LOSS RESULTING FROM UNCOVERED PIPES THROUGH CONDENSATION OF 1 LB. OF STEAM AT 150 LB. PRESSURE

it means that the actual loss is really twice the apparent loss.

Many steam plants have their main steam lines covered with insulation of some kind, but it is a very common practice to omit the coverings on valves, flanges, drips, feed pipes and other minor fittings, often because of a fancied difficulty in providing easily removable coverings. They are also great heat wasters, however. The amount of heat, for instance, wasted by one pair of uncovered 10-in. (25.4-cm.) flanges will probably amount to a ton of coal a year. Removable covers are easily made with a little fine chicken wire and some canvas, burlap or muslin, covered with plastic insulating material. They can be made in halves or sections and held in place by wire wrapping. Boiler tops, ends, drums, breechings and walls all need proper insulation. In the latter instance it will protect against air infiltration as well as from heat loss. A thickness of from 2 in. to 3 in. (5.1 cm. to 7.6 cm.) of covering is the least that should be used.

Writing¹ several years ago, Professor MacMillan said: "The saving due to the use of proper covering is so great that . . . the cost per year rather than the first cost should be the only consideration." In another place he said: "It is a deplorable fact that few steam lines at the present time are provided with thick enough coverings for the greatest net saving." Conditions have not changed appreciably since then, as lack of knowledge regarding the insulating values of different substances

and the extensive amount of guessing at the thickness of covering required indicate. Coal consumption is responsible for from 55 per cent to 75 per cent of the total operating expense of the average power plant or central

FIG. 2—RELATIVE EFFICIENCIES OF FOUR BRANDS OF PIPE COVERING

station. Therefore economizing in any portion of this enormous consumption is well worth the effort.

FALLACY OF RULE-OF-THUMB METHODS

In some cases engineers have decided on the thickness of pipe covering to use by feeling the covering after one thickness has been applied. If too hot, another layer is applied, and so on. Rule-of-thumb methods like this should be abandoned, since no two hands sense temperature alike and the hand can bear a temperature of 150 deg. Fahr. (65.60 C.) without discomfort. To illustrate the loss which can occur if only the touch test is applied for determining insulation efficiency suppose the steam pressure is 100 lb. (7 kg.). The temperature of the steam, without superheat, would be 327 deg. Fahr. (163.9 C.), so that with a temperature of 150 deg. (see above) at the outside surface of the covering the loss would be 40 per cent of the initial heat in the steam, most of it preventable by a covering of sufficient thickness.

Unfortunately there is extensive misinformation re-

FIG. 3—RELATIVE LOSSES WITH DIFFERENT THICKNESSES OF COVERING

Temperature difference between air and steam, 300 deg. Fahr.; size of pipe, 3 in. Data from Armstrong Cork & Insulation Company.

garding the heat-insulating values of different materials, as a number of engineers seem to think that asbestos is a heat insulator, whereas it is a very poor material for this purpose except as a binder. There are many so-called pipe coverings on the market that are

¹Proceedings A. S. M. E., December, 1915.

worthless for anything more than the temperature used for ordinary house-heating, but they are being used in many large installations because they seem inexpensive and after they are on the pipes they look well. That there are no established standards of insulation practice is due largely to the fact that the coverings are commonly bought on a price-per-foot basis instead of on a cost-per-year basis. Competition between different makers is severe, and the temptation to unscrupulous competitors to cut prices at the expense of quality is obvious.

DURABILITY AND EFFICIENCY ESSENTIAL

On the other hand, the highest-priced insulation is by no means necessarily the most efficient. Without some knowledge of the theory of heat insulation comparison of different grades of material is impossible. The value of a heat-insulating material depends entirely on two co-essentials—efficiency and durability. Price is a minor consideration. If a covering will save its own cost in the first few years and will continue doing this as long as the plant lasts, it is a good investment. If

FIG. 4—SIMPLE OUTFIT FOR TESTING HEAT LOSSES FROM PIPES
Removable ends are provided to fit different-size pipes. The ends and periphery are covered with 85 per cent magnesia to prevent escape of heat. From the thermometer readings obtained the heat loss can be calculated.

it falls below this standard, it is dear at any price. There are some materials that will show great efficiency for a short period, but begin to deteriorate rapidly.

No pipe covering is 100 per cent efficient, but there are some that show an efficiency of from 80 to 90 per cent, the actual figures varying according to the thickness, etc. It is quite possible to reach and maintain the larger figure by proper selection and application. In order to set up a standard of comparison, what is perhaps the best-known and most universally used insulating material will be considered—85 per cent magnesia—because it complies almost entirely with all the requirements of a perfect heat resistant both in structure and in efficiency. This material consists of an almost pure crystalline carbonate of magnesia combined with a proportion of mineral fiber (asbestos) to give it the needful structural strength. Its structure is minutely porous, the crystals of magnesia embedding between their walls an extremely large percentage of dead air. In fact, these air cells comprise by far the greater part of the material, each one hermetically

sealed and so minute that millions of them are contained in a single square foot of the insulation.

A necessary consequence is that the substance itself is extremely light in weight relative to other substances. A heavy, dense material cannot possibly be a good insulation, nor on the contrary can one whose structure is so light that the air spaces visibly make up the greater part of the bulk. The general rule may be laid down that large air spaces permit circulation and therefore cannot have real insulation value.

Owing to the tremendous desiccating influence of the long-continued heat on the insulation, organic substances are necessarily barred. Otherwise there are many materials of this class that would make efficient insulating coverings.

Taking bare pipe as a standard for comparing radiation losses,² it can be easily calculated that from each square foot there is roughly a heat loss of 51.7 B.t.u. per degree difference of temperature per hour, or with a steam of 150 lb. (10.5 kg.) a net loss of at least 1½ lb. coal per square foot of pipe per hour, or 36 lb. per twenty-four hours. This loss is continuous as long as there is steam in the pipe and is equivalent to more than 7 tons per year per square foot of pipe. This is an extreme instance, but in so far as it is the practice to allow any kind of steam pipe or feed pipe to remain uncovered, so far do these extreme figures apply. A very few feet of uncovered or badly covered pipe will therefore waste considerable coal.

“Standard” thickness covering is intended for pressures up to 100 lb. (7 kg.) only. Above that point extra coverings are required up to the maximum temperature of about 600 deg. Fahr. (315 deg. C.), which represents the highest practical temperature in modern steam practice. Figures taken from the standard specifications of the Magnesia Association follow:

Steam Pressure (Lb.)	Thickness of Coating.
Up to 100	Standard.
100 to 150	Double standard.
Over 150	3 in.
With superheat	3½ in.

Any engineer can readily compare his own insulation with these standards. If it falls short of these thicknesses, he is probably wasting a good deal of valuable heat.

HEAT INSULATION FROM AN INVESTMENT POINT OF VIEW

When the late Henry G. Scott made what is perhaps the only series of actual tests ever conducted by a user of insulating materials, he pointed out that the following factors should be taken into consideration in selecting heat insulation if satisfactory service is to be expected:

(1) Investment in covering; (2) cost of coal required to supply lost heat; (3) 5 per cent interest on capital invested in boilers and stokers rendered idle through having to supply lost heat; (4) guaranteed life of covering, and (5) thickness of covering. He further says: “It is apparent that the covering which shows a minimum total cost under the first three headings is the best covering to adopt, for the loss of heat at the end of ten years may readily cost more than three times as

²Steam pressures and superheats such as are used in ordinary central-station and power-plant practice are considered. These remarks are only partly applicable to heating or other low-pressure work, or to the use of furnace or other forms of heat reaction.

much as the first cost of the covering." That his conclusions were justified is indicated by the fact that the original (85 per cent magnesia) coverings selected by him are still in use.

In considering the investment value of an insulation durability naturally assumes importance. It goes without saying that the most durable covering will pay best, provided that it is equal in initial efficiency to others under consideration. This point demands greater attention than it often receives, because once the pipes are covered it may be years before they are disturbed again. A poor covering may have lost its efficiency in a short while, but because there is nothing to show this externally it will continue to waste heat for many years or even until the pipes are worn out.

Following is a simple formula which will assist in determining the most economical covering for any given class of service, whether temporary or permanent $(c - a/b)b = d$. In this equation c is the value of the coal saved per year, a is the cost of the covering, b is its life in years, d is the gross return on the investment in the covering.

Thus taking the cost of 100 ft. (30.4 m.) of covering as \$80, assuming its life as fifteen years, and considering that during that time 25 tons of coal at \$4 per ton are saved per year owing to the covering, the gross return on the investment will be $(100 - 80/15)15 = \$1,420$ per 100 ft. of covering.

For comparison consider the cheapest kind of pipe covering, costing \$40, with an estimated life of five years. Assume that the coal saving is 60 per cent of that obtained with the better covering mentioned in the preceding paragraph. Then the gross return will be $(60 - 40/5)5 = \$260$, instead of \$1,420 with the better covering.

In applying this formula to actual practice it must be borne in mind that what is meant by "lifetime" is the efficient lifetime of the covering, during which it will give its maximum service—and not merely the time it will stay on the pipes without falling off.

ELECTROMAGNETIC CONDENSER FOR POWER-FACTOR REGULATION

One Winding of Dynamo Is Inserted in Alternating Current Circuit, the Other Is Excited from Source of Direct Current

Prof. Gisbert Kapp of Birmingham, England, in patent No. 1,236,716, assigned to the Westinghouse company, suggests the use of an electromagnetic condenser to correct for the power factor of inductive apparatus in an alternating-current system. According to the inventor, a dynamo-electric machine wherein either the stator or the rotor winding is inserted in the alternating-current circuit in which it is desired to adjust the power factor is employed, and the remaining winding is excited from a source of direct current.

The rotor of the machine is therefore oscillated in synchronism with the frequency of the alternating current, absorbing energy from the latter portion of each current wave, storing the energy in the form of momentum, and recuperating the energy just before and upon the first portion of the succeeding wave. The phase of the resultant current wave may be made to

approximate that of the attendant voltage wave as closely as desired.

The stator winding is, for the sake of simplicity, shown as a ring winding, but a drum winding may be employed. The iron core of the stator carries an alternating current winding. A bar magnet is pivoted and provided with a direct-current winding, which latter may be put in series with the direct-current winding on the stator. The pole pieces of the magnet are so shaped as to sweep as closely as is mechanically possible in front of the stator winding. By this construction, with a given field excitation, a magnetic field of maximum strength is obtained. The object of the series winding is to secure to the magnet a zero position and to prevent it from vibrating through a greater angle than 90 deg. from the zero position.

So long as no alternating current is sent through the stator the vibrator will remain at rest in such position that its magnetic axis will coincide with the magnetic axis produced in the stator by its direct-current winding. If an alternating current of the low frequency of the slip is passed through the stator, the bar magnet is acted upon by mechanical forces that alternate in direction with the alternations of the current, and is thus set

PRINCIPLE OF ELECTROMAGNETIC CONDENSER

into vibration of the same frequency. Owing to the interaction between these electrodynamic forces and the mass inertia of the vibrator, the zero position is passed at the instant when the current passes through zero, while the reversal of motion takes place at the instants when the current has crest values. Since on passing zero position the vibrator has maximum speed, the emf. induced in the stator winding is at these instants also at maximum.

Thus the condition of quadrature between the current causing the vibration and the emf. produced by this vibration is brought about. That the emf. must be a leading emf. will be obvious from the following consideration: After passing zero position in either sense, the current opposes the motion, and thus brings the magnet to rest at the end of its swing. The energy stored kinetically in the vibrator is during this period transferred electrodynamicly to the alternating-current circuit. The circuit receives energy during the time that the current grows. On reversal, when the vibrator approaches its zero position, it must be accelerated by the dynamic force of the current. The vibrator takes energy from the circuit during the time that the current decreases from its crest value to zero. Thus the circuit receives energy while the current is growing, and must yield up energy while the current is waning.

voltage consumed through the line resistance. $XV = A$ is the no-load voltage at the generator end of the line and VH is the voltage rise at the receiver end due to the capacity effect.

Chart B represents the impedance triangle of the line, in which b_1 corresponds to the total resistance, b_2 to the total reactance and B to the total impedance, these constants being simply the values of R , X and Z as modified by their distributed nature.

Chart C represents the charging current of the line. c_1 is the equivalent total capacity of the line. C is the total charging current per volt, of which a small component c_1 is in phase with the voltage. As c_1 is always very small in comparison with C , its numerical effect on the value of C is negligible, and for all numerical values both C and c_1 can be disregarded, c_2 giving the charging current to a high degree of accuracy.

SOME RELATIONS SHOWN BY CHARTS

The charts show in a clear and interesting manner the effect on the line constants of the distributed nature of the resistance, inductance and capacity of the circuit. In Fig. 1 OL represents the values of the coefficients of $1 - a_1$ and a_2 for a given frequency, based on the exponential formula, in which the exponents of l vary with the distance. OM corresponds to the exponent 2 for all distances. The values of $1 - a_1$ and a_2 , therefore, as determined from points along OM , will be $(xb/2)^l$ and $(rb/2)^l$ respectively.

The difference between the constants as determined from points P and Q is, therefore, that due to the difference in the exponents. It was shown in the previous article that the integral exponents give values of the constants corresponding to the assumption of lumped capacity and that the difference between the integral and true exponents represents the distributed effect. This effect is shown by the separation of points P and Q , in Fig. 1. The projections of PQ on OY and OX show at P_1Q_1 and P_2Q_2 the effect on each component separately. OP_1/OQ_1 and OP_2/OQ_2 are the ratios of the true value of $1 - a_1$ and a_2 by the hyperbolic formula to their values based on the assumption of lumped capacity.

It is interesting to note that b_1 , corresponding to the ohmic resistance of the line, is the constant most affected by the distributed properties of the circuit. This constant reaches a maximum value at 60 cycles, for any value of r , at about 500 miles and decreases rapidly at greater distances. The ratio of b_1 to R at 500 miles is 0.67 and at 750 miles only 0.32. This brings out strikingly the fact that for a 60-cycle line the ohmic drop, with a given conductor, due to the load current, is a maximum at 500 miles, while in a line of quarter wave length it is less than one-third that of a short line of the same total resistance.

NUMERICAL EXAMPLE

The following example will illustrate the use of the charts in determining the line constants for a particular case:

Assume: Distance, 250 miles; frequency, 60 cycles; conductor, 300,000 circ. mil stranded copper; spacing, 15 ft.

From wire tables:

$$r = 0.189 \text{ ohm,}$$

$$x = 0.811 \text{ ohm,}$$

$$b = 5.30 \text{ micromhos.}$$

Calculate:

$$xb = 0.811 \times 5.30 = 4.30,$$

$$rb = 0.189 \times 5.30 = 1.00,$$

$$rb^2 = 0.189 \times 5.30^2 = 5.31.$$

From charts:

$$a_1 = 0.87, \quad a_2 = 0.030,$$

$$b_1 = 43, \quad b_2 = 193,$$

$$c_1 = -0.000013, \quad c_2 = 0.0013.$$

Conditions at the sending end when the above line is delivering 20,000 kw. at 110,000 volts, with power factor 0.95 lagging, are calculated as follows, for one phase, where P_0 and P_t are kilowatts at receiving and sending ends respectively:

$$E_0 = 110,000/\sqrt{3} = 63,500 \text{ volts.}$$

$$P_0 = 20,000/3 = 6667 \text{ kw.}$$

$$I_0 = 6667/(63.5 \times 0.95) = 110.5 \text{ amp.}$$

$$\begin{aligned} E_t &= 63,500 (0.87 + j0.030) + \\ &\quad 110.5(0.95 - j0.31)(43 + j193) \\ &= (55,200 + j1900) + (105 - j34.3)(43 + j193) \\ &= (55,200 + j1900) + (11,140 + j18,790) \\ &= (66,340 + j20,690) \\ &= 69,500 \text{ volts.} \end{aligned}$$

$$\begin{aligned} I_t &= 110.5(0.95 - j0.31)(0.87 + j0.030) + \\ &\quad 63,500(-0.000013 + j0.0013) \\ &= (105 - j34.3)(0.87 + j0.030) + (-0.83 + j83) \\ &= (92.4 - j26.7) + (-0.83 + j83) \\ &= (91.6 + j56.3) \\ &= 107.5 \text{ amp.} \end{aligned}$$

$$\begin{aligned} P_t &= 66.34 \times 91.6 + 20.69 \times 56.3 \\ &= 6076 + 1160 \\ &= 7236 \text{ kw.} \end{aligned}$$

At no load:

$$E_t = (55,200 + j1900) = 55,230 \text{ volts.}$$

$$I_t = (-0.83 + j83) = 83 \text{ amp.}$$

$$\begin{aligned} P_t &= 55.2 \times -0.83 + 1.9 \times 83 \\ &= -45.8 + 157.7 = 111.9 \text{ kw.} \end{aligned}$$

$$\text{Regulation} = (55,230 - 69,500)/63,500 = -22.5\%.$$

$$\text{Efficiency} = 6667/7236 = 92.1\%.$$

$$\text{Power factor} = 7236/69.5 \times 107.5 = 0.969.$$

As the current phase angle, $\tan^{-1} 56.3/91.6$, is greater than the voltage phase angle, $\tan^{-1} 20.69/66.34$, the power factor is leading.

Data from a Coal-Mining Company Supplying Public Utilities

The Eastern Utilities Coal Company, controlled by the Eastern Power & Light Corporation, which is under the management of W. S. Barstow & Company, New York, supplies part of the coal required by subsidiary public utility companies. With regard to the present outlook it reports that the mines with 9-ft. (2.7-m.) seams have a capacity of 10,000 tons monthly, which can be readily increased. The following data are taken from the company's report of operations:

In June, 1917, with 102 cars supplied, its output was 5390 tons, which represented a percentage of capacity amounting to 53.9. This was increased to 6890 tons in July, or 68.9 per cent of capacity, with a total of 151 cars. This ratio was well maintained through the summer and fall. In December there came a slump to 3610 tons, 36.1 per cent of capacity, only eighty cars being supplied, and in January, 1918, there was a further decline to 2490 tons and fifty-two cars. In February the output rose to 3380 tons, with seventy cars.

Simple Method of Measuring Emfs. Accurately

Description of a Means That Will Be Found Applicable to Determining Temperatures with Thermocouples, Potential Drops Across Resistance Standards and Shunts, and Other Objects

BY F. WENNER, PAUL D. FOOTE AND E. E. WEIBEL

HERE are two general methods for measuring the emf. of a thermocouple, one requiring the use of a potentiometer and the other involving the use of a galvanometer or millivoltmeter. The potentiometric method affords the most accurate means of measuring the emf., but the galvanometer method is also used extensively because the instruments are direct-reading and require no preliminary adjustment. However, unless the galvanometer is of very high resistance compared with that of the thermocouple and lead wires, the latter is a general being a quite variable factor, the instrument will not read correctly.

The object of the present note is to describe an instrument which combines several desirable features of each method, namely, cost of manufacture not much greater than that of a high-grade galvanometer, readings entirely independent of lead resistance, apparatus accurate and probably more robust than the best galvanometers of high sensitivity. Two methods have been devised which differ from the one devised by Northrup* mainly in that the balance is indicated by a zero change in the deflection of the millivoltmeter, on closing a key, rather than by a zero deflection. One of the methods also differs from Northrup's method in that the balance usually need not be made to so high an accuracy as that sought in the measurements.

The methods described here are not only applicable to the measurement of the emf. of thermocouples by means of a millivoltmeter (or galvanometer), but also to the measurement of the emf. in circuits of any resistance not large in comparison with the resistance of the measuring instrument. Examples are the measurement by means of a millivoltmeter of the drop in potential across resistance standards (or shunts) carrying a current, when the resistance of the leads is high and unknown, and the measurement by means of a millivoltmeter of the open-circuit voltage of a battery or the voltage of a battery so located that connection can be made to it only through a line of fairly high resistance.

ONE METHOD OF MEASURING THERMOCOUPLE EMF.

For one of the methods the arrangement of the circuits is as shown in Fig. 1. With the rheostat or slide wire adjusted so that the millivoltmeter gives the same indication both with the key open and with the key closed there is a balance between the emf. of the thermocouple and the potential drop across the millivoltmeter. Consequently the drop in potential between

the terminals of the thermocouple, which, with the key closed, is the reading of the millivoltmeter, is the same as its electromotive force.

Method of Balancing.—(1) The reading of the millivoltmeter or the position of its pointer is noted with the key closed; (2) the key is opened and this results in a change of the position of the pointer, depending on the lack of balance; (3) the contact on the slide wire is adjusted so as to bring the pointer back to or slightly past its first position. This brings about more nearly the condition for a balance. This process is, therefore, repeated until a balance is established to the accuracy required, which need not be high in case the resistance of the thermocouple is low in comparison with the resistance of the millivoltmeter.

In general the error resulting from a lack of balance is the same fraction of the lack of balance as the resistance of the thermocouple is of the resistance of the thermocouple and millivoltmeter. For example, if the resistance of the thermocouple is one-tenth the resistance of the millivoltmeter and the contact on the slide wire is adjusted so that, with the key open, the drop in potential across the millivoltmeter is 0.9 or 1.1 times the emf. of the thermocouple, the error in the reading, on closing the key, is only slightly in excess of 1 per cent. This for most industrial purposes is of little or no consequence. However, had there been no compensation—that is, had the electromotive force been measured directly with the millivoltmeter—the error would have been 9 per cent.

SECOND METHOD

For the other method the arrangement of the circuits is shown in Fig. 2. Here the millivoltmeter constitutes one arm, the slide wire R another arm, and the resistances P and Q the remaining two arms of a simple bridge. Since the bridge is balanced, the drop in potential across the slide wire R is the same as the reading of the millivoltmeter and the points G and G' of the bridge are at the same potential. Consequently, if the adjustments are such that there is no change in the reading of the millivoltmeter on closing the key, the emf. of the thermocouple is that indicated by the millivoltmeter multiplied by the ratio of the resistance between the sliding contact and G to the total resistance of the slide wire R . For example, if the millivoltmeter reading is 100 and the slide wire has 100 divisions, then each division between the sliding contact and G corresponds to a difference in potential of 1 millivolt.

Procedure in Making a Measurement.—First, with the key open, the contact on the slide wire S is adjusted so that the millivoltmeter reading corresponds to the full scale reading on the slide wire R ; then the key is closed and the contact on the slide wire R is adjusted so as to make the millivoltmeter reading the same as before closing the key. The emf. or temperature is then read from the scale of the slide wire R .

*At a meeting of the American Physical Society held at Washington in April, 1915, Dr. Northrup described a potentiometer method in which a single millivoltmeter is made to serve both in place of a galvanometer and of a standard cell. With this method the millivoltmeter is connected, first, in series with the thermocouple and indicating (by a zero deflection) when there is a balance—that is, when the potential drop in the potentiometer is equal to the electromotive force of the thermocouple—and, secondly, across the potential terminals of the potentiometer for measuring the potential drop. The arrangement is such that the potential drop is not changed as a result of the current through the millivoltmeter. A similar method is used in an instrument manufactured by the Westinghouse Electric & Manufacturing Company (see *Electrical Review and Western Electrician*, Vol. 70, p. 98, 1916.)

For either method provision should be made for easily opening the battery circuit when the apparatus is not in use. This may be accomplished by making it possible to move the sliding contact past the end of the

FIG. 1—ONE METHOD OF MEASURING THERMOCOUPLE EMF.

The resistances *A* and *C* and the slide wire *B* serve as means for adjusting this current so that the drop in potential in the millivoltmeter is equal to the electromotive force of the thermocouple. When this adjustment is made no current is drawn from the thermocouple on closing the key, consequently the resistance of the thermocouple does not affect the reading of the millivoltmeter.

slide wire *B* or slide wire *S*, or by means of a key, not shown in either diagram, in the battery circuit.

ACCURACY OBTAINABLE

While the resistance of the thermocouple does not affect the accuracy of the measurements when there is a balance, it does affect the accuracy with which the balance can be made. Still, with the resistance of the thermocouple in Fig. 1, or the thermocouple and slide wire *R* in Fig. 2, less than twice the resistance of the millivoltmeter, there should be little difficulty in making the balance with sufficient precision so that the electromotive force may be measured to an accuracy about the same as would be obtained if the thermocouple had no resistance and its emf. were measured directly with the millivoltmeter; that is, to the accuracy of the indications of the millivoltmeter.

In a particular case if the thermocouple gives an emf. of 15 millivolts at the maximum temperature at which it is to be used and has a resistance of less than 20 ohms, the millivoltmeter should have a range of 15 millivolts and 10 ohms is a satisfactory value for its resistance. In this case a single dry cell constitutes a very convenient source of current.

For the arrangement shown in Fig. 1 the millivoltmeter should be reliable at all points on its scale to an accuracy a little higher than that sought in the temperature measurements. Convenient values for the re-

FIG. 2—ANOTHER METHOD OF MEASURING THERMOCOUPLE EMF.

The resistance *U* and the slide wire *S* serve as a means for adjusting the current through the bridge so that the drop in potential across the millivoltmeter has a desired value larger than the electromotive force of the thermocouple. When the contact on the slide wire *B* is adjusted so that there is no change in the reading of the millivoltmeter on closing the key no current flows in the thermocouple, consequently its emf. is equal to the drop in potential between the sliding contact and *G* (or *G'*) and may be read directly from the position of the sliding contact.

distances are: *A*, 50 ohms; *B*, 5 ohms; *C*, 50 ohms. As the results obtained do not depend upon accuracy in the adjustments of the resistances the apparatus aside from the millivoltmeter and thermocouple may be of very simple construction.

For the arrangement shown in Fig. 2 the millivoltmeter should be reliable at the reading used to an ac-

curacy a little higher than that sought in the temperature measurements. Convenient values for the resistances are: *P*, 25 ohms; *Q*, 50 ohms; *R*, 5 ohms; *S*, 5 ohms (variable from 4 ohms to 5.5 ohms); *U*, 60 ohms. The resistances *S* and *U* need not be adjusted to any definite values, but *P*, *Q* and *R* should be so adjusted that the bridge will be balanced to an accuracy a little higher than that sought in the temperature measurements.

With either method, if all the thermocouples to be used with any one equipment give the same emf. for the same temperature, a condition well satisfied by the rare metal couples now obtainable, the apparatus may be calibrated so that the temperature is read directly from the scale of the millivoltmeter in one case and from the scale of the slide wire in the other case.

INCREASING TRANSFORMER CAPACITY BY CIRCULATING OIL

Installation of Oil-Circulating System at Cost of \$700 Increased Permissible Loads on 200-Kva. and 450-Kva. Transformer Banks 60 per Cent

BY CLAUDE H. SHEPHERD

Electrical Engineer for the Lincoln Park Commissioners, Chicago

WHEN the main substation at Lincoln Park, Chicago, was built all multiple-circuit power was supplied by a bank of three 150-kva., 12,000/2300 volt, 60-cycle, single-phase, oil-filled, self-cooled, station-type transformers connected delta on the primary side and star on the secondary. These units were installed in an angle of the bus chamber as shown in the accompanying sketch. One spare transformer was provided but never used. Later a 200-kva., 12,000/2300-4000-volt, three-phase, oil-filled, self-cooled, station-type transformer was installed in the location shown and connected by means of double-throw disconnecting switches so it could be used in place of the 450-kva. bank. When this reserve equipment was put into service it was found that owing to the temperature of the bus chamber, which contains more than forty transformers, all of which are operated at night, the three-phase equipment became so hot as to be unsafe. The oil often attained a temperature of 75 deg. C.

To remedy this condition a ventilating system was installed and operated in such a way as to change the air about once in five minutes. This helped but did not eliminate the excessive heating of the transformers, and it was feared that the interior layers of insulation were beginning to carbonize. Sludge was rapidly forming in the oil so it was feared that unless drastic steps were taken immediately some of the three-phase equipment might be lost as the heat was actually unbearable in the immediate vicinity of either the three-phase bank or the single-phase transformer, the room temperature often attaining 140 deg. Fahr. (60 deg. C.).

Consequently oil-cooling apparatus was purchased and installed, practically no interruption of service being experienced, although the work was done under the most adverse conditions and in close proximity to both the 4000-volt and 12,000-volt buses.

By reference to the drawing it will be seen that the transformer oil is drawn by a direct-connected centrifugal pump directly from the transformer cases into an accumulator or settling tank and thence into the

pump, which discharges full volume into and through the cooling coils, the latter being immersed in constantly circulating water. From there the oil is discharged through a submerged outlet into the transformer. Two different suction systems were used. For the three-phase transformer the oil suction was taken

through an already established connection at the bottom of the case, thus allowing automatic priming of the pump. In the case, however, of the three 150-kva., single-phase units it was found advisable to take the oil from the hottest part of the case, which was at the top next to the wall, the individual sections being brought forward through the thermometer wells to regulator valves discharging into the main suction pipe or line. The discharge in each case was submerged and additional safety was assured by the use of fiber discharge nozzles.

It will be noted from the drawing that section valves are placed in the two main suction lines and that individual regulator valves have been placed in each individual suction and discharge line, and that a pump

FIG. 1—LAYOUT OF PIPING USED IN CIRCULATING OIL IN TWO BANKS OF TRANSFORMERS TO GET INCREASED RATING OUT OF THE TRANSFORMERS

throttle was also installed, giving absolute control of the oil flow and allowing perfect adjustment under all conditions. A separate make-up funnel and valve were connected to the accumulator tank, and a T-connection and valve were placed in the discharge line, allowing oil to be either added to or taken away from the system at any time. With this arrangement it is obvious that the four transformer cases with oil at the proper level act as a reservoir system for each other, allowing levels

to be adjusted or oil to be completely shifted from one case to another at any time. This plan gives assurance of great flexibility.

A thermometer is installed in the individual section for each transformer and at the suction and discharge of the cooling coils, giving complete data on the temperatures. An oil gage is installed on each transformer

to show the oil level and an air-bleeder valve is installed on the accumulator tank. The cooling water is supplied by the city system and is piped into the bottom of the coil tank. The overflow is installed near the top of the tank at such a level as to keep the coils always submerged. The supply connection is made through a T at the bottom of the tank, the continuation of the supply line being connected through a stopcock into

TABLE II—COST OF OIL-COOLING INSTALLATION

LABOR	
Machinist, 79 hours at 55 cents.....	\$43.45
Steamfitter, 92 hours at 48 cents.....	44.16
Helper, 79 hours at 38 and 40 cents.....	30.50
Class A electrician, 99 hours at 75 cents.....	74.25
Engineering and overhead.....	\$192.36
MATERIAL	
Fittings	\$8.59
One 14-in. by 30-in. galvanized-iron expansion tank	9.38
One 18-in. by 45-in. galvanized-iron tank with cooling coils	71.50
162 ft. 2-in. black pipe at 39 cents.....	6.42
Six 0-110 deg. C. thermometers.....	57.38
One 1/2-in. by 6-in. water glass.....	.10

24-ft. No. 8 fine stranded wire.....	.10
One oil pump driven by 1700-r.p.m. three-phase, 3-hp., 220-volt, 60-cycle motor, 50 g.p.m., 30-ft. head	165.00
Four transformer oil gages.....	6.28
Grand total	\$700.61

the overflow line. Hence by closing the supply valve and opening the stopcock the tank may be quickly drained, a special air-bleeder line being provided to facilitate this operation. Three-phase energy is supplied to the pump motor from 220-volt taps on the secondary side of the main transformers. As the system is self-priming, no attention is paid to the pump during a shutdown as it will automatically come into operation again when the power supply is re-established.

For about six weeks during last summer the 200-kva.,

three-phase transformer carried in actual operation a maximum day load of 325 kw. for about five hours per day with a maximum oil temperature of 41 deg. C. (105.8 deg. Fahr.), and a cooling water temperature of 44 deg. Fahr. (6.7 deg. C.). The cooling system, it is apparent, has increased the capacity of the 200-kva. transformer over 60 per cent. As this has been the maximum multiple circuit load so far, the 200-kva. transformer should have ample capacity when operated with the cooling system to "pull" the entire multiple-circuit load. In fact, since the installation of the cooling system it has never been necessary to operate the 450-kva. bank. Assuming the same relative percentage of core losses on both the 450-kva. bank and the 200-kva. transformers and allowing for the 1 kw. necessary to operate the cooling system, it is estimated that a net energy saving of \$0.72 per day is obtained with the cooling system in operation, energy costing 0.0075 cent per kilowatt-hour. Assuming a percentage increase in the capacity of the 450-kva. bank on the basis of 60 per cent, it will be possible to pull a load of 720 kw. on this bank. The only doubtful point is whether or not the interior layers of insulation are beginning to carbonize. This question will be investigated during the winter,

but judging from the quality of the oil now in the transformers no damage from this cause has appeared so far.

The test data in Table 1 show that in spite of the fact that the load was increased when the pump was started and remained at 175 kw. all night, the temperature of the circulating oil was steadily reduced from 37 deg. C. to 34 deg. C.

It will be noted that the temperature jumped from 26 deg. C. to 36 deg. C. when the pump was started, but this is due to the thermometer being in the suction riser. It indicates the riser temperature until the pump is started, thereafter the case temperature.

One change is necessary before the efficiency of the cooling system will be considered entirely satisfactory, and that is to substitute copper coils for iron pipe. The latter was used in place of copper because of the high initial cost of the copper. However, it has been found that for each passage of the oil through the cooler the temperature drop is from 2 deg. C. to 5 deg. C., whereas with copper coils it is expected that the temperature drop will be much greater. It is estimated that the investment in the present oil-cooling equipment earns about 37.3 per cent annually.

War-Time Methods of Bill Delivery

The Experience of Many Central Stations in Adjusting Themselves to Higher Postage Rates and Scarcity of Labor, Together with Comparative Statistics of Cost on the Different Methods

WITH the thought and energy of every central station concentrated as never before on measures of economy, a great many companies have turned a searching eye on their methods of delivering the monthly statement. The increase in the postal rates has brought a considerable additional cost in many cases, and the loss of men into the national service has generally reduced the organization available for carrying on routine work of this kind.

When the postage rate went up, of course, the idea of discontinuing the mailing of the monthly service bills and delivering them instead naturally suggested itself. There is more than the question of cost involved, however, for the mailing of a bill is generally conceded to be satisfactory proof of its delivery. Moreover, if delivered by hand, should this be done by meter readers, high-school boys, old men, girls or women? Or, if mailed, which is the better—post-card or regular bill inclosed in envelope? These questions are particularly pertinent right now and worth consideration by every central station.

Not long ago—but before the postal rates went up—the Cleveland Electric Illuminating Company made an analysis of the cost of its bill delivery, which includes 60,000 bills delivered by hand and 40,000 by mail, to find out how much could be saved by using a post-card bill. The figures were found to be as shown in the table on the next page.

With the 1-cent postage rate the post-card proved to be the cheaper method, but the doubling of this cost made the hand-delivery system far more economical. The system in Cleveland has been to place the delivered

bill in the consumer's mail box, or if there is no box to hand it to a member of the family. Failing this, the distributor brings back the bill and it is mailed. For this delivery the Cleveland company first tried boys sixteen or eighteen years old, but did not find them satisfactory. It then employed elderly men of from fifty to sixty-five years and has practically eliminated all complaints.

In Sandusky, Ohio, however, the Sandusky Gas & Electric Company has had most satisfactory results from high-school boys, who both read the meters and deliver the bills. The boys receive 1 cent per meter read. Before the postal rate went up the company used government post cards, but since then it has devised a card of the same size, of which a six months' supply can be printed in advance. These are stamped and mailed to customers beyond the convenient reach of the delivery routes, but the bulk of them the boys deliver at a cost so far of approximately a half cent per bill. This the company finds is effecting a saving of \$18 per 1000 customers per month on postage alone and is bringing additional economy by reducing the operating force to a minimum during the winter. Because of the limited number of hours that the students have available for this work, it is necessary to employ a much larger number than if the regular employees were handling it, but this has not proved an objection. About 9000 bills are delivered in Sandusky between the twentieth and the last of each month.

In Mobile, Ala., the company now delivers by hand at a cost of about 1½ cents per bill, a saving of about \$37.50 a month since the postal increase. In Traverse

City, Mich., the company delivers to about 1400 consumers at a cost of 1 cent, and this also includes collecting about one-third of the accounts. In Pine Bluff, Ark., the company delivers 4500 bills, using the regular meter readers after the readings are completed. It requires from four to five days and costs in all, it is figured, from \$10.50 to \$12.50. In Kokomo, Ind., the company has also changed from mailing to delivery and is distributing 6000 bills by meter readers at a cost of \$35. In Kingston, N. Y., the meter readers now deliver 5800 gas and electric bills, all except about 300 which are mailed to outlying territory, and the company finds the

COMPARISON OF COST OF PRESENT SYSTEM OF HANDLING 100,000 CONSUMERS' BILLS PER MONTH WITH PROPOSED SPECIAL CARD OR GOVERNMENT 1-CENT POST-CARD SYSTEM, AT CLEVELAND, OHIO.

Present system, printed bill in outlook envelope; 60,000 delivered by company distributors, 40,000 mailed with 2-cent stamps.

system quite as dependable as by mail. It saves approximately \$50 every month. In Indianapolis the metermen of the Merchants' Heat & Light Company read meters every morning and deliver bills in the afternoon, and they have proved much more responsible than schoolboys, though boys were tried. The cost per bill now figures about 1 cent. In Denver the bills are mailed to the suburbs but delivered in the city by boys and young men on bicycles at a cost of one-third of a cent per bill.

In Wilkes-Barre, Pa., 19,500 bills—gas, electric and steam heat—are delivered by two men, who receive \$65 per month, delivering continuously, which means a cost of about one-half cent per bill. These men collect when possible as they deliver. In Terre Haute, Ind., the company formerly had mailed all bills at a total cost of \$125 monthly, but with the higher postal rate began delivering all bills within the city by one man, who is paid \$45. The remaining postage cost for

bills still mailed is also \$45, so that in spite of higher postage the company is saving \$35 monthly.

The consensus of opinion, therefore, judged from the experience of these and a large number of other cities heard from, would clearly recommend the delivery of bills within the centers of dense population. One Pennsylvania company, moreover, which operates through an extensive rural territory serving about 75,000 population, is delivering all bills in spite of distances, and claims a delivery cost of 0.92 cent per bill on a total of 7016 bills. This company lays much stress at the same time on the value of the collectors in maintaining good relations with the consumer, a point which is echoed by a number of other companies. Men are picked who do their work in a friendly spirit, and much good comes of it.

On the other hand, in many outlying towns in Indiana the Indiana Railways & Light Company began with this year to try the plan of not sending any bills at all to some 2000 customers, who are asked to call at the local offices to pay their bills, though delinquency notices are still mailed when necessary. In line with this, in Brattleboro, Vt.; in Franklin, Ind., and in Seymour, Ind., the local utilities have been furnishing many customers with cards on which to make their own meter readings. This method has met with considerable success. In Fort Madison, Iowa, the meter reader in certain residence districts carries with him bills already partly made out, on which he enters the reading, making out the bill and presenting it for collection at the one call. The company's other bills go out on post cards, and, in short, since the rates went up there has been a decided movement in the industry toward the post-card bill as offering an appropriate war-time economy.

FEW COMPANIES USING WOMEN

All in all, however, the trend is toward delivery, if not by meter reader, then by boys or old men. One New England central station has found a practical solution by making use of the services of the substitute postmen, who, though on waiting orders, are familiar with the town and have received instructions in delivering. Everywhere the possible expedient of utilizing women for delivering has been considered, but apparently it has not been adopted very largely. However, El Reno, Okla., reports the bill delivery in charge of two young women, who are taking care of it well and at a saving of \$30 monthly on postage. At Binghamton, N. Y., girls are used to read meters and deliver bills.

Of course, the many cities where bills have always been mailed at the 2-cent rate are not affected by the postal increase. Buffalo and Wilmington, Del., state that they have no intention of changing, for they consider mailing less trouble and more sure. In Detroit, on the other hand, the company has been delivering bills by messenger for years at a cost much less than postage, the meter readers delivering the bills. In Providence, R. I., the method is optional with the consumer in most districts. He may have it by mail or messenger, as he prefers, and bills for suburban towns are delivered to the suburban post offices and mailed there under the local rate. There is plainly enough diversity, therefore, to suggest the advisability of every man looking well to his own conditions locally; but in the majority of cases delivery seems to be the preferred method.

Getting the Most Out of Turbo-Generators

Cleaning and Cooling Ventilating Air Not Only Increases the Rating and Reduces the Possibility of Burn-Out but Also Obviates Overhauling of Generator for Cleaning, with the Attending Disadvantages

BY L. H. PARKER AND J. J. PREBLE
Spray Engineering Company

WITH the advent of the modern horizontal-shaft steam-turbine generator, the ratio of the total kilowatt capacity to the cubical contents of power-plant engine rooms has increased at least two-fold or threefold. The necessity for adequate ventilation must, therefore, be recognized in order that a safe operating temperature for the electrical apparatus may be maintained and extreme engine-room temperatures avoided for the comfort of the attendants.

The enormous quantity of air required for ventilating large generators is perhaps better understood when the actual weights are considered. Assume, for example, a 20,000-kva. machine requiring 65,000 cu. ft. (1840 cu. m.) of air per minute. As this amount of air weighs about 2½ tons, the generator will handle an amount of air equal in weight to its own weight in from one-half to three-quarters of an hour.

While no one questions the necessity of supplying a generator with a sufficient amount of ventilating air, there are many who do not give the temperature and quality of the air sufficient consideration. The turbine manufacturers equip their machines with fans designed for handling the proper volume of air, but upon the consulting engineer, manager or superintendent of the plant falls the duty of seeing that adequate air-conditioning apparatus is installed, so that the machines will also receive cool and clean air. One effective device that can be used for this purpose is a properly designed water-spray type of air washer and cooler.

CLEANLINESS AND TEMPERATURE

Air in almost any locality contains considerable dust and dirt. In the vicinity of power plants it may be assumed that roughly one-hundred-millionth of the volume of the air consists of dust, dirt and other foreign particles. This would mean that with a machine handling 65,000 cu. ft. (1840 cu. m.) of air per minute, as mentioned heretofore, a total of 93,600,000 cu. ft. (2,650,000 cu. m.) would be handled in twenty-four hours. On this basis the amount of dirt passing through the machine in this period would be 0.936 cu. ft. (0.026 cu. m.), or 86 cu. ft. (2.4 cu. m.) in three months.

A certain proportion of this, because of air swirls and eddies, will necessarily be deposited in the air passages. Such deposits of dirt become a serious handicap to the ventilation. The air passages become partly clogged, causing a decrease in the quantity of air handled, and the cooling effect is greatly diminished owing to the fact that air cannot come in direct contact with the heat-radiating surfaces. Air taken from the inside of a power plant usually contains oily vapors, which make accumulations on the air passages rapid.

Unwashed air means dirty generators and excessive heating, which not only reduces the electrical efficiency but shortens the life of the insulation. Unless the machines are taken apart and cleaned periodically, grounds

and even burn-outs are liable to occur. The cost of thoroughly cleaning a generator amounts to considerable, and under average conditions this has to be done about twice a year. The expense of dismantling and cleaning a 10,000-kw. unit would be about \$500 for each operation, without taking into consideration the revenue lost owing to the machine being out of commission.

Since a generator which receives clean air is comparatively free from all such troubles, it is apparent that an air washer will practically eliminate any danger of a serious accident, with a resulting loss that might exceed many times the cost of the installation.

As all modern units are designed for a certain allowable maximum temperature in the armature and field windings, the temperature of a generator with a given load will be a fixed amount above the temperature of

FIG. 1—TYPICAL ARRANGEMENT OF AIR WASHER WITH RESPECT TO GENERATOR

the ingoing ventilating air, which must be well below the critical temperature of the insulation. The cooler the air delivered to a generator, therefore, the greater will be its load-carrying capacity.

The permissible load on a turbo-alternator may, therefore, be expressed as a function of the temperature of the ingoing air. This relation* is given in the accompanying table based on representative 25-cycle and 60-cycle machines. The load is based on a fixed maximum temperature attained by any part of the windings. Since 25 deg. C. (77 deg. Fahr.) is a standard air temperature for electrical machinery, the load at this temperature is taken at 100 per cent.

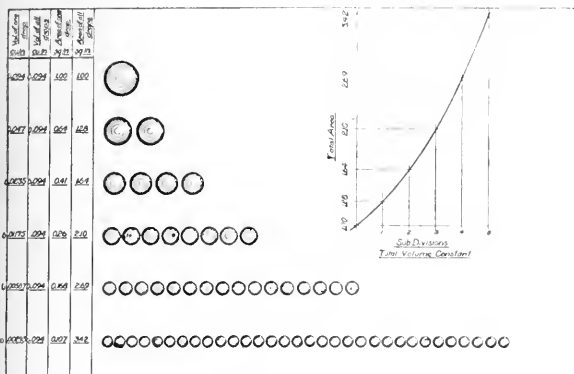

The cooling which can be obtained by the use of air washing and cooling equipment varies with the make

*Curve given in *General Electric Review*, September, 1913.

type of washer. For use with electrical equipment washer should be capable of reducing the temperature of the entering air at least 85 per cent of the initial wet-bulb depression. Table II shows the cooling effect with washer of this class, using some of the higher temperatures given above, with different humidities. It is possible, therefore, with this class of washer

hot months it would, therefore, be necessary to do one of three things, (1) install air washers; (2) increase the size of the electrical end of the units, or (3) install a spare unit. For illustration it is sufficient to compare the first two.

Each of the 10,000-kw. machines would require a washer of 40,000-cu.-ft.-per-minute (1120 cu.-m.-per minute) capacity, and the total cost of the three wash-

When about to purchase an air washing and cooling apparatus for this service, there are several items which, from an engineering standpoint, should not be overlooked. Merely to ask for a quotation on a washer of a certain capacity is comparable to asking for a quotation on a pump capable of handling a definite quantity of water, without regard to type, efficiency, speed or materials of construction.

CHARACTERISTICS WHICH SHOULD BE REQUIRED IN AIR WASHERS

In order to be efficient as regards both cleansing and cooling, and properly constructed, it is of prime importance that:

(1) The washer be provided with nozzles or other means of spraying the water, so that it will be finely atomized. The smaller the individual drops composing the spray, the greater will be the exposed surface for a given quantity of water. Therefore, both the cooling, due to evaporation, and the cleansing, due to the larger number of falling water particles, will be greatly increased.

(2) High pressures should be avoided, and the centrifugal pumps used for recirculating the spray water

FIG. 4—ACTUAL INSTALLATION OF AIR WASHER USED IN CONNECTION WITH TURBO-GENERATOR

should be designed for high efficiency, so that the expenditure of power will not be excessive.

(3) The spray chamber should be completely filled with a dense mass of fine spray. Water curtains, or contrivances producing sheets of water, should be avoided, as, in order to pass, the air must necessarily punch holes in the sheet, which means that a considerable proportion of the air will not be properly cleaned or cooled.

(4) Means should be provided for completely eliminating all free moisture from the air before it leaves the washer. This should be accomplished without the use of heater coils.

(5) The materials used in the construction of the washer, as well as the workmanship, should assure long life. This requirement is met in one type of washer by using nozzles of bronze, screens of copper, casing and water box of heavy galvanized iron; eliminator plates, galvanized after fabrication; piping, galvanized; pump, bronze-fitted with inclosed impeller.

(6) The drop in air pressure through the washer should not be excessive. The allowable resistance measured at the inlet end of most generators is $\frac{1}{2}$ -in. (1.27-cm.) water gage, and the drop through the washer should therefore not exceed this, or the amount of air which can be handled will be diminished. The exact air requirements are usually given in the generator contract specifications or can be obtained from the manufacturers.

By way of further explanation, it may be added that the spray chamber should be of proper depth and the velocity of the air low enough to allow sufficient time for contact between the air and water spray. Obviously, the more efficient the nozzle, the higher the permissible air velocity, and consequently the more compact the air washer. Economy of space is of great importance in power plant work. Nozzles which produce a full conical spray of finely divided particles of water at medium operating pressures are well adapted for this class of work. Spray-atomizing screens are used advantageously on one of the well-known makes of washers in order to increase the atomization of the water.

Not long ago there were very few, if any, water-spray-type air-conditioning outfits used in connection with the ventilation of electrical machinery. To-day there are several hundred power plants in this country equipped with air washing and cooling apparatus, including practically all of the large well-known stations. The resulting gain in efficiency and capacity, the saving in maintenance and the longer life of the machines to which they are attached make the installation of air washers inevitable in all progressive and up-to-date power plants.

NEW ELECTRIC FURNACES FOR MAKING FERRO-ALLOYS

One Rated at 3000 Kw. Is Being Tested on San Francisco Bay, and Another One Is to Be Placed in Operation Very Soon

A 3000-kw. furnace is being tested out at the Pacific Electro-Metals Company plant, completed recently at Bay Point, near San Francisco. It is expected that another furnace of equal capacity will be added within a few weeks, so that together with the incidental load a total of about 7000 kw. will be utilized when the work is in full blast. Pending decision of a suit for lower rates which is being heard before the California Railroad Commission, the Great Western Power Company is supplying service on a rate amounting to \$40 per horsepower-year. This is based on a guarantee of 90 per cent power factor and subject to readjustment on a kilovolt-ampere basis if the power factor falls lower. Energy is measured at 22,000 volts and the rate of \$4.44½ per kilowatt-hour per month is charged on the basis of the average power consumption for the fifteen-minute period in which the demand is the maximum. The contract also restricts the conditions under which the load shall be used. There is to be a 10 per cent limit on the load between phases. The plant is supplied by a 22,000-volt, three-phase line about 14 miles (22.5 km.) long from the Clayton substation, which is supplied by the 100,000-volt line from the Big Bend generating plant, 125 miles (201 km.) distant.

ELECTRICITY FACILITATES COAL HANDLING AT CAMP

Description of Machinery That Not Only Saves \$100 per Day, but Takes Care of Bigger Load with Less Help

Electrically operated machinery saves over \$100 per day in coal handling at Camp Devens, Ayer, Mass., one of the cantonments of the National Army. During the recent severe weather the daily coal consumption of the cantonment was about 800 tons, and the problem of distributing the fuel through the camp is no small one. Camp Devens was designed to accommodate about 42,000 troops.

Coal is brought to the camp by rail and discharged upon the ground by gravity from a trestle of the Boston & Maine Railroad about 450 ft. (137 m.) long at the easterly side of the cantonment. A general view of this trestle and of three electric loading machines is shown in Fig. 1. A fourth machine, of the electric shovel type, is at present behind the trestle, on the other side of the storage pile, and is shown in Fig. 2. The coal-

FIG. 1—GENERAL VIEW OF MACHINES

handling contract within the cantonment is held by C. E. Hall & Sons, Inc., of Revere, Mass., who schedule the movement of fuel from the ground storage pile to the fourteen boiler plants in camp, using fifteen 5-ton and 6-ton gasoline motor trucks for delivery. The average round trip of each truck is 3 miles (4.8 km.), and about fourteen round trips are made daily per truck. Normally trucks are in service from 7 a. m. to 10 p. m.

A "close-up" view of one of the electric loading machines grouped in Fig. 1 and discharging into a 6-ton Hurlburt truck is reproduced in Fig. 3. These loaders were built by the Conant Machine Company, Concord Junction, Mass., and each has a capacity of about 30 tons per hour. Energy is supplied at 220 volts from a bank of transformers connected with the cantonment supply circuits, these being fed through a substation connected with a 66,000-volt line of the New England Power Company. Each loader is gear-driven by a 5-hp. Westinghouse three-phase induction motor mounted on a frame and housed in a sheet-iron box providing easy access for inspection. The motor speed is 1750 r.p.m., and a reduction to about 350 r.p.m. is obtained through the pinion and gear to the main driving shaft, from which a Griplock chain drive is provided to a wheel and shaft that provides the drive for the buckets.

The buckets are 8 in. (20.3 cm.) deep, 8½ in. (21.6 cm.) wide and from 16 in. to 18 in. (40.6 cm. to 45.7 cm.) long, depending on the size of the machine. About twenty buckets are required per machine. The machines weigh from 2800 lb. to 2 tons (1270 kg. to 1840 kg.), according to size, and are easily moved about to

FIG. 2—ELECTRIC SHOVEL AT WORK

different portions of the coal pile. A flexible cable connects the motor in each machine with an appropriate terminal box or outlet on the trestle.

The electric shovel shown in Fig. 2 is of the Thew type and handles about one-fourth of the daily tonnage. It is designed for revolving service and is self-propelled. Energy is supplied through a flexible cable, the machine being operated by a 20-hp. Westinghouse induction motor. A 6-ton truck can be loaded in about five minutes with this equipment. The best day's work of the four electrically driven machines at the Camp Devens coal-reclaiming yard to date is 1056 tons. Formerly 150 men were required for this work and the maximum tonnage handled in one day was 750 tons by hand, and with motor truck distribution. At present three men are used on the shovel, one being an operator, who receives

FIG. 3—"CLOSE-UP" VIEW OF LOADING MACHINE

91 cents per hour for forty-four hours per week and double rates for overtime. The loaders require one, two or three men each for the most rapid feeding, and the whole force now is composed of only about twenty men. The capacity of the ground storage is about 50,000 tons.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

LOCATING TROUBLE IN MOTOR-GENERATOR SET

Generator Was Being Motored Owing to the Clamp of Two Bottom Series-Field Coil Interconnections Working Loose

BY E. C. PARHAM

That all battery-charging circuits should include a reverse-current circuit breaker to prevent the cells from motoring the generator should the generator voltage fall below that of the cells is shown by the following incident: A motor-generator set after being connected to some batteries all night appeared to be unable to charge the batteries. The set was found to be running at a reduced speed with circuit breaker open. The accompanying diagram indicates the connections.

The set was shut down by pulling the knife switch and the generator was carefully inspected. The series field-coil interconnections were of the clamp type and the clamp of the two bottom coils had worked off, there-

CONNECTIONS OF MOTOR-GENERATOR CIRCUIT

by opening the series winding and making it necessary for the series-field shunt to carry the total current. Had there been no series-field shunt, the loosening of the clamp would have opened the circuit between the generator and the battery and there could have been no motoring action.

As it was, however, the cutting out of the series winding lowered the voltage of the generator to a value that was below that of the battery and the shunt held intact the circuit that was necessary for the motoring. Up to the time of the opening of the motor breaker the driving motor and the battery had been operating the set in the same direction.

Emergency Temporary Repair for Plain Grate

Recently in a small Middle West power house where it was not possible to secure plain grates owing to delays in deliveries, etc., temporary grates were constructed of 2-in. (5-cm.) and 3-in. (7.5-cm.) pipe sawed to the proper length. This makeshift repair tided the plant over the period of railroad congestion and maintained steam-heating and electric service until the repair parts which were in transit arrived.

A MOTOR-DATA SHEET FOR INDUSTRIAL PLANTS

All the Important Data Concerning the Installation of Each Motor Are Included in This Comprehensive Record

To avoid the usual lack of complete data bearing upon motor applications in industrial plants, a Massachusetts factory uses the form reproduced herewith. On a sheet 8½ in. by 10¾ in. (21.5 cm. by 27.3 cm.) in size all the more essential data are listed, including the factory section, department and floor on which the

COMBINED MOTOR ORDER AND DATA SHEET FOR USE IN INDUSTRIAL PLANT

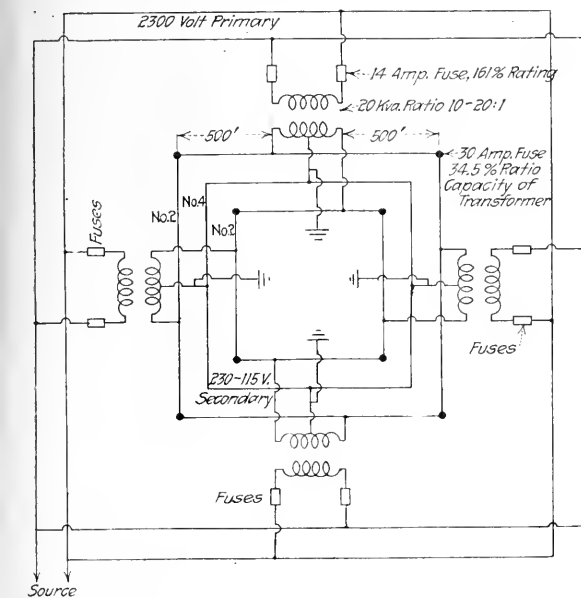

motor is going, speed, pulley and suspension or mounting details, type of covers, make recommended by drafting department, type of controller and shipping directions.

On the original order it has not been customary to fill in more than the necessary information for the motor maker and control manufacturer, but the complete information desired by the plant is kept on the filed sheet, which is convenient in its provision for all the important facts.

ECONOMICAL PLAN OF FUSING INTERCONNECTED SECONDARIES

Placing Fuse at Neutral Point Between Transformers and Choosing Fuse Rated at 30 per Cent of Transformer Is Recommended

In discussing the advisability of fusing interconnected transformer secondaries on a single-phase distribution system, M. E. Grah of the Toledo (Ohio) Railways & Light Company expressed the opinion before a meeting of the distribution committee of the Ohio Electric Light Association that fuses should be

BANK OF FOUR TRANSFORMERS WITH INTERCONNECTED SECONDARIES FUSED AT NEUTRAL POINTS

used. If the secondary is not fused, said he, the primary fuses of all transformers will probably blow in case any transformer fails. When this happens it will be impossible to energize the bank again until the secondaries are sectionalized. Moreover, if a primary fuse is blown and the secondary network is alive from other transformers, the transformer which is in trouble is "alive" and should not be inspected until its secondary has been disconnected. These have been the great objections to banking transformers.

Having decided to fuse the transformer secondaries, the next question to settle is the location of the secondary fuses. If the secondary fuses are placed at the transformers, some saving in time is made in getting at the transformer for inspection in case of trouble. It is Mr. Grah's opinion, however, that this method of fusing does not obtain the results desired from fusing and requires the use of fuses of such size as to be too costly for the benefits derived. A better arrangement can be secured by fusing the primary of the transformer for about 150 per cent of its rating and placing a fuse rated at about 30 per cent of the rating of one transformer at the neutral point between the transformers of the bank.

For an example consider the layout shown in the accompanying diagram. Here are shown four 20-kva., 2300/220/110-volt transformers with interconnected secondaries. In the primary 14-amp. fuses are used as the standard size, giving nearly 150 per cent of the transformer rating. In reality the 14-amp. fuse gives

161 per cent of rating. This permits the 80-kva. transformer bank to deliver a total maximum rating of 128.8 kva., or 32.2 kva. per 20-kva. unit, or 140 amp. at 230 volts. The full-load rating of each transformer is 87 amp. at 230 volts, and with the load divided equally at the transformer this allows 43.5 amp. each way from the transformer. By assuming the transformers to be 1000 ft. (304.8 m.) apart and that the neutral point is just half way between them, it can be decided to install these fuses in the outside wires rated at 30 per cent of the rated capacity of the transformers. This will permit an interchange between transformers of 30 amp. or 6.9 kva. Such an interchange may appear small, but in case of failure of one of the transformers this fuse is designed to blow before permitting either of the adjoining units to become overloaded more than 134 per cent.

To prevent trouble from accidental grounds, Mr. Grah recommends grounding the neutral of the secondary on poles adjacent to transformer poles if primary lightning arresters are installed on transformer poles, or on the transformer poles themselves, if possible.

EMERGENCY SWITCHING AND COMMUNICATING SCHEME

Used to Advantage in the Repair or Rebuilding of Transmission Lines Which Cannot Be Worked on While Alive

A switching and communication scheme which may be used to advantage during line repairs or rebuilding is illustrated herewith. It is particularly applicable to the reinsulating of loop lines of from 11 kv. to 22 kv. which cannot be worked on while "alive" and which have such characteristics that, while one arm of the loop is adequate to carrying the day load, both branches must be placed in operation each evening.

As will be seen from the diagram, a small transformer with indicating lamps is placed just inside of each of the switches which cut out the section to be worked on. Two lamps are used to insure against failure, and the transformers are not fused, to eliminate incorrect signals due to a blown fuse. In addition, a branch line switch is installed at each point. Two terminals of this switch are used to short-circuit and ground one phase of the line; the other cuts a telephone into the circuit.

DIAGRAM OF CONNECTIONS FOR COMMUNICATING SCHEME

In the morning the foreman of the repair crew proceeds to one switch and a patrolman or the foreman of a second crew to the other. Each opens his line switch on arrival, and when the second has been opened the lamps at both points go out. Each then throws in the short-circuiting switch and after waiting two minutes they communicate by telephone and the fore-

man receives a definite report that the other switch is open. At night the procedure is reversed; at an appointed time the men communicate by telephone and each reports all men clear. They then hang up, open the short-circuiting switches, wait two minutes and then close the line switches. Even should an incorrect lamp signal be given by the coincidence of failure of energy on the line while one man is waiting in the morning, no accident beyond the shutting down of the line will occur, since the line is not worked on unless short-circuited and grounded. This system is obviously unnecessary where commercial telephones are available near each switch point.

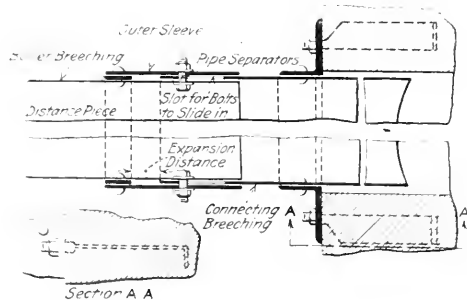

EXPANSION JOINT USED IN SMOKE BREECHING

Reasons Why This Type of Joint Is Best in a Long Breeching Which Is Designed to Serve a Number of Boilers

BY T. W. REYNOLDS

Without some provision for expansion and contraction, the breeching will in course of time leak at joints and uptakes with detriment to the proper draft. More particularly is this true of its connection to the chimney opening, at which point the breeching is riveted to angles which are in turn secured by anchor bolts to the brickwork of the chimney. Intermittent operation, forcing of boilers and the extremes of temperature changes will soon force an opening at this point and draw the anchor bolts from their fastenings. Therefore a long breeching serving a number of boilers should have an expansion joint next to the brick chimney, particularly when the connecting portion to the chimney is exposed to the weather and not covered.

In the construction illustrated the breeching, usually of No. 10 gage, is terminated at a point near the chimney and provided at this end with an outer sleeve of $\frac{1}{4}$ -in. (0.6-cm.) iron, $10\frac{1}{2}$ in. (26.7 cm.) in length. At the boiler end of the sleeve a continuous-distance piece of 2-in. by $\frac{5}{16}$ -in. (5-cm. by 0.7-cm.) iron is riveted on 4-in. (10-cm.) centers to and between the breeching and sleeve. This forms a space entirely around the breeching, $\frac{5}{16}$ in. by $8\frac{1}{2}$ in. (0.7 cm. by 22 cm.) in length, into which space is fitted a breeching of $\frac{1}{4}$ -in. (0.6-cm.) thickness connected at its other end through

DETAILS OF JOINT FOR EXPANSION AND CONTRACTION

the chimney opening. The boiler breeching, being free to move, slides as a hollow piston inside of this latter breeching for a maximum distance of $2\frac{1}{2}$ in. (6.5 cm.), this being the distance fixed by the construction as shown herewith.

The connecting breeching and outer sleeve are se-

cured together by bolts with washers under the head and with pipe separators as distance pieces around the bolts. The bolts slide in the slots cut out in the connecting breeching, their movement being equal to and dependent upon that of the boiler breeching.

CABLE RACKS DESIGNED FOR UNDERGROUND SERVICE HOLES

Eliminates the Use of Junction Boxes—Cables Are Fanned Out and Passed Through Insulators—Cost Saving

Hand-holes have been provided between manholes on the underground system of the Knoxville (Tenn.) Railway & Light Company to facilitate service taps and inspection. Ordinarily expensive junction boxes are

RACK WHICH ELIMINATES USE OF JUNCTION BOX

provided in all hand-holes, but in the Knoxville system these junction boxes are eliminated, the cables being fanned out and passed through insulators, as shown in the accompanying diagram. All service connections are made by soldering directly on to the cables and taping the joints. This construction reduced the cost one-eighth and has proved thoroughly satisfactory in operation.

INTERESTING POLE-SETTING RECORD OF WESTERN COMPANY

1503 Poles Set Over 35.5 Miles of Line and Three Villages at an Average Expense of 26.5 Cents per Pole

The Dakota Engineering & Construction Company, which is at present engaged in the erection of a high-tension transmission line from Valley City, N. D., to supply a group of small outlying villages, claims that during the last season its men set seven 60-ft. (18.3-m.), thirty 40-ft. (12.2-m.), 124 35-ft. (10.7-m.), 1222 30-ft. (9.1-m.) and 120 25-ft. (7.6-m.) creosoted Western cedar poles, a total of 1503 pieces, over 35½ miles (57 km.) of line and three villages, at a total cost of \$398.85, an average of 26½ cents per pole. The crew consisted of six men including the foreman. The foreman received \$4.50 per day and the laborers \$3. On the high-tension lines in the country it was common for this crew to set from eighty-five to ninety 30-ft. poles per day, an average in spite of the high wages of only 21 2/3 to 23 cents each.

The poles were set, lined and tamped, having been placed near the holes previously. All 40-ft. (12.2-m.) poles and lighter ones were set with four pikes, larger poles by means of block and tackle. In no case were more than six men used on the pole-setting crew. It might be mentioned, in addition to the above, that each pole carried a 25-lb. (11.3-kg.) iron wishbone arm when raised.

RATES FOR THAWING

FROZEN WATER PIPES

New York Company Has Derived a Revenue of \$895
During the Past Winter from
This Work

H. K. Stein, superintendent of the Genesee Light & Power Company of Batavia, N. Y., commenting upon the article on rates for thawing frozen water pipes in the Feb. 16 issue of the ELECTRICAL WORLD, page 363, writes as follows:

"The Genesee Light & Power Company has been thawing pipes by electricity for some time past and has charged for its service on a different basis from that noted in the article concerning the practice of the company at Binghamton, N. Y. The Genesee Light & Power Company makes a charge of \$5 for an 0.75-in. (1.9-cm.) pipe and an additional charge of \$5 for each 0.25-in. (0.63-cm.) increase in size. Up to the present date the company has thawed 152 water services varying in size from 0.75 in. (1.9 cm.) to 3 in. (7.6 cm.), with a resultant revenue of \$895. This shows an average revenue per service thawed of \$5.88 per service." [See also ELECTRICAL WORLD for March 2, page 467.—EDS.]

ELECTRIC RANGE BUSINESS

GROWING IN SMALL CITIES

An Analysis of the Range Situation Shows the
Smaller Towns to Be Taking Up This Load
Actively with Good Success

While in the large cities central stations may not expect to push ranges this year, they will in the great majority of cases continue to sell them. The usual amount of publicity will probably not be given to the range business, but sales will be made quietly as a matter of routine. This, in fact, is going on at the present time. But in the small towns and cities there is a different outlook on the range business.

For purposes of analysis these smaller communities can be placed in two classes—first, those owned and operated by holding companies; second, those owned and operated by local capital. It seems probable that there will be less activity in the former group than in the latter. This is a natural consequence of the present financial situation, in which borrowing capital is a difficult process. The companies owned locally do not encounter so much of this trouble as others because their sources of capital have not yet been subject to such severe drains as have the central markets. Moreover, some locally owned companies have in general been less forward in making rates for electric cooking and in establishing twenty-four-hour service than other companies. The backward companies, seeing an opportunity on account of the high cost of domestic fuel to get range business easily, are making cooking rates. It

is true that in some cases they are looking at the revenue from cooking as an additional source that need not necessarily bear so much of the fixed cost as business already existing. But nevertheless the rates are being inaugurated, and these newly opened towns are providing this virgin territory for the range salesman to work. If it is found that time payments are essential to the success of any of these small-town campaigns, it is felt that there will be little difficulty in getting the money to carry the accounts. The operations of the Morris plan banks have opened the eyes of nearly every small-town banker to the possibilities of making money out of handling accounts of this nature.

Tangible evidence of the correctness of this analysis has been secured by the Hughes division of the Edison Electric Appliance Company. A circular letter was sent to a large mailing list of central stations, and inclosed therewith were a small envelope stuffer on ranges and a return post-card order blank for ordering either ranges or advertising helps. It was expected that there would hardly be any range orders, but it was thought that there would be calls for advertising helps from the cards. At the end of eight days after the letter had gone out the company had replies from eighteen companies in different states, and the replies included actual orders for \$985 worth of ranges. But the most interesting fact about the results of the letter is that the replies came mostly from communities that had never before been known as range markets. As indicating the character of the communities to which the letter and the range business appealed, a list of some of the towns is given: Zionsville, Ind.; Great Barrington, Mass.; Kalispell, Mont.; Albany, Ga.; Elma, Iowa; Deansboro, N. Y.; Froid, Mont.; Williamsburg, Ky.; Bloomville, Ohio; Earling, Iowa; Liberty, Mo.; Intercourse, Pa.; Oak, Neb.; Norton, Kan.; Clinton, N. C.; Salt Lake City, Utah; St. George, Utah; Armstrong, Iowa; Clearwater, Fla.; Boonville, Ind.; Portland, Me.; Portsmouth, Ohio; Lamon, Iowa; Gillespie, Ill.; Midland, Tex.; Huntington, Mass.

THE DIFFICULTY IN HANDLING APPLIANCE PAYMENTS OVERCOME

A Special Colored Coupon Is Attached to the
Monthly Bills of Customers Having an Open
Account for Appliances, Thus Saving Work

Trouble has been found by cashiers of utility companies in taking care of payments on account for special campaigns where these payments were included with the regular bill for meter service. In order to eliminate this difficulty, the Rochester (N. Y.) Railway & Light Company, in one of its special appliance campaigns recently, issued a special colored coupon which is attached to the regular monthly bill of any person who bought one of the appliances in that campaign. When the cus-

Consumer pays his bill for service and also for the appliance the cashier stamps both bills paid in one operation, tears off the special colored slip and places it on a separate file.

RUBBER STAMPS SAVE EXPENSE IN BILLING

Company with Sliding-Scale Rate Does Billing Now in One-third Time Required for Industrial Calculations

The Consumers' Electric Light & Power Company of New Orleans has just introduced a system of rubber stamps to save some of the clerical work entailed in making out its several thousand monthly bills. Under the company's rate lighting service is figured on a sliding scale and a great deal of calculating is required in figuring the bill totals each month. To make out a bill for 300 kw.-hr., for instance, it has been necessary to list five amounts and the total, including, first, the service charge of 25 cents; second, the first 20 kw.-hr. at 8 cents; then the next 30 kw.-hr. at 7 cents; then the

allowed for prompt payment, a simple matter as 1 cent is allowed for each kilowatt-hour consumed during the month.

It has been found that the use of these stamps makes it possible to do the billing in one-third of the time formerly required, and with considerable more neatness, besides minimizing the element of incorrectness in totaling. General Manager Aicklen recommends this system to other managers and offers to send a full set of impressions from these stamps to any one who desires them.

SUCCESS WITH GIRLS HIRED AS METER READERS

Colorado Utility Finds that They Are More Accurate than Men, Besides Making a Better Impression Upon Housewives

While there has been some hesitation about employing girls or women as meter readers owing to the inaccessibility of some meters and the condition in which cellars are frequently kept, some companies are finding the employment of women in this connection very satisfactory.

The Arkansas Valley Railway, Light & Power Company of Pueblo, Col., has during the last few months been employing young girls in the meter department as meter readers and has found them to be fully as competent and dependable as men in the number of meters read, and, according to Superintendent E. F. Stone, "if anything, more accurate."

Approximately 90 per cent of the meters in Pueblo are in the residence district, which enables girls to read a great percentage of the meters. The girls are limited to this district. The company employs one young man as a reader who handles the commercial and industrial districts and also acts as a relief reader.

The girls are furnished with a leather case in which to carry book and flashlight. They are also furnished with an identification card, as shown. They receive the same compensation as the men formerly employed at this work. They are reading on an average twenty-five meters per hour, work from four to five hours in the morning and read "strays" or are employed in the shop in the afternoon cleaning and repairing meters.

By reading the meters in the morning and using the girls in the shop in the afternoons the company finds the number of "strays" greatly reduced, as a greater percentage of the people are away from their residences in the afternoon.

When a girl is employed as a meter reader she is first required to serve at least a week or ten days in the

The image shows two examples of utility bills from the Consumers' Electric Light & Power Company of New Orleans. Both bills are for the same company, located at 116 BARONNE STREET. The top bill is for J. L. BAPTISTE, 4220 CLARA ST., and the bottom bill is for MRS. A. MOOS, 2420 GEN. TAYLOR. Both bills show a service charge of 25 cents and a total gross bill of 33 cents. The bills include a 'WE SELL' stamp and a 'W.S.S. WAR SAVINGS STAMPS' stamp. The bottom bill also includes a 'CASH DISCOUNT' section with a table of rates for different amounts of gross bill.

AMOUNT OF GROSS BILL	DISCOUNT
100	1%
200	2%
300	3%
400	4%
500	5%
600	6%
700	7%
800	8%
900	9%
1000	10%

HOW PUBLIC UTILITY USES RUBBER STAMPS TO SAVE BILLING EXPENSE

next 150 kw.-hr. at 6 cents, and the final 100 kw.-hr. at 5 cents. These extensions must then be totaled.

A careful analysis of the bills developed the fact that 80 per cent of the customers were using somewhere from 1 kw.-hr. to 300 kw.-hr. per month, and a series of rubber stamps were secured numbered from 1 to 300, each of which bears the necessary calculation to cover that consumption. So that by merely stamping the bill the fixed service charge of 25 cents, which is added to all retail bills, and all the items on the sliding scale are covered in one operation. The billing clerk has these 300 stamps before him arranged in a handy rack, from which he can easily pick the proper stamp with far less risk of error than in hasty figuring. The only figuring now necessary on the bill in pen and ink is the discount

shops cleaning and reading the shop meters. She must become efficient in reading shop meters before she is allowed to take a route.

The girls have met with little difficulty in obtaining admission to the homes to read meters. From com-

TEMPORARY RECEIPTS FOR GUARANTEE DEPOSITS

Brooklyn (N. Y.) Company Institutes New Method for Handling Customers' Deposits Collected by Salesmen

A new method of handling customers' guarantee deposits paid to collectors has recently been instituted by the Edison Electric Illuminating Company of Brooklyn, N. Y. Formerly it had been the custom for the collector to issue to the customer merely a memorandum receipt, very similar in character to the memorandum receipts which are commonly issued by banks in return for stock certificates left for transfer. It did not constitute a specific receipt for the amount of cash paid or cover the full details, but was followed by a formal receipt in detail which was forwarded to the customer from the office. The result was that salesmen, collectors and branch office cashiers experienced more or less difficulty with any customer who did not feel that he was properly secured for the money paid down and was unwilling to wait for the formal receipt to come by mail.

The new plan has put in force a system of temporary receipts which are issued to the representatives in books of a convenient pocket size containing fifty individual receipts serially numbered, each receipt providing a temporary customer's receipt, a cashier's coupon and a permanent carbon which remains in the book. Whenever a deposit is now paid to a representative of the company a temporary receipt is given, and this receipt states plainly that a regular deposit certificate will be mailed within five days from the treasurer's office.

A cashier's coupon is also made out, and it accompanies the money when turned in. The supply of books is under the control of the cashier, who secures the employee's signature when the book is issued and signs for the empty book when the receipts are used up. An

additional numerical control of individual coupons is secured by a system of tally sheets maintained by the cashier, on which he notes after each number the date the coupon was put through the records. It is a very simple method, requiring very little labor, and provides an absolute check against the proper receipt of every deposit which is paid to a representative of the company. The records of these deposits are kept on a series of cards that are operated by a tabulating machine.

Each book bears the name of the employee to which it has been issued on a special label which provides space for the transfer of the book to other employees. Careful instructions for the handling of these guarantee deposits are pasted on the cover of the book, as follows:

"Coupons and receipts should be written in ink. It is important that names, initials and addresses be correctly given. Legible carbon copies should be made on the duplicate (stub). Deposits turned over to branch office cashiers by agents should be receipted for on the duplicate. Deposits must be turned in to the company daily, accompanied by a correct copy of order. The space provided on the coupon for mailing address is to cover cases where party from whom deposit is received does not yet or will not reside at premises at which service is to be supplied. Consumers' deposit coupons are to be treated the same as cash coupons attached to electric bills. They are to be listed on the reverse side of collectors' 'daily collection sheets' under the heading of consumers' deposits, listing the number of the coupon as well as the amount of the total. This will constitute a permanent record of deposits turned in to the company and the receipt form attached to the collectors' 'daily collection sheet' should be properly made out by collectors and signed by person authorized to receive the money for the company. Collectors and branch office cashiers should carefully preserve all such receipts."

The new plan discontinues the practice of giving a self-addressed stamped envelope to customers paying deposits and provides a serially numbered temporary receipt to be held by customer until the permanent re-

ceipt is received, thereby saving a great deal of time formerly used in explaining why no receipt was issued for the money received.

Not only that, but it minimizes the opportunity of customers suspecting the company of trying to defraud them of their money. It is always easier to prevent trouble than to make explanations later to an irritated customer.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Notes on the Design of Electromagnetic Machines, Part III.—STANLEY PARKER SMITH.—In Part I of the article the author dealt with some of the main principles underlying the design of alternating-current generators. In Part II these principles were applied to the design of a low-speed, three-phase alternator, giving 750 kw. at 2200 volts when running at a speed of 250 r.p.m. In Part III the principles are applied to the design of a three-phase turbo-alternator to give 2000 kw. at 3000 r.p.m. at a line pressure of 5000 volts, and the mechanical stresses in the rotor are discussed.—*London Electrician*, Feb. 8, 1918.

Factors That Determine Maximum Rating.—F. T. HAGUE.—Commutation and temperature are the principal limitations to the ratings of direct-current machines, but the method of rating must be determined partly by the characteristics of the unit and partly by the service requirements. The limitations to rating may be considered as shifting, being extended as the knowledge of the theory involved is enlarged and as the skill in design and construction is improved. Most of the article is taken up with commutation limitations. Among the subjects discussed are commutator construction, maximum voltage, voltage per bar, flashing, maximum current, brush width, brush-current density, division of current between brushes, quality of brushes, armature reactance voltage, number of poles, and kw. versus speed.—*Electric Journal*, February, 1918.

Lamps and Lighting

Effect of Artificial Light on the Growth and Ripening of Plants.—J. L. R. HAYDEN and C. P. STEINMETZ.—A hitherto unpublished investigation of the application of electric light to stimulation of plant growth and fruition appears in the article. A description is given of the procedure, and the results are presented in the form of progressive photographs, tabulations and curves. Based upon these facts, the conclusions of the investigation show that under certain conditions electric light may be used with commercial success to accelerate the growth and development of plants.—*General Electric Review*, March, 1918.

Generation, Transmission and Distribution

The Unification of Frequencies.—ULISSO DEL BUONO.—The first installment of an extended study into this question, which the author purposes to discuss under four divisions: (1) Influence exerted by the alteration of frequency upon generating plants, prime movers and electrical machinery, and the modifications which ought to be made to enable machines to operate at a frequency different from that for which they were built; (2) influence of the alteration of frequency upon the lines, network and receiving stations and modifications necessary with a change in frequency; (3) general considerations upon cost and conditions of performance in

the case of new machinery constructed for a given frequency; (4) methods of bringing about parallel operation of networks with different frequencies and examples of plants which have changed the frequency.—*L'Elettrotecnica*, Feb. 5, 1918.

Design of Underground Distribution for Electric Light and Power Systems.—G. J. NEWTON.—The object of this article is to show each step necessary in the design of an underground distribution system such as is usually required in a medium-size city. The operating conditions and municipal requirements are different in every locality; it is impossible, therefore, to make any definite rules that will apply under all conditions. By assuming the average conditions met with in the smaller cities it is possible to show the fundamental principles of handling this work in a systematic manner. While systems may and do differ, still it is possible to design a system for any type of distribution if these principles are followed. Where costs are given they are based on normal conditions and should not be taken as being the present costs. They are used simply for comparison, however, and will be of value in that manner only, and if treated as percentage difference will apply under any reasonable conditions. Owing to lack of space, no tables have been printed in this article as they can be found in electrical handbooks.—*A. I. E. E. Proceedings*, March, 1918.

Water Power Our Electrochemical Salvation.—C. A. WINDER.—The author undertakes to show that at least 50 per cent of the water now passing over Niagara Falls could be quickly and cheaply diverted for power purposes without in any way detracting from their natural beauties. In view of the serious coal shortage and the urgent need of electrochemical products, he contends that it is the duty of Congress to enact legislation at once which will make available the great quantity of energy now being wasted.—*General Electric Review*, February, 1918.

Installations, Systems and Appliances

Advantages of Electric Cooking.—Facts culled from the *Bulletin* of the Swiss Association of Electricians concerning the report of a commission on heating and cooking apparatus. Holding that the higher price of electric ranges as compared with gas ranges is counterbalanced by their superior safety and cleanliness, it follows that the essential condition of electric service is a charge not greater than that for gas. The daily consumption of gas for cooking is from 0.3 cu. m. to 0.5 cu. m. a person and that of electricity from 0.80 kw.-hr. to 1.04 kw.-hr. a person, the higher figure including the heating of water. Therefore it is necessary to sell 2.4 kw.-hr. at the same price as 1 cu. m. of gas. Since with the war the price of gas has risen from 18 to 20 centimes to 30 centimes (6 cents) a cubic meter, electric energy should therefore sell for 10 to 15 centimes (2 to 3 cents)

per kilowatt-hour—a price at which it is already sold by some central stations. It is objected that in many cases the existing electric installations are not able to take on the increased load that a general adoption of the electric range would cause. Much, however, can be done by tariffs adjusted to encourage the use of off-peak energy for cooking purposes.—*Revue Générale de l'Electricité*, Jan. 19, 1918.

Electricity in Beet-Sugar Factories.—E. M. ELLIS.—The article gives a readily intelligible description of the processes involved in the production of beet sugar and explains how greater reliability and economy can be secured by electrification. The many illustrations show the simplicity and flexibility of electric drive.—*General Electric Review*, March, 1918.

Testing Electric Ignition Apparatus.—J. D. MORGAN.—In connection with the testing of electric apparatus—namely, magnetos and induction coils—it is required to measure the current in the high-tension spark circuit. Owing to the complex character of the current, the problem of measurement is a difficult one. At the present, the author points out, the problem appears to be incapable of complete solution, and the task of producing a practical instrument resolves itself into devising means which will give useful indications when subjected to the actions of different currents having the same general characteristics. Different types of thermal instruments and varieties of the same type give very different accounts of the same piece of ignition apparatus.—*London Engineering*, Feb. 8, 1918.

Electrophysics and Magnetism

Aluminum Bronzes.—An exhaustive study of these alloys, both ordinary and complex, with regard to their electrical and mechanical properties, fabrication and industrial use. The electric resistivity of the ordinary alloy grows according to the content of aluminum until $7\frac{1}{2}$ per cent is reached, after which it decreases. With 90 per cent of aluminum the resistivity approaches that of the pure metal. The temperature coefficient diminishes when the content of aluminum reaches 10 per cent. At 94 per cent it is virtually the same as with pure metal. The addition of minute quantities of aluminum to copper augments very sensibly the resistivity of that metal, but the addition of similar quantities of copper to aluminum hardly affects the resistivity of the latter.—*Revue Générale de l'Electricité*, Jan. 19, 1918.

Suppression of Hysteresis in Iron-Carbon Alloys by a Longitudinal Alternating Magnetic Field.—C. W. MAGGONER and H. M. FREEMAN.—Some remarkable experiments are described in which the disappearance of hysteresis was brought about by the action of an alternating magnetic field. It is possible, say the authors, that the explanation is to be found in the action of the eddy currents induced in the samples during magnetization. This point is being investigated further.—*General Electric Review*, February, 1918.

Units, Measurements and Instruments

A Recording Thermometer.—At the last meeting of the Physical Society Prof. C. V. Boys described a recording thermometer which is constructed to go into the case of a regulator clock. The thermometric element consists of a rod of ebonite within a glass tube. The differential expansion is determined by a pair of levers giving a movement of 1 in. for 10 deg. Fahr.

(2.54 cm. for 5.5 deg. C.). The drum carries an ordinary barometer chart and is driven at such a speed that a two-hour interval of $\frac{1}{8}$ in. (0.3 cm.) is passed in twenty-four hours. The drum is driven by friction by means of a cord. An alternative design on the same lines to go into a recording barograph was also given.—*London Electrician*, Feb. 22, 1918.

Some Factors Affecting Determination of Maximum Demand.—CHESTER I. HALL.—A concise review of the development of maximum-demand rate systems is given in the introduction. Following this is a discussion of the four general methods of measuring maximum demand. Meters for this purpose are segregated into two subdivided classifications, the corresponding types being named. What constitutes an equitable time interval over which to integrate demand values is given consideration. A companion article is to follow.—*General Electric Review*, February, 1918.

Telegraphy, Telephony and Signals

The Mechanics of the Pole Line.—WARD H. SNOOK.—The determination of the forces acting on pole lines by use of graphics, deductions which may be made and applied to practical pole-line construction, and drop-wire construction and sags are discussed.—*Telephony*, Feb. 28, 1918.

The Telephone in the World War.—H. T. CARROLL.—The author describes the important part the telephone performs in the operations of the various armies. The war-time use of the telephone in the United States is also described.—*American Exporter*, March, 1918.

Miscellaneous

Turbo-Rotor Cap-Rings.—R. ROBERTS.—Conclusion of article from previous issue. The author shows how the stresses in turbo-rotor cap-rings may be calculated for some commonly used designs and summarizes the points that should be considered when designing the cap-rings.—*London Electrician*, Jan. 25, 1918.

Rolling Mills and the Electric Drive.—L. ROTHERA.—The power installed in British steel and metal works for driving rolling mills is now well in excess of 300,000 hp. This represents only a very small percentage of the total power employed in these industries, however. The advantages which can be claimed for the electric drive are, the author points out, the economy of working, reduced space taken up, ease of control, constant check on the power consumed, increased output from a given plant, more uniform drive and smaller initial cost. In applying electrical methods to large reversing mills several engineering problems have had to be solved. One arises in connection with the design of the flywheel, which acts as a reservoir of energy and flattens out the constantly recurring peaks experienced in rolling-mill practice. In order to keep the weight of the wheel down to a minimum very high peripheral speeds have been employed, and to avoid the risk arising from internal strains it has been necessary to design a special type of built-up wheel to insure good balancing.—*London Electrical Review*, Feb. 15, 1918.

Switch-Gear Standardization.—C. C. GARRARD.—The author considers the various parts of switch gear which can, in the present state of the art, be standardized with advantage and suggests adoption of the American standard test pressures for switch gear, giving specifications for brass and gunmetal. The article is to be concluded.—*London Electrician*, Feb. 22, 1918.

Scientific and Industrial Research

A Department Devoted to Interchange of Ideas, Investigations Contemplated, Research Facilities Available, and Suggestions for Co-operative Work.

Conducted by PROF. VLADIMIR KARAPETOFF

Cornell University, Ithaca, N. Y.

CO-OPERATIVE RESEARCH BY WIRE AND CABLE MAKERS

They Purpose Investigation of Fundamental Nature of Dielectric Phenomena as a Foundation for Future Progress

At a recent committee meeting of the American Institute of Electrical Engineers Prof. Comfort A. Adams proposed a comprehensive system of co-operative research by manufacturers and others interested in the properties of insulating materials. He suggested that a committee be appointed consisting of representative experts in this field throughout the country who have facilities for carrying on research. This committee would lay out a plan of research, dividing the work between the various laboratories, and would meet periodically to compare results. In this way it is hoped that the fundamental nature of dielectric phenomena may be successfully investigated and a foundation laid for progress by all of the manufacturers participating.

The object of this committee would be to economize the efforts of the industry and to obtain results which are more thorough-going, comprehensive and commercially useful to them. Professor Adams said that he thought that this kind of co-operation will be necessary if we expect to compete with an organized nation like Germany after the war is over and that the organization of this committee will be the first step in one of the biggest movements for industrial supremacy. This plan has met with the approval of many manufacturers, and it is likely that the committee will be organized in the near future.

NEW RESEARCH LABORATORY IS ORGANIZED IN JAPAN

Provisions Made for Private Research, Dissemination of Information, Co-operation with Other Bodies and Training of Researchers

A new physics and chemistry research laboratory has been recently organized in Japan. It is a semi-governmental institution, part of the foundation being furnished by the government and the rest by private subscribers.

Several young scientists have been nominated as members of the staff, and some of them are at present in the United States studying laboratory methods. The noted physicist, Dr. Nagaoka, is the head of the physics department, and Dr. Ikeda is the head of the chemistry department. The object of the institution is to conduct original investigations in physics and chemistry and to apply the results for the promotion of industry. To accomplish these objects and to make the institution more closely related to the outsiders, the articles of in-

corporation contain the following provisions: (1) Private parties may apply for research to be done on specific subjects. (2) Outsiders may obtain permission to utilize the equipment of the institution. (3) Outside investigators may obtain assistance for completing their investigations or inventions. (4) The institution will publish the results of researches conducted in it. (5) The institution will provide public lectures for the dissemination of the results of its research. (6) The institution may confer honorary degrees upon those who have accomplished original research of merit. (7) The institution will conduct correspondence with other similar institutions of the world and co-operate with them. (8) The institute will undertake training of research men.

Investigations Under Way or Completed

(RESEARCH WORK REPORTED SINCE FEB. 16)*

CELLS, PRIMARY.

Investigations are being conducted to develop a primary cell that is light and practicable for use in connection with flash-lamps.—*E. J. Berg, Union College, Schenectady, N. Y.*

CORE LOSS.

An investigation and comparison of various methods for measuring the core losses in 2000-cycle transformers. Several methods were used for measuring the losses and the results compared.—*William B. Kouwenhoven, Johns Hopkins University, Baltimore, Md.*

CORONA, DIRECT-CURRENT.

An extensive study of direct-current corona has been made. Rectification of alternating current up to 45,000 volts effective has been accomplished with the corona tube in hydrogen. The effect of a hot wire on the corona discharge has been studied, and some very interesting facts have been observed. As soon as time allows, the research will be continued.—*Jacob Kunz, University of Illinois, Urbana.*

MAGNETIC HYSTERESIS CURVE.

Steinmetz's formula for hysteresis loss gives the integral value of the loop, but does not indicate the value of the hysteresis proper as a function of field strength or of induced magnetization. An attempt is being made to separate the three forces acting in magnetized iron, namely, field strength, magnetic tension and hysteresis. For any value of field strength their resultant determines the total magnetic flux density B . The hysteresis h for the upper branch of the loop seems to satisfy the following equation (similar equation holds for the lower branch): $h = A / \cosh(\phi - u)$, where $u = c(f + H)$, and $\cosh \phi = (1/\epsilon) \cosh \sqrt{a(b + u^2)}$. In these equations H is the field strength and A, c, f, a, b and ϵ are constants.—*Hans Lippelt, Brooklyn, N. Y.*

RESISTANCE TO THE GROUND.

With the usual methods of measuring the resistance between the ground and the earthing plates the result is vitiated by stray currents and by the emf. of polarization. The author has devised a method with which an ordinary Wheatstone bridge can be used with the addition of an adjustable emf. in the plate circuit. This latter emf. is set to compensate for that which exists between the plates and is due to the earth currents, electrolysis, etc., so that the bridge measures the true ohmic resistance of the ground connection.—*Shiro Sano, Tokyo, Japan.*

TRANSIENT VOLTAGES, SPARK GAP IN AIR.

Experiments were performed on the behavior of a needle gap and of a sphere gap connected across the high-tension terminals of a testing transformer. Instantaneous voltages up to 35 kv. were applied by suddenly exciting the low-tension side with direct current, and it was found that under these conditions a needle gap can stand considerably higher transitory voltages than are shown in the A. I. E. E. table for continuous application.—*P. H. Felker, St. Louis, Mo.*

Suggestions for Research

INDUCED EMF., THE NATURE OF.

If a cylindrical condenser moves parallel to its plates in a field with its induction parallel to the plates and perpendicular to the motion, it becomes charged; but if the magnetic field between the plates is given the same relative motion while the condenser remains fixed, the condenser receives no charge. The experiments are of necessity more complicated than the corresponding experiments on rotation, especially in requiring the use of a magnetic arrangement analogous to the electric guard ring.—*S. J. Barnett, Ohio State University, Columbus.*

RECTIFIERS, COMMUTATOR-TYPE.

Theoretical and experimental investigation of a commutator-type rectifier driven by a synchronous motor. It is desired to improve the commutation by means of choke coils, condensers, etc., and to reduce the brush friction and energy loss. Such rectifiers are now being placed on the market for garages and for electrolytic work. Further development for heavier currents is desired, having in mind the electrification of steam railroads.—*Editorial Suggestion.*

*The names of individuals given after each institution reporting investigations are those of persons with whom others interested should communicate. All institutions reporting research work should give such names.

Preventable Waste of Coal

To the Editor of ELECTRICAL WORLD:

SIR: With reference to the abstract from D. M. Myers' interesting paper on the above subject contained in your issue of Dec. 8 I think it may be of interest to your readers if I give some particulars of two devices which we have had at work for some time at the Deptford power station, London, and which have proved to contain great possibilities in the way of coal saving when applied to chain-grate stokers on which it is necessary that many and

FIGS. 1 AND 2—FIXED CLINKER DAMS NOT SUITABLE WHEN WIDELY DIFFERING COALS ARE USED

graded grades of fuel should be burned. Users of these coals will have noted their widely different burning characteristics on the grate. While, on the one hand, many classes of coal yield close-lying, compact coke, many others, on the contrary, tend to "spread" on the grate in more or less open formation with isolated patches and intervening bare spaces, the latter condition making necessary some form of clinker dam or dumping bar at the rear end in order to hold the coal back and maintain a compact fuel bed until combustion is completed. The dam or dumping bar in general use has hitherto been of the fixed type, two well-known forms of which are illustrated in Figs. 1 and 2. We have found, however, that these fixed bars have very considerable limitations, as made sufficiently high to bank up and retain efficiently the "spreading" masses of coal, the ash and clinker frequently as much as 30 per cent in the poor qualities of coal we are having to burn under present war conditions will not pass over but effect a segment on and in quite a short time choke up the grate, causing a serious loss in efficiency due to excess air admission and lowering of the furnace temperature. On the other hand, if

FIGS. 3 AND 4—ADJUSTABLE DUMPING BAR SET FOR SPREADING COAL AND CLOSE-LYING COAL

made sufficiently low to clear the ash refuse, the grate fails to retain the "spreading" coal, not only allowing large quantities of unburned fuel to pass over the rear end but also resulting in a large amount of excess air admission due to the open formation of the fuel bed.

To overcome this difficulty one of the devices referred to above has been adopted. It consists of an adjustable dumping bar, one design of which is illustrated diagrammatically in Figs.

Readers' Views and Comments

3 and 4. The dumping bars, of sectional type, pivot on supporting plates which make an air seal with a fixed "former" plate, this plate constituting the front side of the ash pit. The bearer bar carrying the sealing plate and dumping bar can be raised or lowered by hand, or preferably by means of a small hydraulic cylinder connected to the feed-water mains, the operating cocks being placed adjacent to the sight door at the rear end of the furnace. These dumping bars can therefore be set at the most suitable height for the particular fuel that is being burned, and should the accumulation of clinker require, it can be readily operated by merely lowering the bars for a few minutes until the debris has passed over, when they can be reset at the original or any suitable height. The main features of this apparatus are:

1. Flexibility of parts.

FIGS. 5, 6 AND 7—UNEVEN DISTRIBUTION OF COAL SOMETIMES OBTAINED ON GRATINGS

2. Wide angular rotation of the ash-receiving face.
3. Quick and ready renewal of parts.
4. Rocking or pushing back avoided.
5. Complete air seal in all positions.
6. Ease of operation.

The second device referred to above applies to the furnace door. One essential condition for good furnace ef-

Figs. 5 to 7. These irregularities or "legs," as the stokers call them, may be due to various causes, such as size and constitution of the coal, design of the chute feeding the coal hopper, or some feature in the design of the arch or furnace setting. It is also found that distortion and collapse of the type of guillotine door generally in use is not infrequent, more especially when burning fierce or highly volatile coals on a furnace setting which has been designed to give good front-end ignition with low volatile or low-grade fuels. We have found these difficulties almost entirely overcome by the use of the sectional adjustable door illustrated in Fig. 8, which it will be seen consists of a series of narrow doors suitably lined with firebrick and fitted with renewable shoes, each one separately and pivotally hung from a common bearer girder and individually adjustable, and so arranged that they may be collectively raised or lowered as required. Advantages of this design are, briefly:

1. Control of the fuel thickness and therefore of the distribution of the fire over the grate area.
2. Durability of parts.
3. Quick and ready renewal of burnt parts.
4. Freedom of working.
5. Effective air sealing.

The advantage of having the adjustment and flexibility of these two devices will, I think, be obvious to all users of chain or other traveling-grate stokers under any conditions of working with high or low grade fuels, but we have found them to be more particularly effective in greatly improving the efficiency of our boiler plant with the poor-quality coals we are at the present time having to handle. All who have had the experience of the unsatisfactory furnace conditions and poor efficiencies which usually are inseparable from a 25 to 30 per cent ash coal will, I think, realize the impor-

FIG. 8—SECTIONAL ADJUSTABLE GATE FOR INSURING UNIFORM FUEL BED

iciency is, of course, that the whole area of the grate up to the dumping bars should be equally covered by the fuel. Frequently, however, and more particularly in the case of the wider 8-ft. or 9-ft. stokers, the fire fringe assumes forms such as are indicated in

tance of an apparatus which can not only enable normally good efficiencies to be obtained but also show a marked improvement in steaming capacity.

Engineer and Manager, London Electric Supply Corporation, Ltd.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities in the Technical, Commercial and Manufacturing Fields

TIME TO PREPARE FOR THIRD LIBERTY LOAN

But Three Weeks in April Allowed—Speed Necessary to Make a Perfect Record—100 per Cent Subscription the Goal Set

With a definite date now set for starting the national campaign on the third Liberty loan—April 6—the campaign will be short and furious, only three weeks being allotted in which to obtain the required subscriptions.

Speed, therefore, is necessary, and it behooves every one to keep this factor in mind. Careful plans must be laid and every effort made to go well beyond the mark set.

In the first two loans the individual subscriptions, while large, were by no means so great as they might have been. The subscriptions in large blocks from the financial centers were the predominant features.

The third loan, however, demands a much wider distribution than either of the other two. The fifty-dollar and hundred-dollar subscriptions must far exceed their number in either of the two previous loans.

Consequently there is a direct obligation on the part of every employer to see that his employees have the opportunity to subscribe 100 per cent. Those in the electrical industry have backed the other two loans magnificently. Their efforts on these occasions, however, must fade into insignificance compared with what they are to do in the three allotted weeks in April.

To sell every employee a bond is the task set the industry. To help the industry in this work by the suggestion of how it can be done is the task of the ELECTRICAL WORLD. In these pages each week until the loan is pronounced a success will be found details of schemes that have proved their worth in previous campaigns, as well as cartoons, posters and other helpful material.

In order to make the third Liberty loan another thorn in the Kaiser's side manufacturers, central stations, jobbers, dealers, contractors, engineers, agents, etc., must begin *now* to lay the foundation for their campaign in their own shops, offices and plants.

PERSONAL SOLICITATION NECESSARY

First and foremost the first two loans taught one great lesson. Personal solicitation of employees is necessary—without it the maximum results cannot be had.

Bearing this in mind, therefore, the first thing to do is to organize the shop or plant or office into a committee or committees—preferably the foremen or department heads. They should be told exactly how it is proposed to sell to the employees, namely, whether the company will carry the account and, if so, on what basis. They should be educated, if they are not already so educated, on the fundamental idea back of the Liberty loans and their enthusiasm aroused. Enthusiasm is the keynote. Without it the solicitor will not be successful.

Other preliminary work will include procuring, if it

is not already at hand, a bulletin board at least 9 in. by 12 in. in size. Naturally this should be placed where the men are in the habit of gathering.

Subscription blanks and any other stationery also should be prepared ahead of time. Posters for hanging up in all the places that the men work or gather can be procured from the local Liberty loan committee and should be on hand and hung up when the campaign opens.

The ELECTRICAL WORLD is preparing two posters which will appear prior to the beginning of the national campaign and which will serve as original posters for bulletin boards. Besides, the ELECTRICAL WORLD is laying in a supply of stickers for letterheads, printed in three colors, which may be had for \$3 a thousand. These stickers are free from all except Liberty loan advertising.

Lastly, let the local committee help. Let no stone remain unturned. The goal set is 100 per cent subscription.

For several reasons the desire for greater distribution of the loan seems likely to be fulfilled. First, America is now very much in the war—*our* soldiers are holding long stretches of first-line trenches and consequently the national realization of the war is now much more acute. Second, the education on the first two loans will serve as a foundation for the third. Third, wage earners are in a better position than ever to save.

USE OF TRADE ACCEPTANCES URGED BY MANUFACTURERS

Committee of Associated Manufacturers of Electrical Supplies Shows that They Will Be of Great Value, and Governors Act

At a recent meeting of the board of governors of the Associated Manufacturers of Electrical Supplies the following resolution on trade acceptances was passed:

Whereas the board of governors of the Associated Manufacturers of Electrical Supplies has investigated by committee the general question of the employment of trade acceptances; and

Whereas the reports of such committee indicate that the general use of trade acceptances would be of exceeding value to the electrical manufacturing industry,

Resolved, first, that the board urge upon the membership of the Associated Manufacturers of Electrical Supplies the desirability of the immediate adoption in their respective businesses of the trade acceptance; second, that members not fully acquainted with the methods and processes employed be urged to communicate at once with the committee on trade acceptances and obtain the information necessary to a thorough understanding and ultimate adoption; third, that the committee consisting of Messrs. Eidlitz, Trumbull and Dustin be continued and instructed to extend by all proper methods throughout the electrical manufacturing industry the use of the trade acceptance; fourth, that a copy of this resolution be mailed to all members of the Associated Manufacturers of Electrical Supplies.

MINNESOTA ASSOCIATION IN WAR-TIME CONVENTION

Members Meet at Minneapolis Because They Feel
Need of a Conference to Consider Problems
Growing Out of the War

The first war-time convention of the Minnesota Electrical Association was held at Minneapolis on March 11, 12 and 13. The registered attendance was larger than it had been at any time before in the association's history. The members had expressed a desire for a convention as a war-time necessity and came to the meeting to learn how other companies are solving the new problems presented by war conditions. The keynote of the convention was conservation. Keen interest was displayed in papers and discussions on all plans for effecting true economies.

President F. A. Otto of Albert Lea departed from the usual type of presidential address and made several definite recommendations. He said in part:

Considering the question of holding a meeting this year, the board of directors of the association was unanimously of the opinion that the abnormal conditions caused by the war made it more necessary than ever to get members together for their mutual co-operation in maintaining the central-station industry at maximum efficiency.

The work of operating a public utility is becoming more and more difficult and the end is not yet in sight. Delays and inability to get fuel and the increasing cost of coal, as well as the rising cost of labor, have added materially to the operating expenses.

Difficulty in financing new extensions and securing new capital have added to the troubles; shortage of material, transportation delays, curtailment in lighting and power have all tended to reduce revenues of central stations. For these reasons and many others it seemed necessary to call members together.

The president then recommended that a fuel committee be appointed with the following objects:

1. To make a survey of the coal situation in the State as it affects public utilities. By this is meant to ascertain the amount of coal consumed annually by the public utilities and the monthly consumption, and to ascertain how much coal can be stored by each utility. This will show how much coal must be transported.

2. To co-operate with the State Fuel Administrator to secure the necessary supply of coal and to co-operate with railroad operators to keep coal moving regularly.

3. To give special assistance to association members who have difficulty in getting a sufficient supply of fuel.

Mr. Otto further urged emphatically that since the central stations are of first importance as a national asset in war time no effort should be spared to maintain them at maximum efficiency in spite of all difficulties. To this end he recommended that the work of the technical committee be enlarged so that any association member could secure assistance in maintenance.

S. B. Hood, superintendent of construction Northern States Power Company, presented a paper on proper grouping of transformers in an interconnected secondary network. This paper was a résumé of two articles on the same subject presented in earlier issues of the *ELECTRICAL WORLD*. Mr. Hood stated that the fuses which are essential to the success of his plan will be marketed soon by a well-known manufacturer.

The discussion indicated interest in this plan as a method of increasing the possible load a given distribution system can carry.

George A. Hughes, president Edison Electric Appli-

ance Company, delivered an inspiring address on how electricity can be used to conserve people and materials. He pointed to the wide difference between the two words "conservation" and "conservatism," the meanings of which are sometimes confused. "Conservatism" means "do not do anything new," while "conservation" means "hasten to do the new things to be constructive."

Mr. Hughes' paper was discussed by H. E. Young and George D. Shepardson, Minneapolis, and Leonard Peterson, Thief River Falls.

Other papers presented, of which more will be published in later issues, were: "Maintenance of Electric Meters," by George Hewitt, Minneapolis; "Iron Wire Transmission Lines," Prof. W. T. Ryan, Minneapolis, and "Minnesota Water Powers," R. D. Thomas, St. Anthony Water Power Company, St. Anthony Falls.

Officers for the ensuing year were elected as follows: President, B. W. Cowperthwait, Faribault; vice-president, H. E. Swanson, Rochester; secretary, Fred C. Hoffmann, St. Paul; directors, Emil Avelsdson, Litchfield, and H. E. Young, Minneapolis.

TENTATIVE A. I. E. E. PROGRAM FOR ATLANTIC CITY CONVENTION

Five Technical Sessions to Be Held at Annual Convention—Tentative Program Prepared for
the June Meeting

It has been decided to hold an annual convention of the American Institute of Electrical Engineers in Atlantic City, N. J., on June 26, 27 and 28, 1918. Five technical sessions are contemplated.

The tentative program for the annual convention was decided upon by the committee on meetings and papers at the regular meeting in Cleveland last week. The following papers are considered as convention possibilities and will be presented in the order named if they are submitted and accepted by the committee on April 25:

Wednesday, June 26, 2.30 P. M.—W. H. Cole, "Split-Conductor Cables—Balanced Protection"; E. B. Meyer, "Overhead Cables"; H. H. Cochrane, "Wood-Stick Insulators"; G. I. Gilchrist, "The Applications of Theory and Practice of Transmission Systems."

Thursday, June 27, 10.30 A. M.—C. T. Allcutt, "Lightning-Arrester Spark Gaps"; C. P. Steinmetz, "Oxide-Film Lightning Arrester."

Thursday, June 27, 8.30 P. M.—E. Kilburne Scott, "Nitrogen Fixation"; C. P. Steinmetz, "America's Power Supply"; D. C. Jackson and N. W. Alexander, "Education."

Friday, June 28, 10.30 A. M.—V. Karapetoff, "Charged Condensers"; C. L. Fortescue, "Method of Symmetrical Coordinates Applied to the Solution of Polyphase Network"; N. S. Diamant, "Flux Distribution in Alternators Under Sustained Short-Circuit Conditions and Different Loads."

Friday, June 28, 2.30 P. M.—J. J. Linebaugh and J. L. Burnham, "Protection from Flashing for Direct-Current Apparatus"; H. S. Osborne, "The Design of Transformers for Parallel Telephone and Power Circuits."

The meeting will open at 10.30 a. m. on Wednesday, June 26, with an address by the president, and an informal reception will be held at the Marlborough-Blenheim Hotel at 8.30 the same evening.

The committee on meetings and papers has decided to recommend to the board of directors to hold a joint technical session with the American Physical Society at the annual fall meeting at Philadelphia in October.

CLEVELAND A. I. E. E. MEETING WITH THE STEEL ENGINEERS

Standardization of Motors Evokes Lively Discussion
in Joint Meeting with Association of Iron and
Steel Electrical Engineers

The important topics discussed at the intersection meeting of the American Institute of Electrical Engineers at Cleveland, March 8, 1918, were "Motor Standardization for Steel Mills," "Selection and Control of Steel-Mill Auxiliary Motors," "Capacity of Rolling-Mill Motors" and "Underground Distribution for Electric Light and Power Systems."

At the evening technical session President E. W. Rice, Jr., of the A. I. E. E. and President C. A. Menk of the Association of Iron and Steel Electrical Engineers presided jointly. Both manufacturer and consumer were given the opportunity to discuss the problem of motor standardization in steel mills.

W. L. Snyder, chairman standards committee of the Association of Iron and Steel Electrical Engineers, made a plea to the electrical engineers to help standardize electric motors for the steel industry. Lantern slides showed the labor and expense involved in changing the type of motor on various machines. Size of bases of motors and distances between bolt holes vary widely, and new frame castings had to be placed on the machines shown on the screen to hold the motors in position. Mr. Snyder mentioned several reasons for the need of standardization. He quoted a letter from the Midvale Steel & Ordnance Company which stated:

"Of approximately 800 crane motors now in use in this plant, 400 are of one type, which we have chosen as a standard, the other 400 being of miscellaneous makes and types. For the 400 standard-type motors we require twenty-eight duplicates to keep them in operation, whereas for the 400 miscellaneous motors 116 duplicates are necessary. If all 800 motors were of the standard type, only forty duplicates would be necessary and a saving of 73 per cent in duplicates would be effected."

"There are approximately 1,000,000 motors in the allied steel industries to-day," said Mr. Snyder, "which require 200,000 spares, costing \$8,000,000. If the motors were standardized, only 50,000 spares would be needed and an investment of \$6,000,000 avoided."

The paper was discussed by T. E. Tynes, B. J. Beck, D. M. Petty, H. C. Cronk, E. Friedlaender, A. D. Nye, A. W. Cowles and President E. W. Rice, Jr. Mr. Tyne said that when crane motors are to be replaced, which is bound to happen in time, it is usually impossible to procure the same type of motor. Therefore the trolley systems on the cranes would have to be redesigned.

Mr. Becker told of the troubles he had experienced from a manufacturer changing two types of motors twice in ten years. There were several questions upon such points as the advantages of straight or tapered shafts and interpole or straight series motors that Mr. Becker thought ought to be settled before standardization was effected.

Mr. Petty pointed out that the engineers should thoroughly consider what standardization meant to the manufacturers as well as to the consumers, because additional expenditures would be necessary to enable the manufacturers to discard their present-type motors and adopt the standard.

Mr. Hess said that the Youngstown (Ohio) Sheet & Tube Company carries a stock of 244 different-size brushes for the 2500 motors in the plant, which involves an investment of \$50,000. If these brushes were of one type, a saving of \$32,000 to \$38,000 could be made.

Mr. Friedlaender startled the convention by asking "How are you going to do it? Who makes the best motors?" He pointed out that standardization would retard future improvement in design and said that it would be best for the engineers to standardize their opinions before trying to standardize motors.

Mr. Nye said that if the demand were great enough the manufacturer would have to supply a standard motor and that a motor should be designed and submitted to the manufacturers.

President Rice pointed out that the manufacturer is in favor of standardization methods because the producing cost is greatly reduced. But he thought that standardization should come by evolution and not by revolution. He suggested that a committee of engineers be appointed to develop a standard and that manufacturers should be allowed to attend these meetings and advise concerning the design.

SELECTION OF STEEL MILL AUXILIARY MOTORS

In a paper entitled "Selection of Steel-Mill Auxiliary Motors and Control as Affected by Mechanical Features of the Drive," J. D. Wright showed illustrations of complete electrically equipped steel mills. He explained the function and operation of manipulators for blooming mills, which consist of side guards and lifting fingers. Traveling tilting tables were shown, and Mr. Wright pointed out the necessity of having motors reversible and with solenoid control for inching work.

In the discussion that followed the presentation of the paper it was generally held that rolling-mill motors should be of the high-speed series type instead of the special low-speed machine, because the series motor is more easily controlled. It was pointed out that more clearance was needed on the side guards in the mill housing of rolling tables. That a buffer resistance instead of a jam relay should be used on the side guards, because the jam relay does not have time to act, was contended by several speakers, but Mr. Wright, in closing the discussion, stated that the machine in question had been originally equipped with a jam relay which had to be discarded as being unsatisfactory.

CAPACITY OF ROLLING-MILL MOTORS

"Some Considerations in Determining the Capacity of Rolling-Mill Motors," by R. F. Hamilton, was presented by W. Sykes somewhat briefly because of the mathematical calculations involved in the paper, which held that classification of motors, mathematical determinations of energy required for rolling, relation of speed to tonnage, motor capacity and flywheel application should be thoroughly studied in the application of electric drive to rolling mills.

In closing the discussion Mr. Sykes stated that the designer should start with the idea of what he wants to roll. He emphasized the fact that the motor should be used in the type of mill for which it is designed and that all calculations for capacity should be made with ultimate needs in view.

That rolling-mill motors should be designed for reliability as the chief consideration was the main thought

the discussion. If a steel mill is shut down for an hour, a large loss is entailed, and therefore continuous operation should be considered first. It is not the manufacturer's duty to design the correct type of motor, but the industrial engineer should tell exactly what is wanted because he knows the conditions of the plant.

UNDERGROUND ELECTRIC DISTRIBUTION SYSTEMS

The complete design of an underground system was described in a paper by G. J. Newton entitled "Design of Underground Distribution for Electric Light and Power Systems." The author realized that all systems differ and that it would be impossible to make definite rules that would apply under all conditions. He made clear, however, what information is necessary and told how, after getting that information, the design should be made.

The paper was discussed by A. A. Myer, G. N. Rakestraw, H. T. Wallau and E. Friedlaender.

Mr. Myer told of the direct-current underground system used in Detroit and pointed out that the load density was an important factor involved in the design of an underground system.

Mr. Rakestraw recommended the use of varnished fabric insulation for underground cables instead of paper in spite of the fact that paper is more economical. He also advised against the use of a bare-wire neutral connection to ground in an underground system. Mr. Friedlaender told of the troubles of an underground system in steel mills because of maintenance. If a break occurs, it can be more easily and quickly remedied on an overhead line than on the underground system.

ANNUAL MEETING PLANS OF ASSOCIATED MANUFACTURERS

Convention on March 21 in New York Will Include Afternoon Business Session and Banquet in the Evening

As stated in last week's issue of the ELECTRICAL WORLD, the annual meeting and banquet of the Associated Manufacturers of Electrical Supplies will be held at Delmonico's, New York, on Thursday, March 21.

The business session is called for 2 p. m., for election of governors, presentation of reports, etc., and for consideration of international trade conditions after the war, trade acceptances and their advantages, the work of the war service committees and many other matters of interest.

The evening session, with a banquet, to which members may invite guests, will be a social session, in the ballroom of Delmonico's, at 7.30 p. m., and will be strictly in keeping with the condition of the times and the war situation.

A most interesting program has been arranged, with entertaining speakers, excellent music and other attractive features. Major Donald Guthrie of the British Army, who has been in a number of battles in France and was wounded severely, will speak at the banquet. The entertainment committee is Le Roy Clark, J. W. Perry and Charles E. Dustin.

A revised schedule of the section and committee and their meetings to be held in the association rooms, 30 East Forty-second Street, New York, during the week of the annual meeting follows:

Monday, March 18, 1918.—Interlocking standardization committee, 2 p. m.

Tuesday, March 19.—Inclosed fuse committee, 10 a. m.; Snap Switch Section, 10 a. m.; Molded or Formed Insulation Section, 10 a. m.; Lamp Receptacle and Socket Section, 2 p. m.; Outlet Box Section, 2 p. m.; Industrial and Street-Lighting Fixture Section, 2 p. m.; Attachment Plug Section, 4 p. m.; Insulating Materials Section, 4 p. m.

Wednesday, March 20.—Panelboard and Switchboard Section, 10 a. m.; Fuse Section, 10 a. m.; Fan Motor Section, 10 a. m.; Knife Switch Section, 2 p. m.; Non-metallic Conduit Section, 2 p. m.; Metallic Flexible Conduit and Armored Conductor Section, 4 p. m.; inclosed externally operated switches, immediately following Knife Switch Section meeting.

Thursday, March 21.—Annual meeting of the association, 2 p. m., at Delmonico's, New York; social session and banquet, 7:30 p. m., at Delmonico's.

Friday, March 22.—Magnet wire committee, Wire and Cable Section, 10 a. m.

HEARINGS ON ADMINISTRATION BILL TO GOVERN WATER POWER

Special Committee Has Set Aside Whole Week to Hear Testimony of Investment Bankers, Engineers and Utility Operators

The special committee of fifteen having in hand a so-called "administration" water-power bill, which creates a federal power commission to provide for the improvement of navigation, for the development of water power, for the use of land in the United States in relation thereto and for other purposes, has set aside the week beginning March 18 for hearings on the measure. The bill, which is the proposed House substitute for Senate bill 1419, has been modified to include recent suggestions made by the Secretary of War, Secretary of the Interior and Secretary of Agriculture. These three will constitute the water-power commission. The measure, as has been previously pointed out, also provides for an executive officer of the commission, appointed by the President for five years, for the payment of rentals and for licenses for water power on public lands as well as public streams for fifty years.

At the end of the license period the licensee will be allowed to renew the license and remain in undisturbed possession until the proposed commission shall have done one of three things:

1. Issued new licenses under laws then applicable.
2. Given licenses to new licensees who shall pay for the net investment of the licensee in the project.
3. Taken the property over upon paying the net investment of the licensee in the project plus reasonable damages for all property not taken over and damaged by reason of severance.

"Net investment" is given as the actual legitimate original cost as defined and interpreted in the "Classification of Investment in Road and Equipment of Steam Roads," issue of 1914, Interstate Commerce Commission, plus similar costs of additions thereto and betterments thereof, minus the sum of the following items properly allocated thereto, if and to the extent that such items have been accumulated during the period of the license from earnings in excess of a fair return on such investment: (a) unappropriated surplus, (b) aggregate credit balances of current depreciation accounts, and (c) aggregate appropriations of surplus or income held in amortization, sinking fund or similar reserves, or expended for extensions or betterments.

Closing Inefficient Plants to Save Fuel

CONTINUING further its investigation into isolated plant and central-station conditions in New York City, the Public Service Commission, First District, held a hearing on March 11. C. E. Stuart, of the utilities section of the conservation division of the Fuel Administration, was present again as a representative of the Washington authorities.

Mr. Stuart had placed in the record of the proceedings a full statement of the purposes of the federal Fuel Administration in concerning itself with the case.

Supplementing this statement, Mr. Stuart said later to a representative of the ELECTRICAL WORLD that the investigation in which the Fuel Administration is interested is proceeding not only in New York, but also in different ways in other sections of the country. It is possible that one of these investigations will furnish a basis for a broad general solution.

It is proposed to treat every case on its merits, and Mr. Stuart said that the Fuel Administration is anxious that this shall be understood thoroughly. There is no intention, for instance, of issuing a broad, sweeping order condemning inefficient plants.

Some plants can be diverted to central-station service with economy; in others remoteness of location, necessary interior or exterior construction or other considerations would make it inexpedient.

CASES INVOLVING DUPLICATE SERVICE

In addition to the issue affecting isolated plants, Mr. Stuart said that the Fuel Administration is also looking into cases where private and municipal plants are duplicating service. In one Indiana community where this condition existed the local authorities combined, without the influence of the Fuel Administration, to close the inefficient plant.

In his formal statement to the commission Mr. Stuart said in part:

The experience of the past winter has shown that on account of the transportation congestion and other conditions caused by the war some curtailment of the previous rate of fuel consumption by the community is necessary. This curtailment was effected during the past winter by cutting off light, reducing heat, shutting down factories, etc. These methods cause serious inconvenience and loss to many, and it is therefore obviously desirable to secure the necessary economies in the future in less drastic ways, if this is at all possible.

The individualistic way in which fuel is now consumed in cities is not efficient. A ton of coal burned in a large central station will produce at least four times as much electric power as if burned in the average small plant, and if centralized burning could be introduced to a greater extent, the amount of fuel required could be largely reduced without reducing in any way the ultimate production of light and power.

It may be generally stated that in buildings where electric plants are located and where exhaust steam from engines is utilized in the heating of the building, furnishing hot-water requirements and possibly providing a very small amount of steam for industrial and other processes, such a building can readily adopt central-station service without a loss of money and at a large percentage of saving in fuel.

In many other cases it might be more economical from the standpoint of fuel saving to utilize isolated electric plants in conjunction with central-station service. The ideal arrangement would then be to use the combination of services in such a way that no exhaust steam would be sent to the atmosphere to be lost.

It is the duty of the Fuel Administration to devise means for securing a curtailment in the use of fuel in ways which will impose a minimum of hardship. It is believed that there are many plants not only in New York but throughout the entire country which could, at least temporarily, shut down their own electrical machinery and purchase power from others at a financial advantage to both parties and with a considerable saving in fuel.

The subject considered more broadly will affect even the question of whether or not certain central stations now in operation can be economically continued in operation.

There are localities in the country where there is an excess of hydroelectric energy and where at the same time coal-burning central stations are in operation. The saving that could be effected by shutting down the coal-consuming plant, provided it is practicable to do this, is evident. If it be possible to make necessary connections, enabling the shutdown of the coal-consuming plant, it would simply mean that the hydroelectric plant would carry the load of the coal-consuming plant, and it would become a question of an adjustment of rates so as to conserve the interests of the public and of the coal-consuming plant through the period of shutdown.

While it may appear that the interests of the central station are being benefited to a large degree, such is not of necessity the case. In some cases central stations may be shut down. In any event, any connection between a central station and a building or a manufacturing plant that is affected will of necessity be for the period of the war only or through the period where the coal situation is critical. The machinery of the isolated plant can be readily preserved through this period of necessity. Under these circumstances the heavy expense attendant upon the making of the connection by the central station may completely or even more than offset any profit which could be expected of such a load through a short period.

In those cases where small electric plants are closed down entirely there will be a larger number of men available than in cases where a partial closing down is brought about. In any event these skilled men are vitally needed in many of the war industries of this country.

Again, the conservation efforts of the Fuel Administration are being directed in order to conserve the interests of all with the least inconvenience and cost and with the object of making the coal supply that is available go just as far as possible and to prevent the necessity of further drastic measures such as were necessary in January.

The administration at this time has no idea of attempting to bring about any such result by means of orders, or even of suggestions that fuel be saved by the closing of isolated plants, where this would cause hardship to the owners not commensurate with the benefit derived by the public. It is interested in the present hearings, however, in the hope that they will set forth the facts and also the savings which are possible in certain cases in so convincing a way that each plant owner will consider himself a volunteer member of the administration, charged with the duty of investigating his own condition in a non-partisan way and where circumstances warrant it of taking the necessary steps to secure the saving.

J. W. Lieb, vice-president and general manager New York Edison Company, made an extended statement before the commission bearing on the main and collateral questions raised in the investigation. The Fuel Administration is interested in the possible coal economies, and the Public Service Commission is raising also the question of rates.

Mr. Lieb read a statement, in part as follows:

The company had no knowledge whatsoever as to the purpose of the commission in issuing its order calling for these hearings, and it has taken no steps whatsoever with the commission or elsewhere in the direction of agitating or promoting any movement having in view the shutting

own of isolated plants and the substitution therefor of central-station service. It has not attempted in any way to take any advantage of the present situation to urge upon any public authorities, national or local, the desirability of closing down isolated plants as a measure of fuel conservation, nor has it initiated or prompted any action whatsoever ward enlisting their interest or support in such a movement.

It would appear from the opening remarks of the presiding commissioner that this was to be a hearing on fuel conservation; we find it to be in reality a rate hearing, the commission's order making no reference whatever to the subject of fuel conservation.

We are prepared to give "segregated" service as an auxiliary to private plants at our regular rates without any limitations whatsoever. We are also prepared to give peakdown and auxiliary service to isolated plants at the standard rates for this service provided for in our rate schedule. We are not, however, prepared to furnish breakdown service to a so-called block lighting plant, which is not customer's own plant furnishing service for himself alone, it is in effect a small central station supplying energy to

is the endeavor of operators of isolated plants to obtain a special reduced so-called "off-peak" rate for this class of service, notwithstanding the fact that the present rate was arranged for with the approval of the commission to cover just such service under normal conditions and not under such extraordinary conditions as exist at the present time. We shall show by the incontrovertible facts of our experience that under the conditions prevailing on Manhattan Island this service is not an "off-the-peak" service. We are put in the position of presenting testimony now and at this of all times for what seems to be to all intents and purposes a rate hearing having for its primary object not primarily the elucidation of facts in regard to the conservation of fuel but an endeavor to obtain a reduced rate for a special temporary service amply and reasonably provided for, in character of service and rate, by our standard rate schedule.

We may be called upon to present such data as we may be able to prepare on the question of the rate for this service in relation to its cost, but we wish now to place on record our emphatic protest against being required to participate in a rate hearing at this time. It appears to us most unrea-

number of customers outside of the building in which the plant is located, making it an actual competitor of the lighting companies, one over which the commission has not, however, assumed jurisdiction, these block lighting plants paying no franchise taxes and escaping the regulatory obligations and control as to rates, standards and conditions of service, etc., that are imposed on lighting and power companies by the Public Service Commission law and the statutes of the State.

The company in 1908, at the request of the commission and with its co-operation, established a rate which met its full approval, mistakenly, however, called a "breakdown" rate, providing at the same time and under one rate for breakdown, insurance, emergency, auxiliary and supplementary service to buildings obtaining their service normally from private plants installed on the premises. That this service and the rate and conditions under which it is given have been satisfactory and to their advantage would seem to be attested by the fact that over one-half of all the isolated plants on Manhattan Island have availed themselves of it, and the number is increasing, particularly during the last few months.

We now learn from the testimony so far adduced that it

sonable and unfair to consider what in effect is the question of the lowering of rates under conditions when no man can foretell what the morrow may bring forth and under circumstances of such uncertainty, precariousness and dismal outlook that, as the commission well knows, the company is even now seriously considering the necessity of coming before it and asking for a general increase of rates.

In submitting the accompanying curves Mr. Lieb said that it should be noted that this diagram is not strictly correct, it does not show conditions as they really are.

The April and June loads are not on the same basis as the December load. As a matter of fact there was a larger connected load in December than in April or June owing to the fact that many new installations were added to the system between these dates.

If this additional load had been on the system on the dates shown in the April-June curves, the actual peak loads on these dates would have been considerably larger and the reserve capacity as compared with winter conditions would have been still smaller.

CONSTRUCTION OUTLAYS LARGE FOR TELEPHONES

Capital Expenditures in 1917 for Bell System Reach
\$118,600,000—Maximum Requirement for 1918
Estimated at \$90,000,000

Heavy capital expenditures for plant additions made necessary by the war are an outstanding feature of the annual report of the American Telephone & Telegraph Company for 1917. The net amount added to plant and real estate by all companies, excluding connecting companies, constituting the system in the United States was \$118,599,462. This compared with \$66,224,700 in 1916 and was larger than for any previous year by nearly 50 per cent.

Concerning the results of the policy adopted and outlining the probable construction requirements of 1918, Theodore N. Vail, the president, says in the annual report to stockholders:

The continued policy of the Bell system of constructing in advance of requirements, partly to provide for emergencies, and for economical reasons, has again justified itself many times over during the year.

It is difficult to estimate what additions will be made to the plant during 1918. Plans have been made aggregating \$90,000,000. This is believed to be the maximum requirement; the probabilities are that much less will be expended. The government's desire for the conservation of men, material and money for direct-war requirements and the difficulties of transportation because of priority orders and freight embargoes make the exact determination of the program impossible.

The net capital addition of \$118,599,462 was distributed as follows: Real estate, \$13,770,614; equipment, \$28,029,466; exchange lines, \$41,565,583; toll lines, \$25,834,824; construction work in progress, etc., \$9,398,975.

TOTAL OPERATING REVENUES NEARLY \$300,000,000

In round figures the total operating revenues of the Bell system were \$294,900,000, an increase of \$30,300,000, or 11.5 per cent, over last year. Of these revenues depreciation and maintenance consumed \$94,071,000, an increase of \$9,515,000 over 1916, or 11.3 per cent; traffic expenses consumed \$68,122,000, an increase of \$14,373,000, or 26.7 per cent; commercial expenses, \$28,364,000, an increase of \$2,665,000, or 10.4 per cent; general and miscellaneous expense, \$13,850,000, an increase of \$1,947,000, or 16.4 per cent; taxes assignable to operations, in which provision is made for the estimated amount of federal income and excess profits taxes payable in 1918, \$20,711,000, an increase of \$5,795,000, or 38.9 per cent.

During the year \$94,071,000 was applied out of revenue to current maintenance and depreciation, an increase of \$9,515,000 as compared with 1916. Current maintenance increased \$6,227,000, averaging 4.3 per cent on the average plant in service, which compares with 3.9 per cent in 1916.

The provision for depreciation of plant during the year was \$52,919,000, an average of 5.5 per cent of the cost of plant, an increase over 1916 of \$3,288,000.

Mr. Vail says that during the year there was a very general readjustment of salaries and increase in the number of operators to meet the necessary demands.

Regarding the value of the property, A. K. Vail assures security holders by stating: "The minimum replacement value of our property, exclusive of intangibles, is far in excess of the book value, and intan-

gibles represent expenditure and have value. Actual appraisals are continually being made by boards of control, municipal and other rate-making bodies for rate-fixing purposes. They are made by independent appraisers who certainly have no interest in over-valuation. In every case the appraisals have demonstrated the conservatism of the book value."

At the end of the year the number of employees on leave of absence for military, naval and other government war service was 7002.

SUMMARY OF ACTIVITIES FOR GOVERNMENT

In a summary of activities of the system in connection with government matters, Mr. Vail says in part:

Precedence was established throughout the system for all government service, and at Washington and over the entire country for the maintenance of existing government facilities and the construction of the numerous additional ones required.

In other sections it has been necessary to provide telephone facilities and toll connections for the National Army cantonments, National Guard camps, division headquarters of the army and navy, army posts, navy yards, aviation fields, supply, quartermasters' and training camps, munition manufactures, shipbuilding yards, and various federal and state camps and headquarters in different parts of the country. Many of them are far from existing facilities and in sections heretofore not requiring extensive telephone facilities, and some of them are the equivalent telephonically of cities of 30,000 to 40,000 inhabitants.

Several pages in the report deal with the engineering department. Part of this section follows:

During the past ten years there has been a great increase in the number, extent, voltage and current of power and lighting circuits in all parts of the country. Therefore telephone engineers have been confronted by the difficult and constantly growing problems of disturbances in neighboring telephone circuits producing noise, interference with signaling and, in extreme cases, hazard. The electrification of trunk-line railroads, which has been largely a development of the last ten years, has brought up peculiarly difficult problems of this kind. Plans have been worked out as far as practicable for minimizing such disturbances by rearrangements of our wires and modifications in the apparatus associated with them. But in many cases the disturbances have been such that a solution was not to be found by treating only the telephone system. It has been necessary, therefore, to work with many electric light, power and railway interests and manufacturers of electrical power apparatus, and to arrange with them to design and operate their systems so as to reduce the disturbances at the source.

On Jan. 1, 1918, there was one Bell telephone station to each ten of the total population of the United States.

A section of the report dealing with the Western Electric Company, Inc., says in part:

When it became probable that this country would become involved in the great war, the Bell system, in preparation for extraordinary service demands which would come in such a contingency, directly and indirectly, from the various departments of the government, commenced a systematic restraint of station growth. That naturally affected adversely a certain portion of the Western Electric business. Later (in July) it appeared to us that we should do our part to conserve the resources of the country which would be required for war purposes, and we decided to limit construction and reconstruction which would use lead, copper and other materials, and likewise man power, to such work as would further military preparations. This cut down materially another part of the Western Electric product.

With this came the setting aside of its program on central office work and a substitution in its place of emergency requirements for camps, cantonments, etc., so that during the past year the company has been meeting a variety of changes in its requirements which will probably affect its earnings.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Northern California Power Company Elects Officers.—All retiring directors of the Northern California Power Company were re-elected at the annual meeting held recently, W. F. Detert remaining as president, A. S. Carman as vice-president and F. Reese, Jr., as second vice-president. Edward Whaley, former secretary and general manager, was made general manager, and W. H. Pearce, formerly assistant secretary, was elected secretary.

Violators of Light Regulations Considered Slackers.—Secretary H. G. Wilson of the Lucas County (Ohio) Fuel Administration states that violators of the regulations requiring lightless Sunday and Thursday nights and those who keep signs lighted at times not permitted will be branded as slackers and their names will be published as such. Energy was withdrawn from twelve signs in Toledo whose owners had kept them lighted on one recent evening, and it is proposed to continue the campaign against such persons.

Community Facilities in Housing Bill.—The committee on public buildings and grounds has favorably reported to the House of Representatives a bill authorizing the expenditure of \$50,000,000 through the Secretary of Labor for housing local transportation and other community facilities for war needs. This is an administration measure and is likely to be enacted. The report on the bill calls attention to the fact that it "gives to the Secretary of Labor the power to acquire by purchase or otherwise such local transportation and other community facilities, or parts thereof, and equipment as in his judgment may become necessary for the proper execution of the trust created."

Ohio Commission Authorizes Utility Merger.—The Ohio Public Utilities Commission has authorized a merger of four public utility companies operating in Mansfield and the surrounding territory. The companies coming under the merger are the Mansfield Railway, Light & Power Company, the Mansfield Gas Light Company, the Mansfield Electric Light & Power Company and the Ashland Gas & Electric Company. The name of the merged company will be the Richland Public Service Company, and while it will control all of the above-mentioned properties, the Ashland Gas & Electric Company will be operated separately. The Richland Public Service Company is controlled by H. L. Doherty & Company, New York. The commission also authorized the issuance of \$2,942,000 5 per cent bonds, to be marketed at 80. It further authorized the issuance of \$3,200,000 common stock, which will be

placed at 70. Both the bonds and the stock will probably be taken by H. L. Doherty & Company. R. E. Burger will continue as general manager of the Richland Public Service Company.

Relieving Coal Shortage.—A statement has been made by the Commissioner of Agriculture of Montana in regard to the use of electric power by the Chicago, Milwaukee & St. Paul Railway, which awarded recently a contract to the Westinghouse Electric & Manufacturing Company for ten electric locomotives. The railroad is now obtaining 160,000 kw. of electric energy from the hydraulic plant of the Montana Power Company and the saving in fuel effected by this use of water power instead of coal has been very gratifying to the State officials. The commissioner states: "To give an idea of the value of the power which is being generated by these plants it may be stated that to produce 160,000 kw. from coal would require the yearly consumption of 2,500,000 tons, which at the average price of \$4, which would apply at the points where the power is used, would amount to \$10,000,000. When it is considered that the value of this coal is by means of water power being saved each year for future generations, and that during the next ten years this saving will, in all probability, be increased seven or eight times, it is not difficult to understand that true conservation consists in encouraging the rapid development of water power, which unless developed and utilized becomes lost for all time."

Construction to Get Gas Fuel in California.—A. Emory Wishon, assistant general manager San Joaquin Light & Power Corporation, Fresno, Cal., writes to the ELECTRICAL WORLD in answer to an inquiry about its new pipe line: "In the past the San Joaquin Light & Power Corporation has used as fuel for electric generation a certain amount of gas in Bakersfield that has been obtained from the Valley Natural Gas Company. The capacity of the Valley Natural Gas Company's line has been used up, however, in supplying gas for domestic and other consumption, with the result that during the year 1917 practically no gas was used for steam generation in the Bakersfield steam plant. At present the San Joaquin has on order 26.5 miles of 6-in. pipe that is to be delivered in April and May and will connect the Bakersfield steam plant with the main gas transmission line of the Midway Gas Company, 26.5 miles due south of the city of Bakersfield. Last year the Bakersfield steam plant could have used 600,000,000 cu. ft. of gas. This year, unless the wet season starts pretty promptly, we shall use several times as much. The pipe line is to be a welded line and is capable of carrying sufficient gas to allow us to carry a peak of 10,000 kw. without calling on our oil reserve for peak operation. The San Joaquin also has a steam plant at Betteravia, Cal., that is connected to the Santa Maria oil fields with a gas line, and gas at this plant is being made available just as fast as we can deliver electric motors to replace crude boiler plants now operating the oil wells."

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Louisiana Engineering Society.—A. M. Lockett presented a paper entitled "The New Orleans Industrial Canal" before the Louisiana Engineering Society on March 11.

New York Jovian League.—Richard E. Enright, Police Commissioner of New York City, told the story of the New York Police Department at the Jovian luncheon held March 13.

Synchronous Club, Los Angeles.—Lecture No. 10 of the Synchronous electrical course, on "Electric Furnaces and Welding," was given March 7 by J. H. Cunningham of the General Electric Company.

Electrolysis Mitigation.—James A. McKenna of the Providence city engineer's department addressed a meeting of the Providence Engineering Society recently on the subject of "Electrolysis Mitigation."

Arkansas Association of Public Utility Operators.—The State convention of the Arkansas Association of Public Utility Operators will be held at Hot Springs, Ark., on May 21 to 23, with headquarters established at the Arlington Hotel.

Jovian Electric League, Los Angeles.—At the last regular meeting of the league the speaker of the day was August F. Knudsen. The subject of his talk was "Hawaii." T. C. Carr of the General Electric Company was chairman of the day.

The Esthetics of Street Lighting.—S. E. Doane, chief engineer National Lamp Works of the General Electric Company, presented a paper on "The Esthetics of Street Lighting" before the Philadelphia Section of the Illuminating Engineering Society at a meeting on March 15.

New York Chapter, A. A. E.—E. W. McKnight of the First Canadian Expeditionary Forces spoke on "War-Time Experiences" at a meeting of the New York Chapter of the American Association of Engineers on March 13. I. L. Birner, 220 West Forty-second Street, is the secretary of the New York Chapter, A. A. E.

Gear Makers to Meet.—"Gear Standardization" will be the principal subject of discussion at the second annual convention of the American Gear Manufacturers' Association, to be held at Green Brier Hotel, White Sulphur Springs, W. Va., on April 18, 19 and 20. An address by a representative of the United States Chamber of Commerce, of which the association has just become a member, will bring other matters of timely interest before the association.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Refusal to Give Service.—In a decision regarding discontinuance of electric service affecting Max Huhn as complainant and the Richmond Light & Railroad Company as defendant, the New York Public Service Commission, First District, holds that refusal of service by an electrical corporation except upon the payment of a penalty because the service connection has been tampered with is unauthorized under the law; but in view of the fact that complainant may obtain redress by a penalty action under the transportation corporations law and because of the uncertainty as to the commission's power herein, no order was adopted. It was recommended, however, that upon payment by the complainant of \$1.80 for each of the three months during which the meter failed to register service be renewed by the electric company.

Provision for Increasing Service Demands.—Approving plans of the Public Service Company of Northern Illinois for extension, the Illinois Public Utilities Commission declares that it has jurisdiction to enter an order finding the necessity for, and authorizing and directing the construction of, additions, extensions, repairs or improvements to, or changes in, the existing plant, equipment, apparatus, facilities or other physical property of any public utility, if the facts and conditions warrant, irrespective of whether or not property owners are made defendants to the proceeding, or make objections to such extensions or other changes. "It appeared from the evidence," says the commission, "that at the present time the Waukegan plant is normally capable of generating about 8000 kw. of electrical energy and at times has been overloaded to 9000 kw.; that, because of the excessive demands upon said plant and the increasing growth of petitioner's business and of the load carried by said plant, in order to meet properly the demands of the public it is necessary to install without delay in said plant an additional unit of not less than 10,000 kw., and that within four or five years it will, judging from the present rapid rate of growth of petitioner's business, be necessary to install a second additional unit of 10,000 kw. It further appeared that good operating practice, in case of an electric generating plant of this kind, requires that the plant have, adjacent to it, coal-yard storage capacity for at least sixty days' supply of coal; that such a supply of coal is, in good engineering and operating practice, considered the minimum coal supply which such a public utility plant should have on hand at all times in

order properly to protect the public from interruption of service by reason of coal shortage, which is likely to, and very often does, occur as the result of one or more of the following causes: Labor difficulties at the mines, congestion of traffic on the railroads, car shortage, or unfavorable weather conditions interfering with transportation. It further appeared that in order to accommodate such a coal supply and to make a proper railroad track layout to handle such a coal supply, and to insure the continuous and proper operation and maintenance of the enlarged generating station it will be necessary to acquire, and petitioner has sought but without success to purchase, the property adjacent to its present plant hereinafter specifically described."

"When Costs Go Up Rates Should Do Likewise."—In allowing increased electric railways to the Portland Railway, Light & Power Company, the Oregon Public Service Commission made a number of statements touching utilities in general. Some of these are mentioned briefly below: "It is time for the public to realize that the powers conferred upon public service commissions, thoroughly tested and upheld by the courts, are ample for the protection of the public against all the evils from which they have suffered in the past. It is time also to realize that good service can be obtained only by just and equitable treatment. No starved horse ever pulled a heavy load. The utilities have been deprived of the power to make unjust profits. They must also be protected against unjust losses. . . . In spite of all that has been said, there still lingers a popular impression that the difficulties of the street railway company are fictitious and are merely used as a cover for an attempt to extort a profit on watered stock. We therefore wish to repeat with the utmost emphasis that if the stocks and bonds of the company were one hundred times the real value it would have no effect on this case. The appeal of the applicant and the decision of this commission are based on the commission's own valuation of the property. . . . The cost of service would not be less if the city should take over the street-car system and operate it. With the present service and equal efficiency of management, the operating expenses would be the same as at present, while power, instead of being furnished as now at cost, would have to be paid for at commercial rates. Under condemnation, it is not likely that the property could be bought for any less than the commission's valuation, and if the courts took account of the present scale of prices of materials and labor, the cost would be increased at least 25 per cent. . . . Under state regulation of rates no utility is permitted to earn a surplus during good times by which to carry itself over the lean years which may lie ahead of it. Rates must at all times be kept down in conformity with the value and the cost of the service rendered. Justice, therefore, requires that when costs go up rates for service should do likewise."

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Notice of Line Defect.—In action for death of child from contact with a wire of a fence electrified by defendant's live wire, which had fallen upon it, it was held in *Drimel versus Union Power Company* (165 N.W. 1058) that whether defendant was negligent in failing sooner to find break and repair it was a question for the jury.

Anticipation of Danger from Wires Thrown Across Lines.—The Supreme Court of Kansas in *Storm versus Leavenworth Light, Heat & Power Company* (169 P. 556) followed the decision in *Snyder versus Light Company* (98 Kan. 157; 157 P. 442) in holding that a company should by maintaining sufficient insulation provide against dangers from a loose wire being thrown across its lines.

Electricity Deposit Does Not Apply to Gas Bills.—Where a consumer contracted separately for electric energy for lighting and for gas for heating with the same company, depositing \$20 on the electric light contract, the company was not required to apply the deposit to the consumer's arrears on his gas bill before shutting off his supply, the company having no right to divert the deposit without the consumer's consent and apply it to an indebtedness accruing under a contract for gas made some months later than the contract for energy, the Court of Appeals of Maryland held (102 A. 465), *Annapolis Public Utilities Company versus Martin*.

Height of Wires.—While telegraph and telephone wires crossing a highway must be high enough for the usual and ordinary travel, they need not be high enough for extraordinary travel, in which case the traveler must keep a lookout, the Supreme Court of Iowa held (165 N. W. 449). The law authorizes telephone companies to construct their lines along the highways, but one section declares that the line shall not be constructed so as to incommode the public. The owner of a telephone line strung along a country highway constructed the line at a sufficient height at the ordinary points of ingress and egress to clear ordinary vehicles. It was held that, as a landowner is not entitled as against the public to access to his land at all points along the boundary between it and the highway, an abutting landowner could not require the owner of the telephone line to maintain it at a height along the entire boundary of his property sufficient to permit an unobstructed passageway from the highway into his fields, and hence could not assume in passing out of the field into the highway at a place not ordinarily used that the line was high enough to clear his vehicle.

George Oates has resigned from the district managership of the Utah Power & Light Company at Rexburg, Idaho.

Charles B. Hill, Buffalo, N. Y., has been appointed chairman of the Public Service Commission for the Second District.

Carl A. Wolf from has been promoted from assisting operating manager to district manager for the Utah Power & Light Company at Rexburg, Idaho.

C. I. Weaver of Jackson, Mich., has been appointed general manager of the Springfield (Ohio) Light, Heat & Power Company, to succeed Weare Parsons.

E. E. Sanford of the Northern States Power Company of St. Paul, Minn., has been elected a director of the local Y. M. C. A. for the next three years.

George W. Smidt, power-station engineer for the Dubuque (Iowa) Electric Company, has been appointed to a similar position with the Northern Ohio Traction & Light Company, Akron, Ohio.

C. B. Hudson, formerly superintendent of the power plant of the Ithaca (N. Y.) Traction Corporation, has been placed in charge of the power plant of the Strathmore Paper Company, Woburn, Mass.

Major Peter Junkersfield, assistant vice-president of the Commonwealth Edison Company, Chicago, and who was in charge of the electrical construction of the cantonments, has been advanced to the rank of lieutenant-colonel.

Joseph Bamberger, who has been connected with the Northern Indiana Gas Electric Company, Lafayette, Ind., for the last ten years, has been appointed assistant engineer of the Elkhart Valley Electric Company of Elkhart, Ind.

F. C. Adams, St. Louis, Mo., has been chosen chairman of the committee representing the electrical interests of that city on the board of a permanent organization which has been formed to secure the advantages that St. Louis possesses as a center for the manufacture of construction materials for the government.

J. L. Kent, formerly with the Consumers' Power Company, Grand Rapids, Mich., has been appointed commercial manager of the Springfield (Ohio) Light, Heat & Power Company, succeeding J. E. North, resigned. Mr. Kent is a graduate of the Ferris Institute and has been connected with the Godenpyl-Hardy interests for about ten years.

A. N. Richardson, who has been connected with the Union Electric Light & Power Company during the past year in construction work, has been appointed operating superintendent by the Illinois Northern Utilities Company, Dixon, Ill. Mr. Richardson was formerly general superintendent of the Kansas City Electric Light Company. Prior to that he was for a number of years connected with the Washtenaw Light Power Company, later the Washtenaw division of the Eastern Michigan Edison Company.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Francis A. Vaughn, senior member of the firms of Vaughn & Meyer, consulting engineers, Milwaukee, and Charles L. Pillsbury Company, consulting engineers, Minneapolis and St. Paul, has been engaged by the School of Engineering of Milwaukee as business manager and director of engineering and industrial relations. Mr. Vaughn is a graduate of the University of Wisconsin in electrical engineering, class of 1895. He was in the testing depart-

F. A. VAUGHN

ment of the Standard Telephone Manufacturing Company, later in the Gibbs Electric Company and then for fourteen years with the Milwaukee Electric Railway & Light Company in the operating, engineering, meter-testing and distributing departments. Mr. Vaughn has had a very intimate connection with national engineering societies and is a fellow of the A. I. E. E. He has been president of the Milwaukee Electrical League and trustee of the Engineering Society of Wisconsin, besides having been chairman of the Wisconsin Electrical Association committee on revision of the Wisconsin Railroad Commission's electric service rules.

Joe E. King has been transferred from the post of local superintendent for the Southern Sierras Power Company at Corona, Cal., to a similar position at San Bernardino.

Robert C. Lamphier, secretary and general manager of the Sangamo Electric Company, Springfield, Ill., has been elected president of the Springfield Commercial Association to succeed John M. McCreery, manager of the St. Nicholas Hotel. Mr. Lamphier has been active in the Red Cross work in Springfield and has taken a prominent place in civic affairs.

Frank B. Jewett, chief engineer of the Western Electric Company, who received the commission of major last spring, has been promoted to the rank of lieutenant-colonel.

J. I. Matthias, manager of the Leominster (Mass.) Electric Light & Gas Company plants, has resigned to go into business for himself in Worcester. Mr. Matthias has recently been elected chairman of the mercantile bureau of the Chamber of Commerce of Worcester.

S. E. Hutton, for several years head of the mechanical and electrical engineering departments at the University of Idaho, recently enlisted in the United States Army, at Spokane, Wash., as a private in the aviation section of the Signal Corps. Mr. Hutton was formerly consulting engineer of the Idaho State Public Utilities Commission and on the faculties of Highland Park College at Des Moines, Iowa, and the University of Kansas.

James B. Black, formerly assistant general agent of the Great Western Power Company at San Francisco, has taken over the duties formerly discharged by W. W. Briggs, resigned, and has been given the title of general sales manager of the Great Western System. Three distinct systems are operated jointly in the Great Western System. These are the properties of the Great Western Power Company, the Great Western Power Company of California and the City Electric Company.

W. C. Austin, auditor of the Eastern Pennsylvania Railways Company, Pottsville, Pa., has been elected assistant secretary and assistant treasurer of that company. In 1917 Mr. Austin was transferred from the staff of traveling auditors of the J. G. White Management Corporation, New York, N. Y., to the accounting department of the Eastern Pennsylvania Railways Company, which company is being operated by the management corporation. For a number of years Mr. Austin was treasurer and auditor of the Otsego & Herkimer Railroad Company (now Southern New York Power & Railway Corporation), Cooperstown, N. Y.

Obituary

W. J. Macy, formerly secretary to the president of the Birmingham Railway, Light & Power Company, has died of pneumonia in France, where he was serving as a member of the motor-truck department of the quartermaster's service.

A. W. Sharp, Jr., of the Fort Wayne department of the General Electric Company, Chicago office, died, at the age of twenty-eight years, on March 4. Mr. Sharp was a graduate of Lewis Institute, Chicago, and immediately upon leaving school entered the Fort Wayne Electric Works. After that company was taken over by the General Electric Company in 1913 he was employed in the Fort Wayne department, specializing mainly on battery-charging apparatus.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

SUPPLY OF RAW MATERIAL NOW IN FAIR CONDITION

Current Needs Difficult to Satisfy—Anticipating
Requirements the Only Solution—Shipments
and Deliveries Vexing

Broadly speaking, manufacturers appear to be in a fairly satisfactory position respecting the supply of raw material. Interviews with leading concerns in the various branches of the trade confirm this impression. Moreover, there is no indication of uneasiness regarding future requirements, despite the governmental restrictions on certain metals and other basic material. Deliveries, of course, are the bane of the industry, so much so that they are mentioned as affecting the ultimate selling price of the finished product. On the matter of prices generally an authority said that the most important factor contributing to the increases are the intensification of demand for material, the disruption of distributing processes, a shortage of labor and the decrease in the production of various products. Manufacturers with expanding programs are obliged to buy material when the opportunity presents itself for the certain delivery of the goods, preparing against periods when cars are unavailable for shipments. In other words, manufacturers have to stock requirements for future operations on a far greater scale than they would if they could depend on deliveries when the supplies are needed.

As one producer stated, the demand for raw material in the steel, iron and copper lines appears to have no limit. To be sure, it was explained, the situation is badly mixed, but the supply of metal and other material entering into the manufacture of machinery, generators, motors, transformers and apparatus of every description is easing up and deliveries are slightly better. Concerning wire and cables it was learned that copper seems to be plentiful for other than government work and can easily be had if the producers have it, and they are not yet being reported as short of the metal. Prices remain at the official standards. Shipments from the smelters can be made, but the embargoes hold up the deliveries. Unless priority orders, to which all shipments of this kind are subject, are obtained from the freight traffic committee by the consignee, the delay may be indefinite. Cotton and rubber, indispensable in the production of certain wire, cable and other electrical products, are practically in the same class as copper.

In other lines where not only copper is an essential but brass, slate, steel castings and sheets are basic materials a representative of one of the largest manufacturers in either East or West said that his company had anticipated its requirements for the last two years and was therefore fully provided to meet every demand. In the fall of 1915 this concern carefully went over its inventories for the preceding year, and it based its requirements for 1916 on the aggregate plus 100 per cent. It was figured that this would represent the probable increase in the business, and material was placed on order on this basis. Of this stock of raw material 92 per cent was worked up into its finished products, representing only 8 per cent of overbuying. For 1917 the same plan was adopted, with a still further increase of 30 to 35 per cent, which will carry the plant up to September of this year.

By placing its orders far in advance this manufacturer—and there appear to be others following the same plan—provided against future inconvenience or shortage of material. The first question to be considered is the one of delivery, with price secondary, a rule which seems to prevail in every transaction. According to this concern, no contracts on copper can be made for future requirements. It is bought at the market—base price plus the cost of rolling

or drawing. In order to be sure of a shipment of copper a manufacturer had three cars of the metal forwarded by express from Connecticut to a Western city at a cost of \$6,000. The company in question, like three-fourths or more of the manufacturers, has government contracts, and therefore shipments of either raw material or the finished goods are granted the advantages of priority certificates otherwise the embargoes interfere with deliveries to the regular trade.

An advance in steel castings is considered a probability by a number of manufacturers, although it is intimated that the official price, which remains in force until March 31, will remain at the present figure. The American Iron and Steel Institute, acting in conjunction with the War Industries Board on this question, declines to state its position one way or the other. As regards gears and pinions, a manufacturer of prominence said, shipments have been held up since Jan 1, which has resulted in the delivery of only a quarter of the quantity usually sent out. All export business has been suspended for the time being. While government control is not affecting gear steel, forged gear blanks are almost impossible to obtain on reasonable delivery. Pinion material is costing more than ever before, but prices have not advanced recently. Malleable iron is easier. In plants of this description and those on parallel lines in the electrical field labor is the most trying problem. Skilled workmen are required, and they are scarce and of uncertain tenure on account of the abnormal wages.

Quotations on nearly if not quite all raw material for electrical goods are made f.o.b. plant, with shipment at convenience of mill or factory. As one of several manufacturers who volunteered the information said, shipments in the immediate neighborhood can be accomplished, but to reach points in the Middle West with either material or finished goods is difficult, often taking two or three months.

CO-OPERATIVE BUYING BY CENTRAL STATIONS Inexpensive Portable Lamp of Standardized Design Is Produced as the Result of Conference

Thirty thousand portable lamps of a standardized design are to be placed on the market next fall as the result of a recent conference in New England between a group of central-station men and a fixture manufacturer who is handling this order on an off-season basis. This co-operative buying plan includes central stations from some of the largest cities in the country, whose representatives met informally to develop the program of securing a fixture at low cost for multiple production and wide distribution. The movement promises far-reaching results in the large-scale merchandising of electrical appliances. Those behind the plan believe that individualism has been overplayed in many lines of electrical selling to the general public; they believe that certain standardizations of design can be accomplished to appeal to a very wide market, and that through the concentration of orders and through intensive production along repetitive lines costs can be lowered to a point which will mark a new stage in the popularization of electrical merchandise.

When these central-station men assembled they met at a Connecticut fixture factory where an enormous yearly output of kerosene lamps of a simple design is produced for the Chinese trade. They recognized, of course, that no standard design of portable lamp will suit the entire market, but they believe that a large buying power exists among the public for a low-cost standard product of general

application. It is believed that a great many persons will be glad to purchase a portable lamp of uniform design, wholly regardless of the fact that other people may be using the same product, provided that the price is low enough.

The matter was discussed with the manufacturer, and a design of portable lamp has been prepared which is expected to meet an extremely wide range of service conditions, applicable to business and home surroundings. The central-station men present represented the sales departments of their several companies, and it is noteworthy that some of the smaller cities represented were among the heaviest underwriters of the plan.

Owing to its being the dull season in fixture production, it was possible for the manufacturer to take the order upon a very satisfactory basis of cost. The raw material for these lamps has been purchased on a more satisfactory basis of price and delivery than applies to small and individualistic orders for scattering shipment at odd times. The manufacturer has been enabled to plan his production on steady output during the off-season, and the various central stations will receive these lamps at a price which will enable them to market them at about the former factory cost level.

As a result of these negotiations and because of the optimism felt by the central stations concerned, a standardized desk lamp is now in process of development for handling in the same way. One of those attending the conference informed the representative of the **ELECTRICAL WORLD** that the co-operative purchasing plan will probably be extended into other lines of appliances and that the movement marks the beginning of what may prove to be a new era in electrical merchandising.

METAL MARKET SITUATION

Copper in Easy Supply, but Restrictions Are Imposed—Position of Platinum and Aluminum in Question

No trouble is being experienced in obtaining a sufficient supply of copper for "essential commercial purposes," but no commitments on the metal will be accepted by producers or jobbers on contract. The market is the base price, which is a shade lower this week, plus rolling or drawing, subject to the scrutiny of the copper committee in making the allotment of supplies.

One of the elements of interest in the metal market is the position of platinum, now under government control. Germany is now reported to have purchased the entire available supply of platinum in Russia, the world's principal platinum market, and to have made this purchase at her own figure.

Buyers and sellers of aluminum are awaiting the government ruling in transactions on the 32-cent base price at shipping point in lots of 50 tons and over.

Old metals remain at practically the same prices that have been quoted for several weeks, and no unusual demand for them is reported in existence at this time.

NEW YORK METAL MARKET PRICES

	March 4	March 11
	£ s d	£ s d
Copper:		
London, standard spot.....	110 0 0	110 0 0
Prime Lake	Govt. price 23.50	Govt. price 23.50
Electrolytic	Govt. price 23.50	Govt. price 23.50
Casting	Govt. price 23.50	Govt. price 23.50
Wire base	*27.00	26.25 to 26.75
Lead, trust price	7.25	7.25
Nickel, ingot	50.00	50.00
Sheet zinc, f.o.b. smelter.....	†15.00	†15.00
Copper, spot	7.77½ to 7.82½	7.67½ to 7.72½
tin, Straits	*85.00	*85.00
Aluminum, 98 to 99 per cent. .	†Govt. price 32.00	†Govt. price 32.00

OLD METALS

Heavy copper and wire.....	21.50 to 22.00	21.50 to 22.00
Brass, heavy	14.00 to 15.25	14.00 to 15.25
Brass, light	10.00 to 10.50	10.00 to 11.00
Lead, heavy	6.25 to 6.50	6.25 to 6.50
Zinc, old scrap.....	5.50 to 5.75	5.50 to 5.75

*Nominal. †F.o.b. producer's plants.

THE WEEK IN TRADE

JUDGING from the reports received from the cardinal points of the country, electrical business is in excellent shape. An official deliverance that the sale of electrical merchandise was running behind last year's record appears to have been made without the facts. At any rate, the buying of large equipment by shipbuilders and the government continues apace. The aggregate is on an enormous scale; in fact, it dominates the industry.

Freight congestions and troublesome deliveries are more acute than ever in all parts of the country. Some price changes have occurred. On the part of the regular trade there is a steady and increasing demand for staples. In some instances jobbers are having all they can handle in the way of business.

Financially the trade appears to be on a sound basis, with collections from tight to easy. Credit lines have narrowed, ironclad provisions are inserted in contracts, and payment terms are shortened.

NEW YORK

Very little complaint is heard concerning the general average of business in all electrical lines. Occasionally a pessimist is encountered whose selling methods may be responsible for his hypercritical attitude. The large majority of jobbers, distributors and dealers, as well as manufacturers, report an active demand for electrical staples and specialties. The volume of trade is greatly in excess of the same period last year. With a shortage in certain lines a demand for second-hand equipment is in evidence, and this class of goods is said to be moving out as rapidly as acquired. Some changes in prices have occurred, but no recessions are recorded. Shipments and deliveries which are still restrictive, are troublesome factors and will probably not be wholly eliminated under current conditions.

Differences exist respecting financial obligations, but collections, on the whole, are fairly prompt. Credits receive close attention, and trade acceptances are being strongly urged by jobbers as the best solution in the sale of merchandise as against open-book accounts.

FUSES.—An active market is the majority opinion of distributors and jobbers, with dealers keeping representative stocks and reporting a brisk movement.

LAMPS.—The situation is very much improved with the elimination of the slow sellers and the distribution of stocks on a more equitable basis. An ample supply is reported with the exception of some standard sizes, which are being taken over by the government in large quantities.

PANEL SLATE.—An advance of from 20 to 25 per cent was made within a few weeks. The best grades, free from flaws or metallic veins, are none too plentiful. The difficulty of retaining labor at the quarries is also adding to the cost, as well as deliveries, which are not infrequently made by express. The express carriers are becoming more exacting in their acceptance of shipments, and this is becoming likewise bothersome.

HEATING APPLIANCES.—Trade of a very satisfactory nature is a current condition in every branch of the business. Jobbers and dealers are also stocking up on a generous basis with the regular lines of household appliances, including washing and sewing machines, flatirons, toasters, percolators and chafing dishes, in anticipation of heavy sales during the warm weather.

PORCELAIN.—The market is short in all goods of this kind, and stocks in the hands of distributors, jobbers and retailers generally are low. This is to be accounted for by the extraordinary buying for government needs. It is believed that the situation will not ease off appreciably until these requirements are satisfied.

COLLECTIONS AND CREDITS.—A few reports are to the effect that collections are falling behind, but the greater number bear a favorable aspect. It appears that when financial obligations receive unremitting care the results are proportionate to the effort. The lack of building operations and erratic deliveries of goods are cited as primary causes for the slowing up of payments by contractor-dealers. Credits have not eased off so far as can be noticed.

SOCKETS.—Every variety of the line is spoken of as in steady sale, with no complaint of a present or anticipated shortage.

CONDUIT.—Prices have receded about $5\frac{1}{2}$ per cent—4 points. On all sizes this staple is extremely short in supply. A few jobbers who are yet receiving shipments under old contracts—which are being carried out by the producers most reluctantly, reports say, on account of the price—have a small stock. This is tenaciously reserved for the highest selling figure obtainable. Delivery is the primary consideration, with price a secondary matter.

DRY BATTERIES.—No advance has been made in several months, despite statements to the contrary. Fair stocks in the hands of primary distributors and manufacturers are reported.

CHICAGO

The tone everywhere in the trade during the last week has been more optimistic. The fact that more sales were made in February than in January and increased activity that comes with spring in part are responsible for the general tone. Central stations are not buying much, but the retail trade is better. Moreover, the conditions seem to be improving even in the building field. The record of building permits and electrical permits, which had reached a very low mark early in 1918, is now climbing slowly but steadily.

In the week ended March 6 permits aggregating \$422,800 were issued. In the previous week there were thirty-four permits aggregating \$505,800, and in the same week last year there were 139 permits, aggregating \$1,281,850. In the week ended March 6 558 electrical permits were issued, totaling 5961 incandescent lamps and 578 hp. in motors. In the week previous there were 452 permits, aggregating 5794 lamps and 469 hp. in motors. In the same week in 1917 there were 781 electrical permits.

HEATING APPLIANCES.—Shipments of hollow ware from the East that have been en route for five weeks have not yet arrived in Chicago.

CONDUIT.—The delivery situation is improving. It is now possible to get shipments through on priority orders in fairly good time, whereas it formerly seemed impossible to get shipments on any kind of an order. The price of conduit has taken a four-point drop, which amounts to about 5 per cent. This was done to put the finished-product price more nearly in line with the government's fixed price on raw material. The price change is said to have no relation whatever to conditions of supply and demand in the market.

LAMPS.—Demand is strong and steady. Deliveries are getting better.

ELECTRIC TRUCKS.—Thirty-five trucks have been sold in Chicago in the last winter. Prospects for more sales this spring are bright.

FLOODLAMPS.—Business, which was stimulated to an unexpected degree by plants with war orders, has continued unabated. It is now characterized as "better than ever."

FARM LIGHTING SETS.—Business is improving steadily and at a fairly rapid pace, although there can hardly be said to be a boom in progress. There is an increasing tendency to distribute these goods through the electrical trade.

INCANDESCENT LAMPS.—A one-year contract to provide electric bulbs to all Indiana State institutions has been let to the Indianapolis Belting & Supply Company. To the same company was awarded a contract to provide other electric lighting supplies. The contract for electric bulbs provides that \$10,000 worth shall be used in a year.

BOSTON

War industry dominates the electrical trade as the spring approaches. The volume of business continues very heavy. Prices show little change, barring an advance of \$5 in electric valve grinders scheduled for last Monday. Central stations with few exceptions are maintaining an extraordinarily conservative policy regarding new work, but the easing of the fuel situation and restoration of normal lighting five nights a week are stimulating earnings and to some extent will be reflected in the future sales of supplies. Collections are tight, for the most part. Trade acceptances are coming into more general use in jobbing circles.

It is announced that the government will expend a total of about \$18,000,000 on the great army base to be built at Boston for transatlantic forwarding. Jobbers expect to obtain heavy orders of equipment and supplies in connection with this terminal. The large army and naval stations continue substantial buyers of supplies. Military and naval hospitals are buying electric centrifuges in quite large volume. It seems impossible to get any one to say a good word for the railroad service, deliveries showing little if any improvement as yet. A decided boom in the sale of electric road trucks is noted in the Boston district. Labor is quiet.

MOTOR-DRIVEN VALVE GRINDERS.—These are in great demand, and factory stocks are reported to be low. An advance in price from \$30 to \$35 was scheduled for Monday in the case of the Stenman electric valve grinder made at Worcester, Mass.

IGNITION BATTERIES.—Stocks are in good shape. One dealer has just received two carloads of batteries, and the outlook is excellent for spring business.

ELECTRIC TRUCKS.—A decided increase in the demand at Boston is noted for electric road trucks. One dealer has sold sixty-eight trucks in the last three months. Deliveries are being made in one to two weeks.

INDUSTRIAL ELECTRIC TRUCKS.—Inquiries are increasing. The government was reported to be in the market for forty-eight units at the end of last week. Prices remain steady and deliveries fair.

ELECTRIC PASSENGER CARS.—Interest is increasing and is reflected in good sales. A prominent dealer sold all the cars he exhibited last week at the Automobile Show.

LAMPS.—Consumption is increasing, with the abandonment of lightless nights. Production is in good volume and railroad delays are the chief obstacle to local stock building.

WIRE AND CABLE.—Government orders in heavy volume predominate, with firm prices and poor delivery conditions due to railroad difficulties.

FIBER CONDUIT.—Although business is quiet and inquiries have not matured to any great extent, one large central-station order covering the year's requirements has been booked by a Boston agency, following a proposition by the latter to carry the completed product at the factory pending service demands. Prices are steady and deliveries can be made along satisfactory lines.

ASBESTOS INSULATION.—Business is very active, with no change in prices. It is difficult to accumulate factory stocks at present.

ELECTRIC RADIATORS.—Jobbers report a remarkably good season, which is still continued. One wholesaler has distributed 6500 radiators of a single make since Jan. 1, and looks for an attractive business in connection with summer cottages and camps this year.

MOTORS.—A heavy demand is noted for sizes of 10 hp. upward, with fair deliveries. A representative quotation is from two to three months on standard types of alternating-current and direct-current motors, four months being promised on special equipment. Government orders are well maintained and constitute the backbone of the motor business to-day.

CONDUIT.—Spasmodic deliveries continue to disturb the market. Jobbers appear to be well stocked in smaller sizes, and here and there larger diameters are in the bins. Last week's four-point drop in price means little to New England under existing delivery conditions. Some goods ordered a year ago are still to be received.

ATLANTA

As a rule reports agree that trade in general is running well ahead of the same period last year. Whether the increase is based on monetary value or volume is debatable, but opinion appears to favor actual gains in physical volume as accountable for the excess. The congestion in transportation has measurably subsided, and shipments from points west of Pittsburgh consigned south are moving freely; but, on the other hand, freight movements from Eastern points to this section are very slow. The aggregate value of building permits for February was greater than for any month since last September. Industrial construction continues to expand, with a large volume under way. The Saxon and Spartan Mills, Spartanburg, S. C., have closed contracts for approximately \$110,000 worth of electrical equipment. Individual motor drive will be used practically throughout both mills. Energy will be secured from the Blue Ridge Power Company, Spartanburg, an affiliated corporation.

STREET LIGHTING.—There is no noticeable activity in new equipment, but jobbers state that a number of municipalities are buying freely of replacement material, such as reflectors and miscellaneous goods, to handle much-needed repairs. Deliveries on all classes of this material are good, and jobbers experience no difficulty in taking care of the volume of business from local stocks.

FANS.—Jobbers report a substantial number of inquiries for early delivery. Some sales have been made on the basis of 15 to 25 per cent above 1917 prices.

ATTACHMENT PLUGS.—While the call for these has been good, the demand has been further stimulated by anticipated fan business. Local stocks are in good shape.

DRY BATTERIES.—The demand has been phenomenal and it is merely a question of having them on hand for delivery. Shipments to this section have been spotty, but on the whole carload-lot deliveries are pretty fair considering the Eastern freight congestion.

FLASHLAMPS.—Demand is very steady, with about the same volume of sales as registered during the last six months. Batteries and casings for the dollar and two-dollar sizes are very hard to get, and stocks are low.

PIPE FITTINGS.—This line follows closely the call for steel products, which has been strong. A slight improvement is noted in deliveries.

PORCELAIN PRODUCTS.—There is no cessation in the demand for knobs, cleats and tubes. Local stocks are pretty well cleaned out, and replacement orders are not coming in.

SOCKETS.—Stocks are very low, and more or less trouble is experienced by the jobbers in handling the large demand.

LAMPS.—There appears to be no let-up in the volume of business being done. All standard sizes are popular. Stocks are holding up well under the pressure, and deliveries are prompt. There is no evidence at this time of the shortage which was predicted some time back.

SEATTLE

The usual heavy volume of sales to shipyards and industrial plants was maintained during the week. There is considerable big business in prospect. The contract will be let shortly for the power apparatus for a new shipbuilding plant to be among the largest in the Northwest. Several new plants will soon let contracts for the larger sizes of wire and cable. As regards inquiries and prospective business, last week exceeded the record for several months. Stocks of sewing and washing machines are running low but heavy shipments are en route. Sales of these and other domestic appliances are maintaining the levels of several weeks past.

The condition of car shortage is reported equal in seriousness to that of the fall of 1916. The shingle-mill owners in the West coast territory have voluntarily brought the industry under an eight-hour day, as have the lumber mills in the Western Pine Association in eastern Washington and Idaho.

Bulk handling of wheat is gaining in favor to such an extent that the authorities state that more than 200 grain elevators will be erected in the Northwest this year. One Port-

land firm alone has a contract for twenty-five, ranging in price from \$25,000 to \$35,000 each. Electrical jobbers in the Portland and Spokane fields particularly report increasing inquiries and orders for both large and small motors and lighting equipment for elevators under construction. Thirty thousand acres of land will be devoted to the sugar-beet industry in Yakima County, Washington, this year, instead of 10,000 as last year.

Seattle faces spring with its available supply of rented houses exhausted. The problem of housing Eastern mechanics and families employed in the shipyards is serious. New residence building continues increasing. Tacoma shipyards plan asking the government for \$1,500,000 to meet the housing problem. The principal activity in building lines in the Northwest cities is in residences, and this, in Sound cities especially, is heavy.

Retailers report that the lighting fixture business is daily increasing as the result of residence building and remodeling. In new residences fixtures are not installed until the houses are sold, builders leaving the selection of the class to the option of the purchaser. Sales of drop cords, switches and buzzers are heavy, and March business is expected to be exceptionally heavy. Floodlamps are selling as fast as they can be obtained. Portland and Gray's Harbor fields are buying heavily. Stocks are low, but it is believed will be in good shape in three weeks with shipments en route.

SAN FRANCISCO

The past week has been unmarked by any striking developments. Jobbers report the arrival of several long-expected carloads, covering such necessities as rubber-covered wire and schedule material and such articles of popular demand as sewing machines and washing machines. The rainfall continues, guaranteeing a very prosperous year to the coast. Governmental and State contracts are helping to ballast building conditions. In the past week the government awarded two contracts, amounting to \$1,000,000 each, for the construction of two aviation schools and camps, one to be built at Mills, near Folsom, Cal., and the other at Riverside, Cal. Buildings to house various war activities are to be erected by Red Cross chapters. The Rolph Shipbuilding Company at Eureka will erect the first unit of fifty community cottages for employees of its plant, and a number of fruit-drying stations, to accommodate a million-dollar contract from the government, will be built by E. C. Horst.

Oakland building permits for February were 172 in number and aggregated \$408,000. San Francisco building permits were 340, to cost \$538,000. Government work is censored and is not included in this report. The San Francisco comparative report for 1917 was \$1,166,000. This is about the average decrease in private construction. Reports from southern California make light of the strike of electrical workers on the lines of the Southern California Edison Company.

MOTORS.—The demand for motors is good and well distributed. For small-size motors stocks and deliveries are excellent, the greatest demand being for pumping plant sizes of 1 hp. to 5 hp. inclusive. For larger sizes, 15 hp. and over, the demand exceeds the supply. Dealers in second-hand motors are doing a good business and find a market for every old motor that they can refurbish and put back.

FARM PLANTS.—The prosperity of farmers in general and the influence of several large advertising campaigns on farm plants are producing a good demand. Deliveries are poor. In the opinion of shrewd observers this demand will continue to increase, one decided factor being the influence of the automobile and the realization of farmers, through its use, that gasoline engines and storage batteries are not too technical and complicated to be handled by them.

INSULATING MATERIAL.—Deliveries, stocks and sales are all good, with the solitary exception of linen tape, which requires six months for shipment. The products of factories making this tape are absorbed by the Red Cross. The demand for second-hand motors, referred to above, is responsible for a big demand for insulating material to be used in repairing them, also for second-hand transformers. The shipbuilding industry requires a considerable amount of fiber to be used in pipe gaskets.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased

freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Shade Holders

Harvey Hubbell, Inc., of Bridgeport, Conn., has placed on the market a line of brass shade holders of the three-screw type for use with medium and mogul base weatherproof and porcelain

FOR USE WITH MEDIUM AND MOGUL
BASE SOCKETS

sockets. The attachment to the socket is accomplished by means of a clamp and screw arrangement which guarantees a firm grip. The holders are given a bright dip and lacquered finish, making an attractive as well as useful device.

Floodlighting Projector

A floodlighting projector designed for use of 300-watt to 1000-watt standard Mazda "C" lamps has been placed on the market by the George Cutter Company, South Bend, Ind. It is called the "Standard" floodlighting projector.

The new unit has the same general construction features as the Cutter "Universal" projector for floodlighting lamps, features which have made the latter unit popular because of its adaptability for the many purposes for which floodlighting projectors can be used. They include weather-proof and fume-proof body or housing cast of aluminum or gray iron and forming absolute protection for the lamp and reflector, a method of mounting that permits of the projection of light in

FOR STANDARD MAZDA "C" LAMPS

any direction in any plane, construction of the housing that permits of the interchange of narrow or wide angle-beam reflectors, and sectional wireglass doors to minimize breakage.

In this projector the socket is ad-

justable both horizontally and vertically for focusing the lamp or changing the width of the beam. When adjustment is made the socket is locked in position. Reflectors are made of copper, heavily silver-plated and finished with a coat of water and fume-proof lacquer. The narrow-beam reflector has a divergence of 10 deg. and the wide-angle-beam reflector a divergence of 30 deg. They are designed to redirect the maximum amount of light from the lamp.

Disk Fans

The Bicalky Fan Company of Buffalo, N. Y., has developed a disk fan that is constructed entirely of steel. The hub is conical in shape, thereby offering the least resistance to the air, it is pointed out. This fan is equipped

CONSTRUCTED ENTIRELY OF STEEL

with ball bearings running in oil. The center shaft is stationary and the steel hub revolves in the shaft. The wheel shaft is hollow, thus providing a large oil chamber, so that the fan requires oiling only occasionally. The fan is equipped with self-oiling babbit bearings.

Electric Heating Pad

The Wirt Company of Philadelphia has developed an electric heating pad in which the heat-producing element is inclosed between two sheets of rubberized fabric, permanently vulcanized together. The wire is laid in parallel strands 1/16 in. (0.16 cm.) apart.

The manufacturers point out that many pads are equipped with a thermostat. A thermostat in this pad is unnecessary. The wire that is used is

such that as the heat increases the resistance increases, automatically reducing the watts consumed. Hence, it is pointed out, the wire in the pad is itself a thermostat, which will always work, providing absolute protection against excessive heat. The pad itself may be washed or scrubbed with soap and water as often as necessary or may be sterilized by dipping in boiling water for a minute or two. The rubberized fabric will not permit the water to come in contact with the resistance wires. The slip-on cover furnished with the pads is easily removed. It is furnished with 8 ft. (2.4 m.) of cord and attachment plug. Close to the pad is a slip connector, which enables the user to shut off the heat.

Plastic Refractory for Baffles

Jointless and gas-tight baffles can be made by the use of a refractory known under the trade name of plastic firebrick and manufactured by the Betson Plastic Fire Brick Company of Rome, N. Y. This material was originally introduced for lining boiler furnaces and is compounded of refractory materials so prepared as practically to eliminate expansion and contraction with changes in temperature.

Where this material is used there is no restriction upon the shape or size of the baffle, and the latter can therefore be arranged in any form desired. In cross-baffled boilers, for example, it is becoming the practice to slope or incline the baffles, so that the gas passage will contract progressively from the point where the gases enter the tube to the point where they leave, in order to maintain a uniform gas velocity, in spite of the shrinkage of gas volume with cooling. This is easily accomplished with the plastic material, whereas with the solid bricks or blocks a special block is required which can be inserted and maintained in place only with difficulty, if at all.

This material also finds use as a substitute for special forms of bricks or blocks, as, for example, where the front headers of horizontal water-tube boilers rest upon the front arch. Its use for lining furnace and combustion chambers, including front arch, side walls, bridge wall, rear arch, etc., has been described previously. The exacting tests to which it has been put in direct contact with the fuel bed and with the gases of combustion before they have been cooled by the boiler surfaces proves its ability to withstand high temperature gases and stresses such as are encountered in furnace construction for long periods without crumbling or otherwise deteriorating.

Disk Stoves

A four-heat disk stove is being manufactured by Landers, Frary & Clark of New Britain, Conn. A disk 3 in. (7.6 cm.) in diameter is surrounded by a ring 6 in. (15.2 cm.) in diameter. Each has a heating unit which can be

FOUR-HEAT STOVE

operated independently or in conjunction with the other. Two single stoves are thus combined in one and at a cost less than that of the regular two-heat disk stove, it is said.

The nichrome wire heating unit is incased in a polished and blued cast-iron top. The stand is nickel-plated. The wattage of each unit is 300 and the total wattage 600. A neat convenient handle is provided. This device has a wide field in homes, laboratories, schools, shops, drug stores, prescription counters and hospitals.

Automatic Starting Switch for Squirrel-Cage Motors

The control from a remote point of the starting and stopping of single-phase and standard polyphase motors, as well as high-torque polyphase motors, is often desirable, if not essential. Such installations in connection with pumps for railroad water tanks and various other pump and compressor applications, coal and ash conveyor installations, etc., are at once called to mind. The control may be a float switch closing and opening the control circuit with changes in the water level of a tank, or a pressure regulator performing similar service in a closed system, or control may be had by push-button stations, one button being normally open and one normally closed. In any case some form of automatic device must be used, unless the motor is very small, to handle the motor current. An automatic starting switch which is of the double-pole clapper type is made for single-phase and standard polyphase motors up to 15 hp. and for high-torque polyphase motors up to 50 hp. Besides the double-pole switch, two inverse-time-element overload relays are mounted on the same slate panel, which is supported on a pressed-steel frame.

When used with a float switch, pressure regulators or a snap switch, the overload relays are arranged for manual reset; hence when an overload occurs the operator is required to go to the starting panel before the motor can again be started, a feature which results in more careful attention to operating conditions and less motor abuse.

When used with three-wire controlling apparatus, such as two push-buttons, one normally open and one normally closed, the overload relays can operate with a self-resetting feature.

The wiring diagram below shows the advantages of this feature and why depressing the start button will immediately restart the motor after a shut-down from overload trip, voltage failure or intentional stopping with stop button.

Except on some of the smaller sizes, both poles of the main contactor are equipped with powerful magnetic blow-outs. The clapper switch fingers are standard C-H butt contact construction with hard-drawn copper tips. By the use of shading coils these contactors gain great holding power and there is a total absence of magnetic hum.

The relays used on these panels are of that type in which the length of time between the instant the overloading condition arises and the instant of opening the control circuit is inversely pro-

DIAGRAM OF CONNECTIONS FOR STARTING SWITCH WITH OVERLOAD RELAYS HAVING SELF-RESETTING FEATURE

portional to the amount of the overload. They give adequate protection to polyphase induction motors against excessive continued overloads and yet permit a large inrush of starting current.

The complete panel is known as an "across-the-line type self-starter" and is manufactured by the Cutler-Hammer Manufacturing Company, Milwaukee, Wis.

Safety Switch

The Metropolitan Electric Manufacturing Company, Boulevard and Fourteenth Street, Long Island City, New York, is manufacturing a safety switch for the W. A. McCombs Company of Pittsburgh, Pa. This is a quick-break switch mounted in a box said to be unusually strong. The cover is in three pieces. The upper and lower doors each move on separate hinges and the middle section is attached to the box by two screws. The top door over the switch compartment may be opened by means of a lock which permits ready inspection. The lower door over the fuse compartment is held by a snap catch. No live parts are exposed. The safety

switch rated at 30 amp. is a 60-amp. switch with 30-amp. fuse spacings to give mechanical strength.

Combination Air Compressor and Grinder Outfit

The United States Air Compressor Company, Cleveland, Ohio, has recently announced a combination air compressor and grinder outfit which is especially suitable for service in garages and similar places where compressed air is required.

The outfit consists of a self-oiling air compressor with filtering trap, check valve and safety valve, buffing head, 30-gal. (113.6-l.) tank, air-pressure gage, needle-point valve, pipe and fittings, armored hose, automatic air chuck, 6 ft. (1.8 m.) of armored cable with plug, all mounted on a metal base to form a compact unit which requires but little floor space.

The outfit is equipped with an extra tank, the function of which is to permit the motor to start against no pressure and attain full momentum before assuming its full load, thereby eliminating the cause of burned-out motors and other motor trouble.

The outfit is equipped with a 1-hp. Robbins & Myers motor which permits the compressor and buffing head to operate at the same time. Outfits without this buffing head are equipped with a 0.5-hp. Robbins & Myers motor.

Waffle Iron

Waffle irons for lamp sockets are now being manufactured by Landers, Frary & Clark of New Britain, Conn. Highly polished nickel finish gives them a pleasing appearance. This, combined with aluminum grids which require no grease and are smokeless, makes the iron desirable for dining-table use.

The waffles are 3½ in. by 3½ in. (8.9 cm. by 8.9 cm.), and two are prepared simultaneously. Only a minute and a

CAN BE USED ON THE DINING TABLE

half is required for cooking. These irons are available in standard voltage ranges, wattage 600. Gift shops, tea rooms, confectionery shops and soda counters will find ready sale for waffles prepared in this way.

Trade Notes

P. B. ZIMMERMAN has been appointed publicity manager of the National Lamp Works, succeeding N. H. Boynton. Mr. Zimmerman was editor of the *Mazda Stimulator*.

THE GENERAL STORAGE BATTERY & REPAIR COMPANY, Jersey City, N. J., is planning to increase its present capacity and is making improvements and additions to its plant.

THE NATIONAL LAMP WORKS OF THE GENERAL ELECTRIC COMPANY have opened at Detroit, Mich., a new, completely equipped factory for the production of National Mazda miniature lamps.

THE WEEHAWKEN TUNGSTEN LAMP COMPANY of Weehawken, N. J., has plans under consideration for the reconstruction of its tungsten-lamp plant, recently destroyed by fire with a cost of \$25,000.

THE PERMITT COMPANY of New York City, manufacturer of water-softening and rectification apparatus, has removed from 30 East Forty-second Street to 410 Fourth Avenue, where the entire top floor will be occupied by its offices.

THE WESTINGHOUSE ENGINEERING & MANUFACTURING COMPANY, East Pittsburgh, Pa., has leased for a period of years the Baxter Stove Company at Mansfield, Ohio, with the intention of consolidating at this point the manufacturing of heating appliances now being carried on at some of the other Westinghouse plants.

THE NATIONAL CONDUIT & CABLE COMPANY of New York City at a meeting of the directors last week elected George J. Jackson president, to succeed Edward S. Perot, and Norton A. Howard, formerly secretary, was chosen vice-president, to take the place of Edward S. Perot, Jr. H. J. Pritchard, formerly treasurer, was elected secretary and treasurer to succeed Mr. Howard.

THE BUCKEYE DIVISION OF THE NATIONAL LAMP WORKS OF THE GENERAL ELECTRIC COMPANY has moved its Chicago offices from 54 West Lake Street to larger quarters in the Le Moyne Building, at Wabash and Lake Streets. N. H. Boynton has been appointed general manager of the company, succeeding Leroy P. Sawyer, who goes to Cleveland to take up executive work with the National Lamp Works.

THE UNO-LITE COMPANY OF AMERICA, which was originally organized as a partnership to sell reading lamps, has been incorporated under the laws of the State of Indiana. The capitalization consists of 300 shares of common stock at \$50 par value and 400 shares of preferred stock at \$50 par value, making a total capitalization of \$35,000. The preferred stock is cumulative 7 per cent and shares in addition proportionately with common stock in all profits of the company after 20 per cent has been paid on the latter. The officers of the Uno-Lite Company include H. H. Harrison and R. A. MacGregor of the Merchants' Heat & Light Company, Indianapolis, Ind.

BENJAMIN F. CHASE, United States Consul at Santa Rosa, Costa Rica, informs the State Department that in the fire which on Dec. 28 last destroyed the American consulate with many other buildings all catalogs, directories and year books of chambers of commerce, and trade journals were lost. A permanent new office has now been secured and occupied, where such publications can be properly displayed. It is requested that firms seeking sales in that market send copies of their latest catalogs and that chambers of commerce send their year books and directories for the files of the consulate. It is well to note that the cost of receiving parcel-post packages is 75 centavos (about 16 cents at present rate) per package and that only the small catalogs need be sent.

THE AMERICAN GEAR MANUFACTURERS' ASSOCIATION will hold its second annual convention at Green Brier Hotel, White Sulphur Springs, W. Va., on April 18, 19 and 20. An address by a representative of the United States Chamber of Commerce, of which the association has just become a member, will bring matters of timely interest before the association. The convention will begin with meetings of committees on the morning of April 18. At 1:30 p. m. the first session will open with an address by President F. W. Sinram on "The A. G. M. A. Past, Present and Future." Following the address by the Chamber of Commerce representative, C. R. Poole will talk on the "Hardening and Heat Treating of Gears" and B. F. Waterman will present the report of the standardiza-

tion committee. The following morning's session will include reports of officers and committees. An informal banquet will be held in the evening. The next morning a paper on "Uniform Cost Accounting" will be presented by J. H. Dunn, and one on "Hobs and Hobbing Machines" by a representative of the Barber-Coleman company. A program of sports and amusements has also been arranged.

Trade Publications

FANS AND BLOWERS.—The Healey Fan Company of Buffalo, N. Y., has prepared a circular descriptive of its fans and blowers.

LIGHTING UNIT.—The Reflectolyte Company, 914 Pine Street, St. Louis, Mo., has prepared a folder descriptive of its "Reflectolyte."

SOCKETS AND RECEPTACLES.—Pass & Seymour of Solway, N. Y., are distributing leaflet 42-A, descriptive of their key and keyless sockets and receptacles.

CENTRIFUGAL PUMPS.—The Manistee Iron Works Company of Manistee, Mich., has prepared its bulletin No. 54, descriptive of its multi-stage centrifugal pumps.

AUTOMATIC STARTERS.—The General Electric Company of Schenectady, N. Y., has prepared a circular descriptive of its automatic starters for direct-current motors.

FLOODLIGHTING PROJECTORS.—Bulletin 338, descriptive of Cutter "Universal" and "Standard" floodlighting projectors, is being distributed by the George Cutter Company of South Bend, Ind.

REDUCTION GEARS.—Marine application of reduction gears of floating-frame type is the subject of reprint No. 62, now being distributed by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa.

SMALL-GEARED TURBINE-GENERATOR UNIT.—The Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., has prepared a leaflet descriptive of its geared turbine-generator units in sizes from 15 kw. to 50 kw.

HEATING PAD.—The Wirt Company of Philadelphia has prepared a folder descriptive of its electric heating pad. The heat-producing element of this pad is inclosed between two sheets of rubberized fabric permanently vulcanized together.

ELECTRIC HEATING DEVICES.—The Simplex Electric Heating Company, 85 Sidney Street, Cambridge, Mass., is distributing a folder containing bulletins descriptive of its electric heating devices. A revised list and index, dated Feb. 1, 1918, is included.

JOBBER'S CATALOG.—The Monarch Electric & Wire Company, Adams and Desplaines Streets, Chicago, has ready for distribution its catalog No. 20, which contains over 1100 pages. This catalog has a wire list which is said to be the most complete published up to the present time. The book contains over 100 pages of information such as the Fire Underwriters' rules, illuminating data, industrial motor application and useful data covering storage batteries. It also catalogs a complete line of electrical supplies and construction material, well illustrated.

FLATIRONS.—Landers, Frary & Clark of New Britain, Conn., have prepared a handsome life-sized window-display cut-out in nine colors, showing an attractive girl using a real Universal iron. It measures about 34 in. high by 24 in. wide. This will be ready for distribution about April 30. Dealers may arrange with their jobbing houses for these displays. The spring national advertising of Universal electric home needs will feature this cut-out, and this affords the dealer an excellent opportunity to identify his store with the Universal trade name and national advertising.

ELECTRICAL EQUIPMENT FOR BREWERIES.—The Cutler-Hammer Manufacturing Company of Milwaukee, Wis., has just issued publication No. 220, a four-page pamphlet illustrating and describing C-H electric beer-vat dryers and stating some advantages of drying beer vats by electricity. The C-H beer-vat dryers are made with two and three heats and in three sizes, ranging from 750 watts to 1250 watts on low heats and from 3000 watts to 5000 watts on high heats. The pamphlet also illustrates a direct-current motor starter, a porcelain push socket and a porcelain push switch especially adapted for use in breweries and other damp places.

ELECTRICAL HEATING.—Of interest to everybody connected with the heating of baking, drying and jappanning ovens is

reprint No. 66, just issued by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa. This includes an article on "Electrically Heated Jappanning Ovens" by C. F. Hirschfeld, reprinted from the *N. E. L. A. Bulletin*, and "Heat Calculation for Baking and Drying Ovens," by W. S. Scott, reprinted from the *Electric Journal*. Thus there are grouped under a single cover an article giving general considerations in favor of electrical heating for this purpose and an article giving the detailed method of calculation for the amount of heat required to raise the temperature of the work, of the supporting and carrying parts, such as trucks, and of the ventilating air. How to compute the losses from the external surface of the oven and the heat required to raise the temperature of the oven walls, etc., are also told. This publication should be of much value to central-station solicitors who are endeavoring to interest their customers in the electrical heating of ovens, as well as to present and prospective users of such equipment.

New Incorporations

THE UNITED STATES TURBINE MANUFACTURING COMPANY of Quincy, Mass., has been incorporated with a capital stock of \$50,000. George A. Weaver is president.

THE ELK PARK (N. C.) ELECTRIC LIGHT & POWER COMPANY has been incorporated with a capital stock of \$25,000 by A. P. Brinkley, A. P. Brinkley, Jr., and Hall H. Brinkley.

THE WOODWARD-WIGGINS ELECTRIC COMPANY of Orangeburg, S. C., has been incorporated with a capital stock of \$9,000 by J. L. Woodward and J. C. Wiggins, both of Orangeburg.

THE ROCK CITY ELECTRIC COMPANY of Nashville, Tenn., has been incorporated by J. C. Campbell, W. C. Campbell, H. S. Sumner and others. The company is capitalized at \$50,000.

THE D. & F. ELECTRICAL ENGINEERING COMPANY of Ogdensburg, N. Y., has been incorporated by S. J. Delaney, F. J. Francis and A. T. Whalen of Ogdensburg, N. Y. The company is capitalized at \$10,000.

THE AMERICAN AUTOMATIC SIGNAL COMPANY of New York, N. Y., has been incorporated with a capital stock of \$350,000 by S. B. Howard, G. V. Reilly and A. W. Britton, 28 Nassau Street, New York City.

THE NATIONAL GAS & POWER COMPANY of Indianapolis, Ind., has been incorporated by E. C. Lewis, W. W. Wiswell and J. B. Detwiler. The company is capitalized at \$100,000 and proposes to generate and distribute electricity.

THE GRAFTON (ILL.) ELECTRIC LIGHT & POWER COMPANY has been chartered with a capital stock of \$10,000 by William J. Brower, Robert L. Mayensburg, August Miller, D. C. Slaten, John N. Eastman, E. P. Edsall and H. A. Patton.

THE SANTO DOMINGO ELECTRIC LIGHT & POWER CORPORATION of New York, N. Y., has been incorporated with a capital stock of \$300,000 to generate and distribute electricity. The incorporators are: Alex. A. Oldrini, Jose A. Losada and Zachary M. Delman.

THE UNITED STATES ELECTRICAL SUPPLY COMPANY of Peoria, Ill., has been organized with a capital stock of \$100,000 to do a general electrical contracting business. Walter O. Ireland is to be president of the new company and B. P. Crawley vice-president.

THE OHIO TUEC VACUUM CLEANER COMPANY of Toronto, Ont., Can., has been chartered with a capital stock of \$50,000 to manufacture vacuum cleaners, machinery, etc. The incorporators are: Joseph M. Bullen, 44 King Street West; Harold L. Steele, Wendell Osborne and others.

THE ACME ENGINEERING COMPANY of Toronto, Ont., has been incorporated by Ewart Lynch, Traders' Bank Building; D. B. Coleman, F. A. D. Campbell and others. The company is capitalized at \$125,000 and proposes to manufacture machinery, tools, electrical equipment, etc.

THE CHICKASAW (ALA.) UTILITIES COMPANY has been incorporated with a capital stock of \$50,000 as a subsidiary of the Tennessee Coal, Iron & Railroad Company. The officers are: George G. Crawford, president; H. C. Ryding, vice-president; L. T. Beecher, secretary and treasurer, all of Birmingham.

New England States

DENMARK, ME.—A joint petition has been made to the Public Utilities Commission by the Denmark (Me.) Light & Power Company and the Western Maine Power Company of Limerick, asking authority for the latter to purchase the property and holdings of the former.

PORTSMOUTH, N. H.—Bids will be received at the Bureau of Yards and Dock, Navy Department, Washington, D. C., until March 25 for furnishing and supervising the installation of two 700-gal. per minute electrically driven centrifugal booster pumps and equipment at the navy yard, Portsmouth. Drawings and specifications No. 2846 may be obtained on application to the above bureau or to the commandant of the navy yard named.

BOSTON, MASS.—The Tileston & Holingsworth Company, paper manufacturers, 49 Federal Street, is changing the motive power of its plant at 892 River Street, Hyde Park, from steam to electricity. The work consists of a new transformer house, new reinforced concrete motor and other machinery foundations. The Aberthaw Construction Company, 27 School Street, Boston, has the contract.

IPSWICH, MASS.—At the annual town meeting held recently the Water and Light Commissioners were authorized to extend both the water and electric systems.

NEW BEDFORD, MASS.—The Union Street Railway Company has awarded contract to the J. W. Bishop Company of Worcester for the construction of the superstructure of a building to be used as a boiler house and turbine room. The building will be 98 ft. by 126 ft., and will cost about \$135,000.

NEWBURYPORT, MASS.—Application has been made by the New England Telephone & Telegraph Company to the Council or permission to construct an underground conduit and erect pole lines for distributing purposes on State Street from High Street to the Newbury line and on intersecting streets.

PAWTUCKET, R. I.—Preparations are being made for the construction of a new power plant in the rear of Park Place to furnish light and heat for the large business blocks of the Taylor Estate in Main and Broad Streets. The new power plant is made a necessity owing to the decision of the Blackstone Valley Gas & Electric Company to abandon its heating plant next fall.

GROTON, CONN.—The Public Utilities Commission has granted the petition of the Shore Line Electric Railway Company to supply electricity to the Croton Iron Works for its shipbuilding plant. The borough municipal plant is not able to furnish an adequate supply.

Middle Atlantic States

BINGHAMTON, N. Y.—The Public Service Commission has granted the Binghamton Light, Heat & Power Company permission to sell \$100,000 refunding and improvement bonds.

BUFFALO, N. Y.—Plans are being prepared by the Lackawanna Steel Company for the construction of a central turbo-generator power plant, 100 ft. by 190 ft., one story high, to cost about \$200,000.

BUFFALO, N. Y.—Contracts have been awarded by the Transmission Ball Bearing Company, 1050 Military Road, Buffalo, for a one and two-story addition, 175 ft. by 350 ft., to its plant at Military Road and the Central Railroad, to cost about \$150,000.

BUFFALO, N. Y.—Plans are under consideration by the City Council for equipping the Buffalo Belt Line for electrical operation in order to increase the efficiency of the system for the transportation of workmen to the various plants engaged upon war contracts.

BUFFALO, N. Y.—Plans have been completed by the New York Telephone Company for the acquirement and operation of the systems of the Federal Telephone & Telegraph Company, the Niagara County Home Telephone Company and the Chautauqua County Telephone Company of Buffalo.

NEW YORK, N. Y.—Permit has been taken out by the New York Edison Company for the erection of a repair shop, 50 ft. by 70 ft., at 720 First Avenue.

NEW YORK, N. Y.—The Long Island Lighting Company has petitioned the Public Service Commission for permission to purchase the properties of the Sag Harbor (N. Y.) Light & Power Company and the Riverhead (N. Y.) Electric Light Company.

NEW YORK, N. Y.—The Emergency Fleet Corporation has awarded the Lord Construction Company, 105 West Fortieth

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

Street, New York, N. Y., a contract for fitting out twenty wooden hulls being built at various shipyards. The work will include the installation of engines, boilers and all similar equipment and supplies.

NORWICH, N. Y.—The Public Service Commission has granted the Norwich Gas & Electric Company permission to issue \$80,000 in bonds and \$38,500 in capital stock.

UTICA, N. Y.—A committee has been appointed by Mayor Smith to investigate the proposal that the city of Utica develop the water powers in nearby streams and erect an electric transmission line to the city. The plan contemplates using the power developed to operate war industries here.

AMPERE, N. J.—A permit has been taken out by the Crocker-Wheeler company for the construction of an extension to its power house.

CAMDEN, N. J.—A permit has recently been taken out by the New York Shipbuilding Company for the erection of an addition, 110 ft. by 115 ft., to the power house at its plant.

HACKENSACK, N. J.—The Gas & Electric Company of Bergen County has petitioned the Board of Public Utility Commissioners for permission to issue \$700,000 in bonds, the proceeds to be used for extensions, improvements, etc., in its plant and system.

HOBOKEN, N. J.—Plans are being prepared for the erection of a building near Fourteenth Street, Hoboken, for the United States government, to cost about \$1,000,000. It will be used for the manufacture of army equipment, as well as for storing, handling and shipping of materials, and will be known as the Expeditionary Depot.

NEWARK, N. J.—Plans are under consideration by the City Commission for the installation of a new heating plant in the City Hall at once. The proposed plant will furnish heat for the police headquarters soon to be formally opened.

PERTH AMBOY, N. J.—Plans have been filed by the American Smelting & Refining Company for the construction of an addition, about 60 ft. by 70 ft., to the power house at its plant at Maurer. Contract for construction of building has been awarded to Ira Crouse, 495 State Street, Perth Amboy.

FITMAN, N. J.—The Board of Public Utility Commissioners has given its approval to the application of the Electric Company of New Jersey for a bond issue of \$197,000, the proceeds to be used for extensions, improvements, etc.

TRENTON, N. J.—The City Commissioners are considering plans for operating under municipal ownership the system of the Trenton & Mercer County Traction Corporation.

BRADFORD, PA.—A portion of the power plant of the Boviard & Seyfang Manufacturing Company was recently destroyed by fire, causing a loss of about \$10,000.

COALDALE, PA.—Plans are being prepared by Louis Stockton, architect, 35 West Thirty-ninth Street, New York City, for an addition, 40 ft. by 60 ft., to the power house of the Panther Creek Valley Hospital.

COLLEGEVILLE, PA.—The entire electrical equipment of the power house of the Reading Transit & Light Company at Collegeville has been purchased by Henry Potts & Company, 650 Real Estate Trust Building, Philadelphia, Pa.

EASTON, PA.—The Pennsylvania Utilities Company has completed the erection of a new tie line between its system and that of the Lehigh Valley Transit Company at Allentown. A section of the new line, which will provide for an interchange of about 1200 kw., facilitating operation in event of a breakdown in either system, has been equipped for 13,200 volts, and the remainder for 33,000 volts.

HARRISBURG, PA.—The Harrisburg Railways Company in connection with other improvements to its plant will begin work on the installation of automatic stokers in its main power plant and substation at Reily and Marion Streets.

HARRISBURG, PA.—Application has been filed with the Public Service Commission by the Penn Mills Light, Heat & Power Company, the Bernville Light, Heat & Power Company and the Jefferson Light,

Heat & Power Company, all of Berks County, to consolidate.

HARRISBURG, PA.—Application has been filed with the Public Service Commission for permission to consolidate the following companies: The Port Allegheny Power Company, the Liberty Township Power Company, the Smithport Power Company, the Lafayette Township Power Company, the Bradford Township Power Company and the Keating Power Company, all of McKean County.

PHILADELPHIA, PA.—Contract has been awarded by the Philadelphia & Reading Railway Company for the construction of a power house, one and two story, at Tulio and Somerset Streets, to the F. W. Mark Construction Company.

WAYNESBORO, PA.—The Chambersburg, Greencastle & Waynesboro Railway Company has taken out a permit for the construction of a new substation, 10 ft. by 50 ft., two stories high. The cost is estimated at about \$10,000.

WILMINGTON, DEL.—Notice has been filed with the People's Heat, Light & Power Company of a change in name to the Seaboard Electric Company.

WILMINGTON, DEL.—Preparations are being made by the Sugar Refining Company for the erection of a large power house in connection with its proposed new sugar refinery on the Delaware River, for which preliminary plans are being prepared. The cost of the entire project is estimated at about \$10,000,000.

PRINCETON, W. VA.—The City Council is considering replacing the arc lamps now in use with incandescent electric (three-lamp clusters) lamps.

HAMPTON ROADS, VA.—Plans are being prepared by the Bureau of Yards and Docks, Navy Department, Washington, D. C., for the installation of a new fire alarm system at the local yards.

NORFOLK, VA.—Plans have been prepared for additions to the Norfolk Navy Yard, consisting of a new pattern shop, to cost about \$600,000, and a power plant, to cost \$575,000, and auxiliary structures.

PETERSBURG, VA.—The Virginia Railway & Power Company is planning to erect an electric transmission line from Petersburg to Norfolk to supply electricity in Petersburg and Norfolk and to the towns between the two cities. The cost of the work is estimated at about \$750,000. Contracts, it is understood, will soon be awarded for the proposed work. The proposed line will provide connections with the three power plants in the cities of Richmond, Norfolk and Petersburg. In case of accidents to any of the plants service can be supplied by the two other stations.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Brooklyn, N. Y., Schedule 1724—50,700 ft. lead-covered wire, 400,000 ft. twisted lamp cord, 37,000 lb. weatherproof wire, and 202,500 ft. rubber-covered wire; Schedule 1725—140,000 ft. double, duplex armored wire, 800,000 ft. double duplex leaded wire, 70,000 ft. double duplex plain wire, 158,000 ft. leaded and armored single conductor wire, 262,000 ft. single conductor wire, 21,000 ft. interior communication wire, and 113,000 ft. interior communication leaded and armored cable. Philadelphia, Pa., Schedule 1725—a quantity of magnet wire. Application for proposal blanks should designate the schedule desired by number.

North Central States

ASHTABULA, OHIO.—The residents on Bancroft Street have petitioned the City Council for sidewalks, grading and electric lamps for that thoroughfare.

BUCYRUS, OHIO.—Preparations are being made by the Bucyrus Light & Power Company to increase the output of its plant. Work will begin at once on the installation of machinery capable of developing 2500 kw., which will increase the capacity of the plant by 150 per cent. The present output of the plant is 1750 kw.

CANTON, OHIO.—A tentative site, it is announced, has been selected for the new roundhouse and power plant to be erected in connection with the freight yards under construction by the Wheeling & Lake Erie Railway Company, to cost about \$500,000. The cost of the power plant and roundhouse is estimated at about \$250,000.

CINCINNATI, OHIO.—Plans are being prepared by the United States Electrical Tool Company for an addition to its factory, 60 ft. by 100 ft.

CINCINNATI, OHIO.—Two 30,000-kva. units of the new 125,000-kva. generating

plant of the Union Gas & Electric Company, now under construction, will be placed in operation this summer. Work on the new 13,200 volt transmission system is nearly completed. C. W. De Forest is manager of the electrical department.

CLEVELAND, OHIO.—Bids will be received at the office of the commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until March 22, for electric meters. Specifications may be obtained at the office of the division of light and heat.

COLUMBIA, OHIO.—The Columbia Gas & Electric Company has been awarded the contract to furnish electricity to operate the motor-driven pumps to be installed at the auxiliary water-works pumping station.

FREMONT, OHIO.—The Ohio State Power Company is building a large addition to its Ballville plant, which when completed will increase the output to 24,000 hp.

GERMANTOWN, OHIO.—The Town Council, it is reported, has asked the Dayton Power & Light Company to prepare plans showing how the company would light the town, and to submit a schedule of prices for both municipal and private lighting service. Thomas F. Keely is representative of the company.

SANDUSKY, OHIO.—The Sandusky Gas & Electric Company has secured a contract from the Brightman Nut & Manufacturing Company to supply electricity (125 hp.) to operate the plant of the latter.

WATERVILLE, OHIO.—The Defiance (Ohio) Gas & Electric Company is contemplating extending its service to the village of Waterville. Application has been made by the company to the Commissioners of Lucas and Wood Counties for permission to place lamps on the Waterville bridge.

YOUNGSTOWN, OHIO.—The Mahoning & Shenango Railway & Light Company is considering plans for the reconstruction of its line between Sharon and the Wheatland Borough limits, to cost about \$150,000.

MAYFIELD, KY.—The city of Mayfield has taken over the water and light plants of the Mayfield Water & Light Company to be owned and operated by the municipality.

ANDERSON, IND.—Improvements to be completed by the Union Traction Company of Indiana during 1918 include the erection of a transmission line and other apparatus for operating the Muncie-Portland line with energy from the central power plant at North Anderson.

COLUMBUS, IND.—Work is now under way for replacing the street arc lamps now in use with electric incandescent street lamps.

ELKHART, IND.—The St. Joseph Valley Railway Company, it is reported, is contemplating the construction of an extension of its line from Elkhart to Toledo.

INDIANAPOLIS, IND.—The contract for furnishing and erecting eight bronze standards of special design for the Dewey Memorial Fountain has been awarded to the Hatfield Electric Company of Indianapolis, at \$4,476.

CHICAGO, ILL.—The Public Utilities Commission has authorized the Public Service Company of Northern Illinois to issue \$1,334,000 refunding mortgage bonds.

CHICAGO, ILL.—The Ilg Electric Ventilating Company has purchased a site at Elston Avenue and Snow Street, Chicago, on which it will erect a group of manufacturing buildings, to cost about \$750,000. Plans are being prepared by Lehenbaum, Marx & Vigeant, architects, 175 West Jackson Boulevard, for the proposed buildings, which will be built in units 60 ft. by 300 ft., connected by passageways.

HARRISBURG, ILL.—The Public Utilities Commission has granted the Southern Illinois Light & Power Company permission to issue \$279,000 in bonds and \$402,100 in capital stock. The company was also given a certificate of convenience and necessity to operate a plant.

BUTTERNUT, WIS.—The Butternut Electric Light & Power Company is planning to install an additional 3-wire generator of about 15 kw. capacity and a kerosene oil engine with a rating of from 20 to 25 hp. this year. W. J. Schulz is manager.

MILWAUKEE, WIS.—Plans are being prepared by the A. C. Electric & Novelty Company, 224 Fourth Street, Milwaukee, for rebuilding its plant and warehouse, which was recently damaged by fire, causing a loss of about \$25,000. Much of the equipment was badly injured and will have to be replaced.

NEENAH, WIS.—The City Council is considering the purchase of electrical equipment for the city stone quarry.

PINE CITY, MINN.—Improvements are contemplated by the Eastern Minnesota Power Company, consisting of the installation of a 500-kw. steam turbine, also de-

veloping a water power and the erection of a 10-mile electric transmission line to connect with its present plant.

ST. PAUL, MINN.—Contracts have been closed by the Northern States Power Company for furnishing electricity (22,000 hp.) for industrial motors. With the exception of two munition plants, it is stated that the new business is of a permanent character.

TROMMALL, MINN.—The installation of an electric-lighting system in the new town of Trommald is reported to be under consideration.

VIRGINIA, MINN.—Plans are being considered by the Virginia Board of Education for the installation of an electric light and power plant in connection with the new school building.

DEBUIQUE, IOWA.—The power plant of the Farley & Loetscher Company was recently damaged by fire, causing a loss of about \$20,000.

DUNLAP, IOWA.—Bids will be received by the Board of Education of Dunlap until April 10 for the construction of a high school building, including electric wiring, vapor steam heating, plumbing, etc. The cost of the building is estimated at about \$75,000. J. H. Craddock & Company, 504 Farnum Building, Omaha, Neb., are architects.

SCOTLAND, S. D.—At an election held recently the proposal to issue \$35,000 in bonds for the installation of a municipal electric light plant was defeated. Electrical service is now furnished by the South Dakota Light & Power Company of Armour. Improvements, it is understood, will now be made to the local system.

KANSAS CITY, MO.—The Interurban Central Station Company has filed a bond of \$50,000, thus assuring the erection of the new interurban union station at Tenth and McGee Streets.

KANSAS CITY, MO.—A permit has been taken out by the Kansas City Light & Power Company for the construction of its proposed new plant at Front Street and Park Avenue. The new building will be 244 ft. by 185 ft., four stories high. The cost of the first unit is estimated at \$1,700,000.

ST. JOSEPH, MO.—The Lawhon, Stamey Construction Company, 905 Edmond Street, St. Joseph, has been awarded the general contract for construction of a department store, to be erected at the corner of Sixth and Francis Streets, to cost about \$200,000. Contract for electric wiring and elevators has not yet been awarded.

BUNKER HILL, KAN.—The installation of a municipal electric-light plant in Bunker Hill is under consideration.

YATES CENTER, KAN.—The City Council has adopted ordinances providing for submitting the question of municipal ownership of the water works, electric-light plant and ice plant to the voters at the coming election.

Southern States

BADEN, N. C.—The Tallassee Power Company, it is reported, will erect 300 additional buildings at its plant this spring.

BLADENBORO, N. C.—The Town Commissioners have made arrangements with the Bladenboro Cotton Mills for furnishing electricity for lighting the streets of the town. Electric wires have been erected, and it is understood that contract has been placed for lamps.

PINE LEVEL, N. C.—The Citizens' Power & Light Company will erect 13 miles of electric transmission line, connecting up two towns, one having a population of 2500 and the other 5000. A substation will be erected in each town. C. I. Goodwin is owner.

SUMTER, S. C.—The City Council has authorized Mayor Jennings to engage an engineer to make investigations and estimates of the cost of establishing a municipal electric-light plant with a view of calling an election to submit the proposal to establish a municipal electric plant to the voters.

JACKSONVILLE, FLA.—The City Commission has adopted the resolution providing for the extension of the electric transmission lines of the municipal electric-light plant to the shops of the Seaboard Airline Railroad Company to furnish electricity. The railroad agrees to pay the cost of erecting the transmission line, which is estimated at about \$15,000.

COLUMBIA, TENN.—Options on sites and land on Duck River have been obtained by M. R. Stern, engineer of Nashville, representing capitalists who have developed water power in a number of towns in middle and east Tennessee. The proposed

plant will be located on the site now known as the Ashton Mills, on the north edge of Columbia. The dam, which is 6 ft. high, will be raised 6 ft.

HADLEY'S BEND, TENN.—The contract for the electrical equipment for the power plant to be erected for the United States government at Hadley's Bend has been awarded to the Western Electric Company. The total cost of the electrical equipment is estimated at \$5,000,000.

KNOXVILLE, TENN.—The installation of new electric lamps in the newly acquired territory of Greater Knoxville will soon be completed. Since the work was started last August 446 lamps have been erected.

SEWANEE, TENN.—The telephone exchange building of the Sewanee Telephone Company was recently damaged by fire.

BIRMINGHAM, ALA.—A. T. Newell & Brothers, it is reported, have been awarded the contract for the construction of the Alabama Interurban Railway from Birmingham to the Warrior River, a distance of about 20 miles. Thomas L. Cannon of Birmingham is president of the railway.

KOSCIUSKO, MISS.—The Planters' Oil Mill & Gin Company is contemplating the purchase of coal-handling and unloading machinery.

SHREVEPORT, LA.—The installation of additional equipment is reported to be under consideration by the Elliott Electric Company of Shreveport.

BROKEN ARROW, OKLA.—The Oklahoma Public Service Corporation has applied for a franchise to install an electric light and power plant in Broken Arrow. The granting of the proposed franchise will be submitted to the voters on March 26.

SHATTUCK, OKLA.—Plans are being considered for rebuilding the municipal electric-light plant and water-works system for which bids will soon be asked. The proposed work consists of the installation of either oil fuel or steam plant for lighting system and rebuilding all water mains. The cost is estimated at \$75,000.

DALLAS, TEX.—The erection of a new telephone exchange building is under consideration by the consolidated telephone companies. The plans provide for an 18-story building.

EAGLE PASS, TEX.—The Eagle Pass Ice Manufacturing Company is contemplating the installation of additional machinery to cost about \$20,000.

HOUSTON, TEX.—Contract has been awarded by the City Council for the construction of the first unit of the proposed municipal street railway from a connection with the International & Great Northern Railroad north of Harrisburg Boulevard to the plant of the Sinclair Gulf & Refinery Company east of Simms Bayou (4 miles), to the Houston Construction Company, at \$59,000.

LUBBOCK, TEX.—Extensions are contemplated to the municipal electric light plant, including the installation of an additional 200-hp. oil engine and generator, bids for which will be called for early in April. C. E. Parks is Mayor.

MCALLEN, TEX.—The Mutual Irrigation Company contemplates the construction of an irrigation system in this vicinity and also the installation of a pumping plant, to cost about \$50,000.

Pacific and Mountain States

KELSO, WASH.—The district office of the North Coast Power Company, formerly at Kalama, will be transferred to Kelso. F. A. Peterson will assume the management of the Kalama office.

RITZVILLE, WASH.—The Intermountain Power Company has petitioned the Commissioners of Adams County for a franchise to erect and operate electric transmission lines over certain highways in Adams County.

SEATTLE, WASH.—The Lighting Department of the city of Seattle has secured a contract to supply 2500 hp. to the shipyards of the Erickson Engineering Company. This company will construct steel ships.

SEATTLE, WASH.—Bids will be received by the purchasing agent of the Alaskan Engineering Commission, 422 Bell Street Dock, until March 25 for furnishing electrical supplies as follows: For 6600 ft. conduit, 40,000 insulators, 25,000 ft. 5/8-in. cable, and approximately 100,000 ft. of wire.

SNOHOMISH, WASH.—Mayor J. W. Hall has publicly announced that he is in favor of a movement to utilize water power of the county for municipal electric-light plants, asserting that Snohomish can obtain 5000 hp. from the dam of the city

avity pipe line. The Commercial Club also back of the project.

VANCOUVER, WASH.—The Portland Railway, Light & Power Company contemplates an extension of its 11,000-volt commercial feeder line to pick up 2000 hp. steel shipbuilding load. F. H. Gay is division manager.

WALLA WALLA, WASH.—Further improvements are contemplated by the Pacific Power & Light Company to its local system. The company is building a new switching station at Pasco, which when completed will improve the service in Walla Walla.

MORO, ORE.—The Farmers' Elevator Supply Company of Moro is contemplating the construction of two elevators at Moro, to cost about \$70,000. The cost of the equipment is estimated at about \$12,000.

PORTLAND, ORE.—What may become the first unit of a municipal power plant now under construction by the Water Bureau at the headworks of the Bull Run water system. Plans have been prepared for the installation of a 4-kw. electric plant for lighting the buildings at the headworks. L. M. Kaiser, superintendent of the water bureau, has charge of the work.

BISHOP, CAL.—A mill will be built at the camp at the Pine Creek tungsten claims, recently secured by the Cooper Lumber Co. of the Round Valley Tungsten Company. Two Marcy mills with a combined capacity of 150 tons daily will be installed. Arrangements, it is understood, have been made with the Southern Sierras Power Company for furnishing electricity to operate the proposed mills. To furnish a service a transmission line 12 miles long will be erected.

FRESNO, CAL.—Application has been made by the San Joaquin Light & Power Company with the State Water Commission for 250 second-feet of water in addition to that already used by the company from the Kern River. A new plant to increase its present output by 20,000 hp. is to be erected at the mouth of Kern River Canyon, to cost about \$1,500,000.

FRESNO, CAL.—Application has been made with the State Railroad Commission by the San Joaquin Light & Power Company for authority to issue \$1,000,000 in bonds, the proceeds to be used to complete additional facilities upon which work has already started. Among them is plant No. 2, near North Fork.

KNIGHTS FERRY, CAL.—Plans are being considered to reopen the old power plant at Knights Ferry, which was closed down over 12 years ago. The Railroad Commission has asked that this plant be reopened, as it will be a means of conserving water. The plant is owned by the Sierra and San Francisco Power Company. H. F. Jackson, 58 Sutter Street, San Francisco, is general manager.

LOS ANGELES, CAL.—Twenty-three ordinances providing for the installation of ornamental lamps on as many thoroughfares have been adopted by the City Council.

LOS ANGELES, CAL.—The Public Service Commission has authorized the leasing from the Harbor Commission of a tract of land on the east side of the Harbor boulevard, adjoining the Los Angeles Dry Dock & Shipbuilding Company on the west side, to be used as a site for a substation for the municipal power system. This station will furnish power service to industries around the west basin and to the No. 1 and across the channel in the Wilmington district.

OAKLAND, CAL.—All wires in the Lake district between Wesley Avenue and Cottage Street are being placed underground.

RIVERSIDE, CAL.—The Southern Sierras Power Company has petitioned the State Railroad Commission for permission to purchase and incorporate under its management the Corona (Cal.) Gas & Electric Company, the Rialto (Cal.) Light & Power Company and the Bishop (Cal.) Light & Power Company.

VENICE, CAL.—The City Council will advertise the sale of a ten-year franchise to operate an electric railway on the ocean front.

BONNERS FERRY, IDAHO.—John E. Rice & Company of Seattle, Wash., have taken an option on the holdings of the Bonner Water & Light Company of Bonners Ferry, the price being placed at \$135,000.

TWIN FALLS, IDAHO.—Plans are being considered by the citizens of Twin Falls, Idaho, and Filer for establishing a mutually owned electric light and power plant to serve this district. It is proposed to take over the plans and plants of the Mutual Light, Heat & Power Company, recently organized to develop and furnish electricity to its stockholders at cost of production; also taking over the partially developed power site at Clear Lake on Snake

river north of Buhl, owned by W. C. Hazzard. A committee has been appointed to enter into negotiations with Mr. Hazzard for the purchase of the property.

BRIGHAM, UTAH.—The electric light committee is contemplating removing the lamp poles from the center of the street to the curb line in the business section of the city. C. O. Roskelly is manager of the municipal electric-light plant.

TOOELE, UTAH.—The Utah Lime & Stone Company is negotiating with the Clark Electric Power Company of Tooele to extend its electric transmission lines to Flux and Dolomite to furnish electricity to operate its factories at those places. The lines of the Clark company now extend within 7 miles of the property of the Utah Lime & Stone Company.

KINGMAN, ARIZ.—Surveys are being made by the Desert Power & Water Company for the proposed extension of its electric transmission lines from the generating station in Kingston to the Hackberry mining district, a distance of 33 miles.

CHESTER, MONT.—A petition is being circulated by the residents of Chester and Joplin to be presented to the Montana Power Company, asking that the electric transmission line of the company be extended from Havre to Shelby, taking in Chester and Joplin. Both towns have electric generating plants, but are unable to meet the demands made upon them.

CASPER, WYO.—The Natrona County Electric Company and the Wyoming Electric Company, both of Casper, have been consolidated under the name of the Natrona Power Company. The concern is capitalized at \$1,000,000 and furnishes electricity to the Casper district. Patrick Sullivan of Casper is president; E. P. Bacon of Logan is vice-president and manager.

WHEATLAND, WYO.—Bonds have recently been voted for the installation of a municipal electric-light plant in Wheatland.

YERINGTON, NEV.—Application has been made to the State Water Commission by A. M. Wishart, Alexander Cameron and James Herrin of Yerington to impound 20 second-ft. of the waters of Sweetwater Creek in Mono County. They propose to build a dam 10 ft. high and 43 ft. long, and running from the pool so formed is to be a metallic flume 3 1/2 miles long. It is estimated that 2575 hp. will be developed.

GALLUP, N. M.—The Town Board is considering calling an election to vote on the proposal to establish a municipal electric-lighting plant. An engineer will be employed by the town to estimate cost of plant and other necessary data.

Canada

KASLO, B. C.—The question of establishing a 24-hr. service in connection with the municipal electric-light plant is under consideration. Fred D. Emory is chief engineer.

MURRAYVILLE, B. C.—The Laking Mills, destroyed by fire some time ago, are being rebuilt and will be equipped for electrical operations.

REVELSTOKE, B. C.—The city of Revelstoke is considering putting in new sluiceways and new head racks at dam. Correspondence is invited from contractors and dealers interested in this work. C. North is manager.

TRAIL, B. C.—The West Kootenay Power & Light Company is contemplating the construction of new lines and improvements to its system in Trail and vicinity, involving an expenditure of about \$30,000.

VICTORIA, B. C.—Bids are being received by City Purchasing Agent Galt for a supply of globes for arc lamps and nitrogen lamps for the light and power department.

FREDERICTON, N. B.—Application will be made for a charter for the construction of a new car line from the St. John Valley Road at a point near Pokioik to a connection with the proposed Eastern Maine Railway at a point near the international boundary at North Lake in Orient, Aroostook County, a distance of 24 miles. The plans provide for generating and distribution of hydroelectric power. The Eastern Maine Railway Company of Bangor, Me., is reported interested in the project.

HALIFAX, N. S.—The intention of the Dominion government to establish a steel shipbuilding plant at Halifax has been announced by the Department of Public Works. Extensions to drydock and repairs will be made to Piers Nos. 3 and 4, for which contract has been awarded to the Cook Construction Company.

CORNWALL, ONT.—The Board of Trade has sent a resolution to the Hydro-Electric Power Commission of Ontario, the Dominion and Ontario Premiers and Frank

Carvell, minister of Public Works, asking that action be taken as soon as possible with reference to the development of Longue Sault Rapids for power purposes.

OTTAWA, ONT.—Tenders will be received by John A. Pearson, architect, and J. O. Marchand, associate architect, Parliament Buildings, Ottawa, Ont., Can., until March 25 for switchboards, panelboards and transformers required in the reconstruction of the Parliament Buildings. Plans and specifications and other information may be obtained at the office of the general contractor, P. Lyall & Sons Construction Company, Ottawa.

PORT DOVER, ONT.—The installation of an electric system (Hydro-Electric power) is reported to be under consideration by the Town Council.

TILSONBURG, ONT.—The main building of the plant of the Huntley Manufacturing Company in Tilsonburg was recently destroyed by fire, including machinery, tools and completed elevator machinery, causing a loss of several hundred thousand dollars. The main plant of the company is located at Silver Springs, N. Y.

TORONTO, ONT.—The Alloy Steel Works are reported to be considering the installation of a six-ton electric furnace in the near future.

TORONTO, ONT.—The government of Ontario has appropriated \$9,054,000 for hydroelectric development in this Province. Of this \$4,175,000 is for Niagara Falls development, including the Chippewa-Queenston project, and \$2,896,000 for extensions to the Niagara Falls system, which includes the radial railway from Welland to Port Colborne, to Port Erie and Bridgeburg. The Hydro-Electric Commission, it is expected, will not require all this amount in 1918. The Chippewa-Queenston power canal, it is hoped, will be completed by 1921. The radial lines, it is understood, will not be built during the war.

TORONTO, ONT.—Plans have been prepared by the Imperial Oil Company, 56 Church Street, Toronto, for the erection of a pump house, to cost about \$5,000, and a boiler house, to cost \$10,000.

MONTAGUE, P. E. I.—The Montague Electric Company is being reorganized. The capital stock has been increased from \$10,000 to \$25,000 and new machinery installed in the plant. Work on improvements has not yet been fully completed and considerable house wiring is yet to be done.

MONTREAL, QUE.—The Southern Canada Power Company is contemplating the purchase of a 150-kw. and a 300-kw. motor-generator set (second hand), the generator end 250 volts, direct current, motor end three phase, 60 cycles, 220 volts, synchronous motor, or separate machines of identical capacities and characteristics. L. C. Haskell is purchasing agent.

ST. LAMBERT, QUE.—Work, it is understood, will be started this summer on the new plant of the Dominion Textile Company. The cost of the building is estimated at \$3,000,000.

THREE RIVERS, QUE.—Prices are being asked by the city of Three Rivers on a 3000-gal. centrifugal pump, split case, one-stage, and a 200-hp. gasoline engine.

VERDUN, QUE.—Improvements are contemplated to the municipal electric-light plant and waterworks system to cost about \$50,000, for which, it is understood, bids will soon be asked.

MELFORT, SASK.—The purchase of a Diesel engine is under consideration by the Town Council.

MOOSE JAW, SASK.—The Council has appropriated \$20,400 for extensions to the municipal electric power plant as recommended by J. D. Peters, manager.

MOOSE JAW, SASK.—The Canadian Pacific Railway Company contemplates the erection of a mechanical coaling plant (400 tons capacity) in Moose Jaw, rebuilding and adding to the local stock yards; building new section houses, tool houses, stations, wells, and the grading of siding and road crossings in the yards west of the city.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until April 1 for lighting fixtures, bronze wire, annunciators, signal bells, connectors, push-button plates, reflectors, switches, conduits and covers, shades, fans, bends, cleats, conduits, elbows, oil heaters, oil pump, etc. Blanks and information relating to this circular (No. 1207) may be obtained from the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

(Issued Feb. 12, 1918.)

1,256,319. **ELECTROLYTIC CELL**; Thomas G. Hill, Seattle, Wash. App. filed Oct. 26, 1916. Transforms chlorides into perchlorates.

1,256,317. **SEMI-AUTOMATIC TELEPHONE EXCHANGE**; Carl A. W. Hultman, Stockholm, Sweden. App. filed March 18, 1916. Simplifies circuits and switching means so as to obtain reliable operation and a quick connection of the register with the junction.

1,256,332. **SWITCH MECHANISM**; Hubert P. Keantz, Brooklyn, N. Y. App. filed May 2, 1914. For use with either a push-button, lever throw or pull switch, particularly of the quick-make and quick-break type.

1,256,313. **ELEVATOR SIGNAL SYSTEM**; Alvin C. McNabb, Dallas, Tex. App. filed Oct. 23, 1915. Improvements.

1,256,362. **AUTOMATIC HEADLIGHT DIMMER FOR AUTOMOBILES**; Victor Olson, Naugatuck, Conn. App. filed March 21, 1916. Improved.

1,256,380. **MERCURY SWITCH**; Frederick W. Schmidt, Chicago, Ill. App. filed Oct. 19, 1914. Improvement.

1,256,105. **ROTARY - BLOWER SPARK GAP**; Harlan S. Webster, Canton, Ohio. App. filed March 3, 1917. Means for cooling the electrodes.

1,256,447. **TYPEWRITER ATTACHMENT**; David E. Dunkle, Norwich, Pa. App. filed April 28, 1916. Electrically operated carriage shifters for typewriters.

1,256,500. **TELEPHONE-EXCHANGE SYSTEM**; Henry P. Clausen, Mount Vernon, N. Y. App. filed April 27, 1916. Operation of a line-finder switch in hunting for a calling line will be inaudible to busy lines multiplied to the same group.

(Issued Feb. 19, 1918.)

1,256,511. **AUTOMATIC TELEPHONE SWITCH**; John G. Blessing and Bernard D. Willis, Chicago, Ill. App. filed March 16, 1912. Improved automatic switch and circuits for operating the same.

1,256,512. **SUBSTATION SWITCH HOOK**; John G. Blessing, Chicago, Ill. App. filed March 20, 1916. For automatic telephone systems.

1,256,545. **DOOR-LOCK-CONTROLLED ELECTRIC SWITCH**; John R. Folger, Detroit, Mich. App. filed Feb. 26, 1916. Designed to cut out the lights in a room when the door is locked.

1,256,546. **WALL SWITCH**; Charles Forth, Ottawa, Ontario, Canada. App. filed Feb. 2, 1916. Improvements.

1,256,554. **SYSTEM OF WIRELESS TELEPHONY**; Walton Harrison, New York, N. Y. App. filed Oct. 30, 1914. Improvements.

1,256,558. **MOTOR VEHICLE**; Frederic Hild, Denver, Col. App. filed Oct. 2, 1916. Improvements in various features of construction, including novel mountings for the wheel trucks, wheels and motors.

1,256,567. **INCANDESCENT LAMP WITH CONCENTRATED METALLIC FILAMENT**; Herman J. Jaeger, Weehawken, N. J. App. filed March 16, 1915. Improvements.

1,256,568. **METALLIC-FILAMENT LAMP FILLED WITH NITROGEN**; Herman J. Jaeger, Weehawken, N. J. App. filed March 17, 1916. Improvements.

1,256,571. **ELECTRIC HEATING DEVICE**; William K. Kearsley, Jr., Newark, N. J. App. filed Aug. 17, 1916. Cigar lighter.

1,256,587. **TELEPHONE SYSTEM**; Earl R. Neir and Bernard C. Groh, Chicago, Ill. App. filed March 20, 1916. Improvements.

1,256,591. **MEANS FOR INDICATING THE DISPLAY OF MOTION PICTURES**; Robert D. Pike, San Francisco, Cal. App. filed July 17, 1916. Improvements.

1,256,616. **ELECTROPNEUMATIC BRAKE**; Walter V. Turner, Wilkesburg, Pa. App. filed July 27, 1915. Relates to fluid-pressure brakes.

1,256,618. **FLUID-PRESSURE BRAKE DEVICE**; Walter V. Turner, Wilkesburg, Pa. App. filed March 28, 1917. Electrically controlled.

1,256,623. **REDUCTION OF ORES**; Sigurd Westberg and Emil Edwin, Christiania, Norway. App. filed Aug. 26, 1916. Relates to the reduction of oxide ores by means of reducing gases.

1,256,628. **ELECTRICAL SYSTEM OF DISTRIBUTION**; Joseph Woodbridge, Philadelphia, Pa. App. filed June 9, 1914. Storage battery is employed for supplying current to the circuit when the dynamo is shut down.

1,256,643. **HIGH-TENSION SUSPENSION INSULATOR**; Svend Barford, Oakland, Cal. App. filed July 26, 1915. Provides an insulator in which fracture from shearing strain is entirely eliminated.

1,256,698. **TELEPHONE-EXCHANGE SYSTEM**; Lewis H. Johnson, Bloomfield, N. J. App. filed May 25, 1917. Improved signaling means.

1,256,705. **INDUCTION MOTOR**; Justin Lebovitz, Oakley, Ohio. App. filed June 2, 1916. Self-starting type.

1,256,708. **TRANSMITTER**; Eugene H. Lowe, Modesto, Cal. App. filed Jan. 23, 1917. Resistance-varying elements are disposed in a vacuum chamber.

1,256,732. **RECORDING MECHANISM FOR RAILWAY - TRAFFIC - CONTROLLING APPARATUS**; Frank H. Nicholson, Wilkinsburg, Pa. App. filed Aug. 27, 1914. Improvements.

1,256,740. **FIRE ALARM**; Eugen Steiger, Zürich, Switzerland. App. filed April 22, 1916. Consists of the light box, sources of electricity, an electrically controlled switch or relay, and the audible or visible alarm device proper, or an extinguisher, such as a water-sprinkler system or the like.

1,256,749. **INCANDESCENT LAMP FIXTURE**; William C. H. Wefel, Denver, Col. App. filed Dec. 14, 1916. Designed for use in a circuit in which a number of lamps are connected in series.

1,256,758. **PROCESS OF REFINING SUGAR**; Robert R. Williams, Manila, Philippine Islands. App. filed Jan. 26, 1914. Pertains to an electrolytic process for the removal of any acids, bases or salts (electrolytes) from solutions of sugar for the purpose of increasing the purity of the sugar solution and facilitating further utilization.

1,256,795. **MULTIPOLAR MAGNETO**; Otto Heins, New York, N. Y. App. filed Dec. 24, 1915. Improvements.

1,256,796. **MULTIPOLAR MAGNETO**; Otto Heins, New York, N. Y. Improvements.

1,256,800. **CIRCUIT CONTROLLER**; Albert J. Horton, White Plains, N. Y. App. filed Feb. 5, 1912. Controlled by a common electromagnet.

1,256,802. **PROCESS OF EXTRACTING ZINC FROM ITS ORES**; Edvin A. Johansson, Trollhättan, Sweden. Improvements.

1,256,804. **MAGNET-GROUPING DEVICE FOR ELECTRICAL MUSICAL INSTRUMENTS**; John F. Kelly, Pittsfield, Mass. App. filed Sept. 24, 1912. Type in which a perforated note or music sheet is employed to control the operation of the electromagnets.

1,256,813. **CONNECTING MEMBER FOR ELECTRICAL CONDUCTORS**; Harry T. Martin, Milwaukee, Wis. App. filed Oct. 27, 1916. Improvements.

1,256,814. **PERMUTATION ELECTRIC SWITCH**; Sigurd O. Mattison, Eau Claire, Wis. App. filed Dec. 4, 1916. May be actuated to connect two of a series of contact members selectively.

1,256,817. **AUTOMATIC TELEPHONE SYSTEM**; Frank Newforth, Jr., Chicago, Ill. App. filed Sept. 18, 1914. Improvements.

1,256,832. **FLUID RHEOSTAT**; Michael N. Schonwitz, Milwaukee, Wis. App. filed June 26, 1916. Fluid or electrolytic type.

1,256,842. **SYSTEM OF CONTROL**; Norman W. Storer, Pittsburgh, Pa. App. filed Nov. 12, 1915. Regenerative.

1,256,863. **ELECTRIC CONDUCTOR**; Charles J. Beaver and Ernest A. Claremont, High Leigh, England. App. filed July 19, 1915. Saves the waste of copper involved in enlarging the cross-section area of the cable and at the same time secures, on the one hand, the necessary flexibility

and, on the other hand, the security from distortion necessary in a high-voltage cable.

1,256,864. **COMPOSITION OF MATTER**; Julius Becker, Chicago, Ill. App. filed Nov. 27, 1915. Well adapted for use as a separation material for plates in electric secondary cells and the like.

1,256,875. **PROCESS FOR PRODUCING AMMONIA**; Alexander Classen, Aix la Chapelle, Germany. App. filed Oct. 8, 1915. Operates by the action of electric discharges.

1,256,889. **WIRELESS DUPLEX SIGNALING SYSTEM**; Lloyd Espenschied, Hollis, N. Y. App. filed May 15, 1916. Provides a system for the simultaneous transmission and reception of signals and in particular to afford means for duplex communication between two stations.

1,256,912. **CONTINUOUS CURRENT GENERATOR**; Frans G. Liljenroth, Westera, Sweden. App. filed May 20, 1916. Applies particularly to shunt or separately excited generators of that type.

1,256,929. **PROCESS OF PRODUCING METALLIC WIRES, FILAMENTS AND THE LIKE**; Otto Schaller, Berlin, Germany. App. filed May 16, 1914. Improved.

1,256,930. **FILAMENT OF WIRE FORMED OF A SINGLE CRYSTAL**; Otto Schaller, Berlin, Germany. App. filed May 16, 1914. Produced in passing a crystalline or a fibrous structure, through a short zone of intense heat, at a certain speed.

1,256,935. **PROCESS OF PRODUCING NITROGEN COMPOUNDS OF METALS**; Mathias Sem. Christiania, Norway. App. filed Nov. 21, 1916. Operates by the action of gaseous nitrogen upon carbides and has for its object a continuous process of producing such compounds by producing a suspension or cloud of pulverulent carbide in a current of gaseous nitrogen.

1,256,950. **ACCELERATOR**; John E. Thompson and Clarence W. Jameson, Chicago, Ill. App. filed Oct. 7, 1915. Used in connection with the control of elevator motors and the like.

1,256,951. **COOLING SPOT - WELDING ELECTRODE**; Elihu Thomson, Swampscott, Mass. App. filed May 29, 1917. Improvements.

1,256,958. **ELECTRIC HEATING FURNACE**; Edward E. Walker and John W. Cox, Erie, Pa. App. filed Jan. 2, 1917. A liquid electrode is utilized which diffuses the intense heat of the arc, thus prolonging the life of the electrode and so extending the heat area as to make it effective as a heating unit.

1,256,959. **METHOD OF HEATING**; Edward E. Walker and John W. Cox, Erie, Pa. App. filed Feb. 15, 1917. Utilizes an electric arc.

1,256,960. **PROTECTIVE ARRANGEMENT FOR ELECTRICAL SYSTEMS**; John F. Watson, Blackheath, England. App. filed Nov. 24, 1915. Consists of an arrangement of pilot or protective conductors and relays so interconnected or associated with one another that, while normally there is no complete circuit through any of the protective conductors, current derived by one conductor from the system through leakage which virtually establishes the circuit of a companion relay controlling a switch at one place will, through such relay, cause current to be conducted to the conductor or conductors of other relay or relays controlling a switch or switches at a distance.

1,256,969. **TEMPERATURE-CONTROL SYSTEM**; Frank Ahlburg, San Francisco, Cal. App. filed Nov. 4, 1915. Particularly adapted for use in an apparatus for marking fruit.

1,256,972. **SEPARATION OF MAGNETIC IRON ORE FROM THE ASSOCIATED NON-MAGNETIC OR FEELBY MAGNETIC MINERALS**; App. filed May 10, 1911. Improvements.

1,256,983. **WIRELESS TELEGRAPHY AND TELEPHONY**; Edwin H. Colpitts, East Orange, N. J. App. filed Jan. 27, 1916. Improved method for the simultaneous transmission of telephone and telegraph signals and for their reception.

1,257,015. **ELECTRIC LIGHTING SYSTEM FOR AUTOMOBILES**; Bernice J. Noyes, Boston, Mass. App. filed April 9, 1913. Improvements.

1,257,021. **RELOADABLE FUSE**; Ralph C. Patton, Providence, R. I. App. filed June 20, 1917. Strong enough to operate safely without filling material.

1,257,054. **ELECTRIC-WIRE COUPLING**; Courtland W. Weaver, Toronto, Ontario, Canada. App. filed June 19, 1917. Improvements.

1,257,075. **REPRODUCTION OF SOUND CHARACTERISTICS**; Percy W. Fuller, Boston, Mass. App. filed Sept. 30, 1910. Operates somewhat after the manner of a condenser.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER and AMERICAN ELECTRICIAN

Number 12

Output of Large Generating Systems

WE PUBLISH in this issue very interesting statistics on the outputs of the large generating systems of this country and Canada, representing approximately two-thirds of all of the central-station energy manufactured in 1917. The lessons to be drawn from the figures are many and varied. One in particular cannot be over-emphasized at this critical time when fuel conservation and important water-power legislation are under consideration at Washington. From time to time the central-station industry has been charged with grabbing all the water power in sight and playing the hog. Certain government officials have maintained that further water-power development was unnecessary because in some sections, particularly on the Pacific Coast and in the Northwest, overdevelopment of water-power resources could be shown. On this point the statistics published throw an interesting light. Facts are stubborn things, and how the facts in this case can be controverted we do not know. We do know that they belie the statements of the water-power obstructionists and that next year more fuel will have to be burned by hydroelectric companies because of the shortage of rainfall this winter on the Pacific Coast. Therefore any relief measures contemplated must be acted on quickly. As indicative of the immense saving of coal possible through the development of water powers, the statistics show an aggregate output of electricity from that source equivalent to the consumption of 25,000,000 tons of coal.

The Wages of Labor and Living Cost

IN THE discussion by L. K. Comstock, published in part in last week's issue and concluded in this issue, we have an earnest effort to perfect a reasonable solution of the labor problem in the electrical contracting industry. It is commended to our readers for the important lesson which it carries. The war is bringing momentous changes to the world. They touch for long-lasting good or ill the relation of massed capital and massed labor and also of individual labor and smaller units of capital. Mr. Comstock admits the issue frankly. His proposition is that it must be solved by intelligent, fair, logical methods, just to labor. Labor's standpoint is like that of the manufacturer whose production cost rises. Living cost of the workman has advanced, and if he cannot bridge the chasm between that cost and his earning power he faces a bankruptcy that is as perilous to him and to

the nation as the bankruptcy of the capital of the manufacturer. Either one threatens a catastrophe which it is our highest interest to avert. Sometimes business men of real integrity voluntarily increase payments under a contract price because they know that higher costs made the performance of the contract impossible at the stipulated figure without damaging loss. Many voluntary advances have been made; more will have to be made if present abnormal living costs and labor scarcity continue. The future will be made easier in the relations of labor and capital if capital, seeing clearly the needs of the hour, shows labor that it proposes to meet them fairly.

The Water-Power Bill

HEARINGS on this important measure are now under way, and we earnestly hope that the facts presented will lead to the rapid passage of the reasonable legislation which can well spring from the bill now under discussion. It would perhaps be impossible to draft a bill to satisfy everybody. Indeed, one of the best criteria of a really equitable decision of any kind is that all of the parties thereto should consider that they had been favored with only a partial victory. In the long run sound compromises can be made which will produce good results, even if not wholly pleasing to everybody concerned. The main thing now is to enact such a statute as shall encourage the speediest possible development of the hydraulic resources of the country. The nation has had a hard time during the past winter in obtaining its necessary supply of fuel; and it is not likely to have an easy time next winter in view of the heavy strain that may be expected on our already burdened transportation systems. Everything that can be obtained from hydroelectric plants is badly needed, and this is no time to temporize concerning the situation or to split hairs over the form of requirements to be embodied in the bill.

The main thing is to give those who would be glad to develop water powers a fair enough chance to hold their interest in the work and to encourage them to go at it immediately. Before the end of the current year it will be possible to put a very large amount of hydraulic power into service provided that the chance is given without further exasperating delays. The fuel situation is not likely to become much easier to meet before the close of the war, whenever that may be, and it certainly is a gross neglect of national resources to permit the continuing loss of valuable power. The obstructionists are in chief those who are attempting to force the government at once into the water-

power business as a national enterprise. The government has already enough on its hands in the necessary assumption of business more immediately concerned with the war to keep any reasonable official body busy to its heart's content. It might with great profit to the country take into its own hands temporarily still other affairs in which it is suffering from scandalous profiteering. In view of all this, and of the fact that the government will have control in the broadest sense of the operations of hydroelectric plants established on its domain, it seems scarcely wise to undertake in its own behalf their full financing and administration. We do not believe that the government is looking for trouble to this extent, and we most earnestly hope that it will give some reasonable encouragement to the conservation of fuel by passing promptly a workable water-power bill.

The Use of Synchronous Motors

THE synchronous motor, although at present used in a somewhat limited way, has certain virtues which commend it to the engineer quite apart from its very useful function in power-factor correction and as a voltage regulator. Its practical field of operations is well described in Will Brown's paper in the current issue, which will be rather an eye-opener to many engineers who do not fully realize in how many instances the synchronous motor has found application. On broad principles the synchronous motor has for its weakest points the need of an exciter for the field and a somewhat limited starting torque. Its strong points are its beautiful uniformity of speed, its power to carry stiff overloads and its generally useful effect on the power factor of the system. In addition, it is a general rule that a synchronous motor has a higher efficiency than an induction motor of the same output, particularly when the rotative speed is low. Hence it is that Mr. Brown shows that synchronous motors are likely to pay for their somewhat higher first cost after a short period of use, simply by reason of higher efficiency. The cause of this higher efficiency is obvious enough in the lessened hysteretic losses and in the lessened I^2R loss when the synchronous machine is used anywhere near unity power factor.

It is on account of the general requirement of an exciter and of a construction which adds considerably to the cost of the machine that it is not usual, as Mr. Brown correctly states, to find synchronous machines used, save for motor-generator sets, for outputs of less than about 100 hp. Above that output the lessened running losses score pretty heavily in its favor. Looking over the list of applications in the paper before us, one is immediately struck with the ready applicability of the synchronous machines to large pumps, either piston or centrifugal. These are quite universally started at light load by the use of by-passes or analogous means, thus overcoming one of the inherent failings of synchronous motors. With recent designs the starting torque has been materially improved, but it is still too low for picking up anything near the rated load. The torque per kva. is also relatively low, but so indeed it is in many induction motors of the squirrel-cage type. There is a general feeling that it is somewhat difficult to start up a synchronous

machine. In point of fact this difficulty is popularly rather exaggerated, since with the proper starting arrangements the rotor is quickly brought to speed and very readily synchronized, with only an insignificant chance of anything going wrong. There are, too, a great many kinds of work in which the load can be assumed by a clutch after the machine is at speed.

Air compressors and ammonia compressors in ice plants furnish admirable loads for the use of synchronous machines, particularly on account of the very material gain in efficiency to be secured by their use. In fact, one of the earliest applications of the polyphase synchronous motor was in driving the compressors of an ice plant. It is particularly well suited to this use because these compressors have not infrequently to work at part load and the efficiency curve of the motor can be kept considerably flatter than the normal efficiency curve of an induction motor. When direct-connected drive at low speed is desirable the induction motor is somewhat at a disadvantage, particularly in the matter of power factor. In all cases where a synchronous motor can be used under fairly steady load it stands a chance of getting a power rate bettered by the obviously useful effect on the power factor of the load, and even of the plant. The average power factor of a central station carrying a heavy load of induction motors is none too good even in these days of improved design, and the question of proper charges for the kva. demand required is one that is continually coming to the front. Mr. Brown's paper, with its comprehensive study of various applications, should prove a useful guide in planning for a combined load which will tend to keep up both the power factor and the working efficiency of the system as a whole.

A Simple Method of Measuring Emfs. Accurately

IN MEASURING the emf. generated by a thermocouple, so as to determine the temperature of the same, there is probably no apparatus so reliable as the potentiometer, provided that there is a suitable range for small voltages. In some potentiometers the range of precision in the first few microvolts is too narrow. A disadvantage of the potentiometer is that, being a zero-reading instrument, it takes some little time to adjust the potential for galvanometer zero. When a number of such thermocouples have to be tested in succession this process becomes slow and tedious. A more convenient measuring device in such cases is a millivoltmeter, which on being connected to the thermocouple under test speedily indicates the terminal voltage. If the thermocouple and its leads have appreciable resistance, the drop of potential therein may cause the millivoltmeter to indicate appreciably less than the true emf. It would be desirable to combine the convenience and rapidity of the millivoltmeter with the freedom from drop error of the potentiometer.

Two suggestions toward this object were offered by F. Wenner, P. D. Foote and E. E. Weibel in an article printed in our last issue. These methods lack the precision of a good potentiometer, but they are swift and convenient in operation. The precision available is probably in most cases satisfactory, and there should be no drop error. As adjuncts to the testing laboratory these methods are well worth noting.

Standardizing Factory Lighting

THE considerable increase in night work which has resulted from the war lays particular emphasis on the importance of the artificial lighting of factories. Prof. C. E. Clewell's discussion of the efforts to standardize suitable lighting for industrial establishments therefore has direct value at the present moment. The I. E. S. code of 1915 was a long step in advance and served as a basis for some important legislation. The experience of the last three years, together with the greater amount and severer requirements of factory lighting, has rendered changes desirable. These were undertaken last year by the I. E. S., and their importance has been emphasized by the recent legislation which Professor Clewell mentions. Changes in the original code have been in considerable degree due to the greater importance now attached to artificial illumination and to a considerable degree have been in the direction of a more complete classification of the work to be done. Another very important change has been to direct more specifically attention to the question of glare, always recognized as a very important factor in successful industrial lighting, but hard to reduce to workable definitions. Indeed, whether it is possible to draft a regulation of a kind practicably enforceable which will properly cover the subject of glare is a question which does not yet admit of a definite answer.

A longer step forward is made in the strong recommendation of actual measurements of the lighting by a portable photometer. At the present time instruments of this kind, of sufficient accuracy for the purpose and convenient for use, are readily attainable, and there is no reason why legislation as to industrial requirements cannot be worked to a successful result. The four desiderata in industrial lighting suggested by the committee on labor of the Advisory Commission—to wit, conservation of eyesight, safety, increased labor efficiency and better quantity and quality of output—are the obvious things to be borne in mind in codes and statutes. As regards the general conditions of lighting, those which satisfy the last two requirements will also satisfy the first two, with due attention to the lighting of stairways and other areas of that kind.

If the minimum lighting requirements are specified in accordance with the suggestions of the I. E. S. and can be enforced, as is comparatively easy by the use of portable photometers, the whole situation will be effectively cleared up. Heretofore it has been far easier to say whether lighting was or was not good than to pin it down to definite intensities of illumination. Now, with the problem of photometry somewhat simplified, the necessity of training state factory inspectors in the use of instruments and in the fundamental principles of industrial lighting becomes obvi-

ous. At present they will have much less difficulty than was the case a very few years ago, since manufacturers are compelled to do much work by artificial light and have come rather generally to realize at last the importance of good illumination as a factor in the general success of the plant. Very little pressure intelligently applied by legislation and its judicious enforcement will work wonders.

Increasing the Carrying Capacity of Underground Cables

IN THE electric circuit it is well understood that the difference of electric potential E produced by a direct current I in traversing an electric resistance R is expressed by Ohm's law according to the equation $E=IR$. In a similar way, there is a thermal law like Ohm's law, which states that the difference of temperature, or thermal potential, θ deg. C. produced by a thermal current F traversing a thermal resistance R is given by the corresponding equation $\theta=FR$. In the case of an underground cable the thermal current is determined by the loss of electrical energy in heat, so that F may be regarded as fixed by the electric current carried over the conductor. The temperature elevation which this F can develop depends entirely upon the thermal resistance in the path of its escape to surrounding bodies at normal temperature.

The thermal resistance between the conductor of an underground cable and the remote normal-temperature environment resides in the dielectric envelope, the air space between the cable and the conduit, the conduit walls and the soil in their immediate vicinity, all taken in series. A considerable share lies in the air space within the duct. The resistance in the dielectric and in the conduit walls may not be susceptible of change. What these offer in any given case may have to be accepted. If, however, the duct containing the cable be filled up with some cheap electrically insulating material of better thermal conductivity than air, the total thermal resistance R may be appreciably reduced, thereby reducing the temperature elevation θ of the cable; or, if the cable is thereby kept unnecessarily cool, the original temperature elevation may be retained, with a correspondingly larger electric current and thermal current F .

The article this week by E. O. Schweitzer describes an experiment in which the substitution of crude vaseline for air in a cable duct was found materially to diminish the thermal resistance and corresponding temperature elevation. It remains to be seen whether on a larger scale vaseline is a suitable substance for use in this way; but it is only reasonable to expect that some economical substance should be thus available for replacing air in underground-cable ducts, so as to increase the safe electric carrying capacity of the cable.

AMONG subjects which will be discussed in early issues of the ELECTRICAL WORLD will be the relative effectiveness of different methods of measuring internal temperatures in large generators, changing aspects of factory lighting legislation, relative costs of furnishing hydroelectric and steam generator power, increasing economy in boiler rooms, and improving the

The Coming Issues

starting characteristics of synchronous motors. An article will also be published presenting in systematic form, for the convenience of designing engineers, information on different safety features which have been developed for use in connection with switching installations. Lessons arising from the curtailment of lighting will be discussed.

What Synchronous Motors Can and Cannot Do

Discussion of Industrial Applications as Viewed from the Standpoint of Performance Alone—Power-Factor Improvement a Secondary Advantage

BY WILL BROWN
Electric Machinery Company

IN MANY discussions of synchronous motors the subject of power-factor correction and condenser capacity is mixed up with and allowed to overshadow the characteristics of motor performance. A motor should be judged, however, by its ability to perform a certain duty and should stand or fall upon this performance alone. If it is able to improve the power factor of the system, this characteristic may then be considered as an additional point in its favor.

SERVICE THAT SYNCHRONOUS MOTORS CANNOT GIVE

While synchronous motors as now designed are quite different from the modified alternators of older days, and can develop 30 to 50 per cent full-load torque at starting, there are certain duties they cannot perform. So as to clear up any misunderstandings that may exist concerning synchronous motors in regard to either their limitations or advantages, some of the purposes to which they cannot be adapted will be outlined first.

(1) They cannot be used profitably on small loads. This generally means anything under 100 hp. An exception should be made in the case of small synchronous motor-generator sets, however.

(2) They cannot be used on intermittent loads involving frequent starting and stopping, such as crane motors, reversible hoist motors, etc.

(3) They cannot be used where variable speed or adjustable speed is demanded unless some mechanical means of regulating the speed change is provided.

(4) They cannot be used where it is necessary to start up the full load from rest unless a clutch or some other mechanical method of easing the starting condition is supplied.

USES TO WHICH SYNCHRONOUS MOTORS ARE ADAPTED

In answer to the question which now probably arises in the reader's mind, "Where are synchronous motors now in use?" Table I is presented. It does not by any means cover the full field of possible applications, but it does indicate the already wide range of these motors and the promise of a much greater use in the future.

Where a heavy and fairly continuous load can be driven at a constant speed, there is generally an opportunity to install a synchronous motor. High efficiency and reliability of service are the two great essentials in such work. It is safe to say that a synchronous motor is always higher in efficiency than an induction motor of corresponding rating. At low speeds the advantage in favor of the synchronous motor is even greater than at high speeds.

There are many heavy-duty machines which must be run at low speeds. Formerly, if these machines were to be driven by motors it was necessary to install some form of belt or gear drive. They can now be

directly connected to synchronous motors and operate efficiently at speeds as low as 72 r.p.m.

Starting Ability.—The old handicap of synchronous motors was their inability to start up from rest while carrying a mechanical load. This handicap has been overcome to a greater extent than most engineers realize. There are practical examples of large synchronous motors developing a starting torque as high as 50 per cent of full-load torque obtained without a prohibitively large kva. input. The future will probably bring even more remarkable results.

It is a fundamental fact that a low-speed synchronous motor cannot develop as high an initial starting torque with the same starting voltage as the high-speed motor,

OVER-ALL EFFICIENCY OF DIRECT-CONNECTED CENTRIFUGAL PUMP

it being understood that horsepower ratings of the two motors are the same. For example, a certain motor with a synchronous speed of 200 r.p.m. can develop a starting torque of 35 per cent of full-load torque on the 40 per cent voltage tap with an input of 130 per cent of the full-load kva., whereas a 600-r.p.m. motor can develop a starting torque of 40 per cent of full-load torque on the 40 per cent voltage tap with an input of 115 per cent of full-load kva.

Variable Loads.—Many types of heavy-duty machines requiring variable output are now designed so that they can be started and driven by synchronous motors. For instance, in a certain reciprocating pump installation a variable stroke is automatically obtained by means of bell cranks and by shifting the cylinder. This permits varying the delivery from zero up to 4200 gal. (15,900 l.) per minute.

Mechanical methods for changing the inlet or outlet passages for fans and blowers permit the use of constant-speed motors where formerly only adjustable-

speed motors could be used. There are already a number of such installations—for instance, large exhaust fans such as are used on mine shafts, etc.—and it seems quite likely there will be many more in the future.

Line-Shaft Drive.—In cases where manufacturing processes are so correlated that a line-shaft drive is preferable to individual motor drive, the synchronous motor is finding wide applications. The motors may be either direct-coupled or belted. For this service it is nearly always necessary to use a clutch, either mechanical or magnetic, to permit starting and bringing the motor up to speed before the load is thrown on. The writer knows of a number of installations of this type in flour mills, also in rubber mills, all of them operating very satisfactorily and handling heavy loads, in which there are at times considerable fluctuations.

Efficiency and Ruggedness.—The high efficiency which can be secured with a synchronous motor is well

and the bearing repaired. Very frequently the windings of the armature are damaged also. The synchronous motor, owing to its comparatively large air gap, is much more rugged and dependable for operation on low-speed, direct-connected loads.

Air-Compressor Drive.—Air compressors, especially those of sufficiently large capacity to require 100 brake horsepower or more, can be economically and efficiently driven by a synchronous motor. The old idea that it was necessary to change the piston speed with change in air demand has been abandoned. Mechanical methods of regulation on the compressors now permit the driving motor to operate at a uniform speed.

In practice synchronous motors are used both belted and direct-connected to the compressor. On direct-connected units the speeds required are generally within the range of 260 r.p.m. down to 120 r.p.m. Probably the greatest number of direct-connected synchronous-motor-driven compressors operate at a speed in the neighborhood of 200 r.p.m. This speed is very much higher than was ever thought advisable by compressor builders a few years ago. The increased speed has been made possible by the adoption of a light plate valve with a low lift. The time required to open and close such a valve is so small that it permits operating the piston at much higher speeds.

In starting an air compressor the pressure can be relieved by a by-pass so that the motor has only the friction load and inertia to overcome in breaking the compressor from rest. This is very easily taken care of without drawing excessive kva. from the line, and the motor can pull into synchronism without causing objectionable fluctuation of the line voltage.

Since the load factor of a compressor is generally high, and since the power factor of a synchronous motor can be maintained at unity, a favorable rate can usually be secured when energy is purchased from a central station. The fact that these motors operate at unity power factor or slightly leading (at part loads) should appeal with even greater force to plants generating their own energy. The power factor and efficiency obtained with a typical direct-connected synchronous-motor-driven air compressor are shown in Table II.

Recently there has been an enormous demand for large synchronous-motor-driven air compressors among the shipyards of the country. They range in size from 150 hp. to 1200 hp. Among other lines of industries using synchronous-motor-driven air compressors might be mentioned mines, foundries, automobile factories, structural steel works; in fact, any industry where a large quantity of compressed air is used. In driving tunnels the air pressure can be maintained in the headings by means of a battery of low-pressure compressors driven by synchronous motors.

Ammonia-Compressor Drive.—The large ammonia compressors used in ice plants (50-ton or over) are driven in exactly the same way as air compressors, by either belted or direct-connected synchronous motors. The starting duty required is somewhat more severe than in the case of air compressors, however. In order to obtain the required starting torque it is sometimes necessary to use a higher voltage tap on the starting compensator than would be necessary with the corresponding air-compressor installation. The large flywheel combined with the inertia and friction

illustrated in the following installations: One marble-working concern has been operating a 150-hp. synchronous motor driving a line shaft for nearly four years. The choice originally lay between an induction motor and a synchronous motor. The higher efficiency obtained by the synchronous motor brought a saving in the first two years of operation which more than made up for the higher original cost of the synchronous motor.

There is a rather interesting installation in a paper mill where a 1150-hp. synchronous motor is driving two direct-coupled pulp grinders. No difficulty has been experienced either in starting or running. An induction motor of similar horsepower driving a similar load was caused more or less trouble, which is generally traced to the very small air gap. The slightest wear of the bearings alters the air gap sufficiently so that a very heavy magnetic pull is set up on one side of the motor and quickly wears the bearings down still more until the time arrives when the motor must be stopped

of other moving parts requires that the motor be specially designed to produce maximum starting torque.

The preference for direct-connected synchronous-motor-driven ammonia compressors is very markedly shown in the ice and refrigerating plants recently constructed or now in course of construction. It may be said safely that the energy cost with direct-con-

TABLE II—EFFICIENCY AND POWER-FACTOR TESTS OF 560-HP., 225-R.P.M. SYNCHRONOUS MOTOR DIRECT-CONNECTED TO AIR COMPRESSOR
Exciting current remaining constant at all loads

	Quarter Load	Half Load	Three-Quarters Load	Full Load	One-and-a-Quarter Load
Efficiency	92.6 per cent	95.6 per cent	96 per cent	96 per cent	95.4 per cent
Power factor	73 per cent Leading	93 per cent Leading	98 per cent Leading	100 per cent	98 per cent Lagging

nected synchronous-motor-driven machines is less per ton of ice manufactured than is the case with any other type of motor drive.

Once it was considered essential, in order to meet the varying demands for ice, that the speed of the ammonia compressors should be adjustable. This is no longer necessary. In place of one large unit running at variable speeds, ice plants can have two or more smaller units which run at constant speed. By running different combinations of the compressors in parallel, fluctuation in demand can be easily cared for without any provision for speed adjustment. When the demand drops to a minimum the smallest compressor only may be used, so the losses may be kept at the minimum. It can be seen that the over-all efficiency of such a plant will be very much higher than in the old-fashioned variable-speed plant.

Another method of varying the output of the compressor at constant speed is by means of an adjustable clearance pocket, or cylinder, at each end of the compression cylinder. By means of these the clearance can be increased and the capacity lowered to any desired point between full load and one-quarter load or even lower. Thus the flexibility of the compressor is fully equal to that of the old adjustable-speed compressors driven by low-speed Corliss engines.

The efficiency curve of the synchronous motors is quite flat throughout a wide range of load, so that

TABLE III—EFFICIENCY AND POWER-FACTOR TESTS OF 450-HP., 200-R.P.M. SYNCHRONOUS MOTOR DIRECT-CONNECTED TO AMMONIA COMPRESSOR
Exciting current remaining constant at all loads

	Quarter Load	Half Load	Three-Quarters Load	Full Load	One-and-a-Quarter Load
Efficiency	87.7 per cent	92.6 per cent	93.7 per cent	94 per cent	93.8 per cent
Power factor	70 per cent Leading	94 per cent Leading	99 per cent Leading	100 per cent	99 per cent Lagging

there is very little loss in efficiency on the part of the motor when run at part loads. As far as the compressor is concerned, the efficiency at part loads seems to be practically as good as at full load. This is due to the general conditions under which ice-manufacturing plants operate. The efficiency, power factor and starting torque for a typical synchronous motor direct-

connected to an ammonia compressor are indicated in Table III.

Direct-Connected Centrifugal Pumps.—Quite a number of installations of synchronous-motor-driven centrifugal pumps have been made recently. In most cases the motor is directly coupled (through flexible coupling) to the pump shaft. Starting requirements of a centrifugal pump can be met by a properly designed synchronous motor. Before starting, the pump is primed. The discharge valve is closed when the motor starts, so the impeller merely churns the water. The load increases rapidly, running up to 30 per cent, or even 50 per cent, of full load as the motor approaches synchronous speed. When full voltage is applied and the motor is pulled into step, there is a momentary rush of current, which, however, should not be excessive and should fall almost immediately as the motor settles down to synchronous operation. The maximum peak at pull-in should rarely exceed 150 per cent of the full-load kva.
